When someone emerges from a program with a Ph.D., what does that really mean? What are you going to have your doctorate in? Why are you doing your research on this subject? Where do you situate yourself in your field? What contributions do you want to make? Who are you becoming? How are you spending your time? In that sense, we're making some of the things that are implicit in the process very explicit. We're framing the whole thing as a creative process, and I think the results have been very interesting. On the one hand, it's natural, and students think it makes a lot of sense. On the other hand, it scares the bejesus out of them. It's arguably a lot harder and more challenging, but well worth it.

Recently, education has fallen into more of what I would call a reproductive approach, which involves reproducing what the faculty tells you to in order to get the grade. It's also reproducing a certain form of social organization and a way of being in the world. While students really like the idea of creative inquiry, typically they tend to have a little bit of an existential crisis, when they actually have to engage in it. It's the anxiety that comes with freedom. Because at the same time they're thinking, "This is exciting!," they're also thinking, "I may be free, and you may be telling me that it's good to be creative, but what's going to happen to my grade, and how do I know what I really like? Am I really creative? What do I really care about?" It raises a lot of deep questions. So inquiry and self-inquiry are inextricably connected.

Russ: *This reminds me of William Perry's work and his research on students in particular. He has a model that, with all its nuances, has a dozen or so different levels. His research showed—and this has been replicated in research particularly with engineering students in Colorado and Pennsylvania and probably elsewhere—that in a 4-year college education, students initially see the faculty member as the authority figure with the knowledge. During their education, they shift through several levels, and by the time they graduate, their locus of authority is more internal rather than external. Yet, I'm hearing you suggest that at the graduate level now, we still have the phenomenon—maybe socially inspired or inspired by the nature of the educational system—that even though I may have reached a point where I privately might rely on my own internal locus of authority, publically I need to continue to pay attention to the external one.*

Alfonso: Right. And this is the case all over the country. There's lots of new research about the way the Millennial generation has been educated, the implications, and the challenges they're facing after being hounded about grades. I like the reference to Perry's work, because I differentiate between what I call reproductive, narcissistic, and creative inquiry. If you break Perry down into those three main perspectives, it goes like this: In the beginning, or reproductive stage, the authority is all with the instructor. The next stage is where the students think it's all relative: with the collapse of authority, "the one right answer," they think anything goes. This is a practice that translates into the students feeling it's all about them, all about their feelings, all about where they are, their "subjectivity," all the stuff education formerly rejected—the return of the repressed, right?

(laughter)

But at the same time, at that stage they may not understand what counts as significant anymore, so they don't appreciate the value of tradition, craft, hard work, and so on. They don't appreciate that some statements may be more valuable than others and that leads to the more narcissistic stuff. Creative inquiry is about cultivating a much greater sense of context, more of a sense of collective self-creation. I think that's when things get really interesting. It definitely maps onto the Perry work.

The way I see it, it's about an ongoing process of creative inquiry, where the process is the product. I think this is similar to a jazz performance of a "standard" from the Great American Songbook, which offers an opportunity to perform together, to inquire together, to allow for the emergence of novelty from the interactions of the participants. The point is not to find THE answer, but to find ever greater opportunities to continue the inquiry, illuminating new dimensions of what may be a well known song, finding new forms of expression, new ways of being together and developing new insights into the material we're given. Are you Coltrane or Desmond, Miles or Satchmo, Elvin or Max, Jaco Pastorius or Paul Chambers, Herbie Hancock or Art Tatum, Ella or Sarah or Carmen or Betty or Kitty? Are you finding your own voice, and articulating new insights into the songs that can be meaningful and generative for you, for your context, for other people? That's our challenge.

Russ: *And this is what you're trying to foster at CIIS?*

Alfonso: It is—in the leadership program, in the doctoral program, and in my consulting work with corporations and artists.

Russ: *Alfonso, I thank you very much for our time together, and I hope this has been as interesting for you as it has been for me to hear the broad spectrum of work that you've done and the interests that you have.*

Alfonso: Thank you for giving me the opportunity to dialog with you; I've enjoyed it a lot.

The Return of the Perennial Philosophy. The Supreme Vision of Western Esotericism

By John Holman.
Watkins Publishing, 1st edition London 2008. Paperback, 172 pp.

Review by Roland Benedikter

This book tries to provide a short integrative picture of the Western esoteric worldview, seen as the historical basis of contemporary "experiential" spirituality. Holman's main hypothesis is that in the present epoch of a broad renaissance of traditional religion it is increasingly becoming necessary to know the main themes and features of the "empirical spirituality" of the West that have long been hidden in the background of its public sphere. "Empirical spirituality" is conceived as being opposed to mere "faith" and dedicated instead to "spiritual research" and "exploration" in "first person." To identify what the common ground (or the "supreme vision") of the very different Western esoteric streams has been in the last seven centuries shall enable the reader to help prepare the present culture of secular rationality for the "return of the perennial philosophy," and thus for a more balanced societal paradigm. "Perennial philosophy" is outlined as an experimental proceeding of opening up new empirical knowledge between realism and transcendentalism. According to Holman, this proceeding has always been equipped with certain methodological tools common to more or less all Western esoteric traditions in order to create experiential alternatives to collectivistic, myth-oriented religion.

The book consists of an introduction and three main parts divided in 13 chapters. The *Introduction* gives a brief overview of the studies carried out so far about the field mainly by means of a critical history of ideas, and depicts the "ethnomethodological" approach chosen by the author. This approach consists in studying the esoteric traditions "from within," i.e. in a consciously participatory and identificatory way, or as the author puts it, "as practitioner." Building on these methodological presuppositions, *part one* starts with an overview of the main currents of Western Gnosticism, among others Neoplatonism, Hermeticism, Alchemy, and Kabbalism. Most importantly, it tries to differentiate between traditionalism and progressivism within the historical esoteric efforts in Western culture. The focus of Holman's historical overview is hereby on Theosophy, which he interprets as being a kind of "historical knot" within the development of an "empirical spirituality" (chapters 1-4). The *second part* of the book tries to identify the "philosophical and spiritual center" of Western esotericism as an initiation process common, in diverse forms, to all its sub-streams and variants. This (according to Holman mainly fivefold) initiation process is exemplified in five rather descriptive chapters (chapters 5-9). Finally, the *third part* discusses the rise of a "spiritual psychology" in the 20th and 21st centuries, mainly through the approaches of Carl Jung, Roberto Assagioli and Ken Wilber. The author purports that this "spiritual psychology" seems to be nothing else than a derivate (as well as the necessary next historical step) of the history of Western esotericism. Holman tries to depict this "new discipline" as the main contemporary form of Western spirituality, as well as a decisive

SOME RIGHTS RESERVED

"psycho-philosophical" contribution to the "change of worldviews" urgently needed by a world in crisis (chapters 10-13). In the future such a "spiritual psychology" has to be included in the general societal self-concept of a modernity that goes beyond the fallacies of "postmodernity" and "progressivism," but also beyond those of "premodernity" and "traditionalism."

Holman's book has its indisputable merits. The structure of his book is clear and precise, and the author proceeds with great security from one step to the next. No previous knowledge is needed for the reader to follow his arguments. The discourse Holman chooses is inspiring to get a first impression of the field, especially for beginners, who are endeavouring in their first contact with the topic. The book invites the reader to discover a whole new "intellectual continent," and to start more in-depth studies afterwards.

At the same time, like most similar approaches, and like it is maybe unavoidably inbuilt in an endeavour like the one dared by the author, the book presents several problems. These problems can be classified as implicit and explicit ones. Let me shortly come to the *implicit* ones first.

1. The book seems to be ridden by an "unconscious inner dispute" about its center, and this dispute is constituted as a kind of paradox. On the one hand, the book is visibly concentrated on recent (post-New Age) Anglo-American concepts and developments in the (self-)interpretation of esotericism. Only very seldom does it include the Continental European traditions. For example, Freemasonry, as the most important current which helped to give birth to the French Revolution as well as to the American constitution, is hardly mentioned at all, and certainly not appropriately included. Similarly, Anthroposophy is in essence subsumed under Theosophy, which means to oversimplify things. On the other hand, the book constantly mixes Western and Eastern approaches, without discerning them appropriately, and then simply classifies them as "Western." Even if the book is explicitly entitled "The supreme vision of Western esotericism," it claims, for instance, that Ken Wilber's theory of the subtle states of awareness is a current central cornerstone of it. But most of the observers would rather state that in reality most of Wilber's findings, methodologies and especially of his guiding terminologies have been drawn – even if rather eclectically – almost exclusively from the Eastern traditions. Most of Wilber's writings are of clear Eastern inspiration and terminology, and do not present sustainable traces of the main currents of Western spirituality, especially not of Freemasonry, Rosicrucianism, Theosophy or Anthroposophy, of which Wilber seems to have only little knowledge (which may be one reason why he has so far not found a durable access to the mainstream of academic research and teaching in European-Western culture). Cf. his exemplary negative judgement on Rudolf Steiner just in a brief footnote (sic!) in "Sex, Ecology, Spirituality" (1995).

2. A second problem is that the author is not "scientific" in his approach, but "identificative." The approach chosen by Holman is in principle logically understandable and maybe even methodologically needed; but it is carried out in an at least partially questionable way. The cadence of the work is one of a private expert speaking as part of a community, not as an academically embedded scholar dedicated to a sound "subjective-objective" exploration. Holman seems not to ponder things from the standpoint of the necessary "epochè," but often falls into a style dangerously close to propaganda. That is mirrored by his sometimes vague, and in general rather literary than scientific use of terms (for example, "the virus of postmodernity," "quantum leap ... of esotericism" etc.). Holman is repeatedly even polemic against academic scholarship,

and this will most probably not be helpful for the establishment of spirituality as an academically accepted (and funded) topic.

3. Related to that, the author rarely addresses his main guiding concepts – such as “evolution of consciousness” – critically (and thus, as the standards of current academic scrutiny would demand, dialectically). By not doing this and rather departing from an “identity position” of concepts, Holman tends to give his own interpretation of concepts as *the meaning* of them. This may be inspiring for the beginner, but it is not accurate. This fallacy is especially noticeable in part two of the book which tries to address the alleged “four main Enlightenments” of the “philosophia perennis,” which are depicted as being common to all sub-currents of Western Esotericism. But this basic assumption could be seriously challenged by a deeper look into the history of ideas and esoteric practices. Most probably, some of Holman’s descriptions in this regard would not be unquestionably endorsed by any other movement within Western Esotericism except by his own.

4. These implicit problems now culminate in one aspect that I personally regard as crucial to be addressed in further similar attempts. It is the fact that there is no such thing as an “identity in itself” of no philosophical or esoteric approach in history, be it as “perennial” as imaginable. From the standpoint of the contemporary history of ideas, more emphasis must be put on the fact that within every current of thought, be it considered at the typological macro-level or at its factual reality-level, there is, has been and will most probably always be – with no exception – a constitutive dialectics between at least two sub-streams in its inside, which battle each other for the overall direction of the thought and its methodology. That is valid also for “integral” thought and practice. There is no “integral theory” as such, but there are many claims for it, which must be understood out of their contextual relationship with various constituents. This seems to be a decisive aspect to me, especially if seen from a contemporary perspective like the one voluntarily chosen by Holman. It is crucial for the sheer quality of the debate both in a public and “internal” perspective. I think there is a self-identification of Holman’s perspective as *the* perennial philosophy inbuilt in his basic aspiration, as well as implicit in the basic attitudes of most of his main doyens, including John Huston, which hinders their “philosophies” to become an accepted subject of discussion. And it is this attitude that most likely creates part of the existing problems for the development of a truly contemporary “philosophia perennis,” because it is due to this attitude that many of the streams and currents that identify themselves as being “integrative” or “perennial” battle each other, instead of seeking exchange, and integration among them.

5. That is, from my viewpoint, one reason why in its present form the book of Holman can hardly give a sustainable impulse to the discussion neither about nor within the field, not even at the present moment when the “global renaissance of religion” would indeed provide a valuable (counter-)framework for a “return of the philosophia perennis.” Holman’s book does not differentiate in its attempt to unify. To insinuate, for example, that Wilber and Tarnas are saying mainly the same things, will hardly be confirmed by neither of these authors. If the inner differences and conflicts within the currents that would call themselves today being part of the “philosophia perennis” are not addressed, no “unifying picture” will be accepted by a satisfying number of potential participants.

Among the *explicit* problems, I would like to mention only two:

1. The book presents no satisfying differentiation between experiential, religious and "rationally enlightened" sub-currents in the field.

2. The organization of the book is slightly unbalanced. Out of 164 pages of text, 32 are dedicated to footnotes, which means roughly a fifth of the book. The Index seems to be similarly over-detailed if compared to the grade of detail and to the overall length of the main text. It causes an impression of over-condensation of the text, and thus of over-simplification.

Holman's book seems to be written in a rather "New Age" mood and style. If compared to other similar, but much more elaborated and "deep" titles, such as Wouter J. Haanegraaff's *New Age Religion and Western Culture. Esotericism in the Mirror of Secular Thought* (State University of New York, SUNY Series on Western Esoteric Traditions, 1998), which Holman himself quotes in the methodological part of his introduction, or to Helmut Reinalter's *Die Freimaurer* (Beck Verlag, Munich 2001), Holman's book does not seem to be sufficiently competitive. This is because it is not balanced, "distanced" and scientific enough. Holman's book tends to oversimplify things, and it seems not to be able to satisfactorily represent the variety and complexity of the field addressed. Instead, it often falls into identifications with particular interpretations. That would in principle not be a problem, because it is probably inherent in the very difficult (if not impossible) attempt to give a short and introductive "unifying picture" of Western "Empirical" Spirituality as such. But it becomes a problem when Holman tries to sell his particular interpretations as *the* philosophia perennis.

To sum up, Holman's book is an interesting, but incomplete contribution. It is unable to sketch a sustainable outline of how to mutually include Rationality and Spirituality for the years to come. On the one hand, Holman's discussion about the future relationship between "Postmodernity" and "Spirituality" (chapter 10) presents some potentially fruitful elements. On the other hand, Holman's book is no substitute for more scientifically sound and in-depth investigations that still have to be written. It cannot be considered as representative for the field, and it is not of an appropriate erudition to claim to be a satisfactory introduction to it as a whole neither. It is, at its best, a good representation of a partial (self-)interpretative approach *within* the very differentiated and diversified streams of the philosophia perennis.

Roland Benedikter, F. Prof. Dott. Dr. Dr. Dr., *is European Foundation Fellow 2009-13, in residence at the Orfalea Center for Global and International Studies of the University of California at Santa Barbara as the Foundations Research Professor of Sociology, and Visiting Scholar 2009-10, The Forum on Contemporary Europe, Stanford University.*

Journal of Integral Theory and Practice

The *Journal of Integral Theory and Practice* (JITP) has published its summer issue. Authors explore online education, sexual identity, international development, gender and the integral community, and more. Our best-selling issue on Integral Coaching, guest edited by Joanne Hunt of Integral Coaching Canada, is also still available. Visit the Integral Life store for information on how to subscribe or to obtain individual issues.

JITP is the official academic journal of the Integral Institute. Scholars from a wide variety of backgrounds contribute articles, case studies, reflective pieces, empirical studies, and critical views. JITP is committed to the refinement, development, and expansion of Integral Theory.

Integral Education Seminar

There is still room left in the Next Step Integral's Integral Education Seminar August 2-7 near Seattle (http://i-edu.org/). IR Editors Jonathan Reams and Tom Murray have been involved in prior years IE Seminars, and speak highly of them as a places to learn, network, and build community around topics of "integral education" in its broadest sense. The venue, held at a remarkably beautiful retreat center on Whidbey Island, will give participants opportunities to interact with Susanne Cook-Greuter, Terri O'Fallon, Terry Patten, Craig Hamilton, John T. Kesler, and other leaders.

Integral Leadership for Sustainable Evolution

Important UPDATE: Now **welcoming all ages** :-)

Let's go in deep!
Check www.experienceintegral.org

* The seminar for emerging leaders and change makers all over the globe!
# 4-9 August 2009, Venwoude, the Netherlands!
€ 695,- / € 795 ALL-IN: 6 days organic food and lodging, and training fee.

Our PURPOSE for this event is to **assist emerging leaders and change agents worldwide** (consultants, politicians, artists, bankers, students, entrepreneurs, etc) with **taking the next step in offering their contribution to a sustainable evolution on our planet.**

--> Go to www.experienceintegral.org to view the inspiring program and find out more!
--> If you are ready to register, go to http://shop.experienceintegral.org/seminar.html

Public Letter in Response to Z. Stein and K. Heikkinen's

June 2009 *Integral Review* article (V5, N1, p. 3-24)

"Models, Metrics and Measurement in Developmental Psychology"

by William R. Torbert, Professor Emeritus, Boston College

Sent initially to the ***Integral Review*** *Newsletter*, Z. Stein, K. Heikkinen, S. Ross, J. Reams, and other scholar/practitioners whom I think of as having a direct interest in the LDP instrument: S. Cook-Greuter, D. Rooke, E. Herdman-Barker, R. Livne-Tarandach, A. Nicolaides, D. McCallum SJ, H. Bradbury, B. Morrill, J. Sabbage, S. Taylor, K. Merron, J. Hartwell, K. Yeyinman, G. Young, N. Wallis, C. Palus, J. McGuire, E. Kelly, J. Rudolph, P. Foster, M. Krot, PCT …

I welcome the intent of Zachary Stein's and Katie Heikkinen's June 09 ***Integral Review*** article: To generate further sharing of quality control information in regard to the development of usable knowledge in the field of developmental psychology.

Having myself vowed to write nothing more 'academic' starting in 2009, I limit myself to this informal letter referring briefly to a few historical and more recent types of reliability and validity testing conducted on the Leadership Development Profile (LDP), with references, in an attempt to invite further written work on these matters, but never again by me.

I also want to take this opportunity to invite Zak and Katie, as well as any of you with a continuing scholarly and practical interest in the LDP who hear about this invitation in time, to join me at my home for a day of study of the extant LDP-reliability-and-validity literature and of the continuing challenges, as I pass on whatever I can of this work to others of you…

(the time and place, more specifically, is 138 Parker St, Newton MA, 11am-5pm, Saturday October 3, with a good drinking/eating/music/dancing party afterwards

> for those who so wish [I'll try to get one of my sons to play his guitar and I'll get Pacey Foster to d-j]. Let me know if you're answering 'Yes.'
>
> > On the academic-writing front, it's up to any of you who are so motivated to pursue these matters after this and after the Oct 3 work/party (tho I will be more than happy to provide leads and materials if I can, as well as to speak by phone). Please let me know if that Oct 3 date seems attractive; those of us coming can design it together.

Turning to Stein's and Heikkinen's overall discussion of models, metrics, and measures, it seems to me excellent as far as it goes… **but** in my view stops short of some of the critical validity and practical/ethical issues of the human sciences, as I will suggest below toward the end.

In addition, while you two authors are commendably clear about the limits of your exploratory empirical study of the validity of certain specific developmental measures, it turns out that, at least from the point of view of my now-completed scholarly career, your methodological limits have resulted in a profoundly inaccurate portrayal of the validity-testing-history-and-published-literature in regard to the Leadership Development Profile (LDP)…

> (While at the same time confirming your very own new measure you've recently begun developing as best of all…).

> (The alternative hypothesis should certainly also be conceivable to a professional social scientist: at its most personally provocative, as I guess you'd expect a 180- degree-opposite alternative hypothesis to be, the alternative hypothesis = that *my scholarly career would best be left in deep shadow* for at least a while longer, maybe always, in the scholarly/academic world of leadership, organizational transformation, integral-quant-qual-&-action-methodologies, etc.).

At the same time, there is no doubt that the validity testing background of the LDP has long grown slowly in deep shadow, not widely recognized in the psychometric, psychological, sociological, political science, or leadership-studies literatures (an exception is McCauley et. al., 2006)… So this is a great last opportunity for me to bring additional attention to this body of work.

Based on your way of reviewing data, you – Z & K – found no Leadership Development Profile (LDP) validity studies. In a footnote, you state that although some LDP-based studies [e.g. Rooke & Torbert, 1998] cite Loevinger's studies as confirmation of the LDP's reliability and validity, "Loevinger's studies are out of date [new raters, scoring criteria, and levels are now used; metrics need to be re-calibrated], so they are not included here."

Thus, in a reversal of the story of 'The Emperor With No Clothes,' the review apparently discredits the Leadership Development Profile (LDP) measure as 'all public costume' and 'no scientific body underneath' (and many readers are likely to take that as gospel & inquire no more).

As I reflect on this matter, I find it both ***surprising*** and ***unsurprising*** that you found no validity studies of the LDP… Given the way you searched…

It seems ***surprising*** in that at least one of you – the tall one – attended a conference session last summer at which I and several colleagues presented a prize-winning paper on a wide variety of validity-testing studies on the LDP, which in turn referred to my most recently published book (***Action Inquiry***, Berrett-Koehler, 2004), which contains an 18-page appendix on the history of the LDP, with references to a number of quantitative studies using, and testing particularly the external validity of, the LDP. (It almost seems, Z, as though you reacted to something about that event that made you counter-dependently ant-agon-istic…???)

> External (field, catalytic) validity is arguably least demonstrated by other developmental measures heretofore and is arguably the crowning validity consideration, as well as the most relevant to the practical ethics of using the measure responsibly in the worlds of practice (see brief examples below).

In regard to ***Action Inquiry***, it is also noteworthy that the first listed associate author of the book is Dr. Susanne Cook-Greuter, a research scholar with whom I collaborated directly for 25 years and whom the authors properly credit with validity testing (Cook-Greuter, 1999) on what is now a somewhat distinct version of the measure (her SCTi / MAP)… but which was, at that time, the same measure. Hence, your article does in fact cite some validity-testing evidence in favor of the LDP without realizing it does so. Moreover, the validity testing work on the LDP has now extended since 1980, so your assumption – Z and K – that the validity tests of the Loevinger form conducted in the 1970s and 80s are irrelevant to the LDP proves false. Our own early validity testing (e.g. Merron, Fisher & Torbert, 1987; Torbert, 1987) was done at that very time based on the Loevinger form validated at that time (see further qualifications below). Thus, your dismissal of the 'old' Loevinger-related reliability and validity evidence is unjustified, since we were conducting field/catalytic/external validity data at the time, 'tho o' course u wrn't f'll'w'ng th' action @ th time. In fact, despite all the changes among the original and revised WUSCT, the SCTi / MAP and the Harthill LDP, I bet they would show a beyond .80 correlation with one another.

As we can already see, the situation in the field may not be immediately transparent to new entrants… So, there are several reasons why it seems ***unsurprising*** to me that you two found no validity studies of the LDP, given the way you were consciously looking (i.e., in 3rd-person terms, 'given their empirical methodology')… And why this is therefore a useful opportunity to respond to your own repeated and praiseworthy invitation to make this information more widely available for study to other scholars:

First, although Susanne Cook-Greuter and I began working in tandem some thirty years ago to apply and re-craft Loevinger's sentence completion form (also called WUSCT, of which SC-G is a high-reliability senior scorer) to issues of management and leadership… The measure itself was not renamed the LDP until some 20 years later…

> (Our delay was mostly based, I believe, on our collective humility in relation to Loevinger's achievement (even tho' many o' us viewed it as slightly less than the contributions of Plato/Hegel/Marx/Kierkegaard/Freud/Jung/Piaget/Erikson/ Kohlberg/Gilligan (my favorite dance-partner-when-twirling-on-Appian-Way)/Wilber/Kegan, et al.)

A second reason why it is ***unsurprising*** that you missed relevant validity studies of the LDP is that most of our early tests were parts of studies conducted on the external/field/catalytic validity of the measure (based on the relatively well-established internal validity and reliability findings at that time). Thus, they appeared in peer-reviewed journal articles, book chapters, and books about substantive findings from catalytic/field experiments… and not in articles focused primarily on the psychometric properties of the metric itself (e.g. Fisher & Torbert, 1991; Rooke & Torbert, 1998; Torbert, 1987; 1991; 1994; Torbert & Fisher, 1992). Someone(s) may yet author a ***JAP*** or ***JPSP*** or other psychometric journal article on all this…

> (My current hope/bet is on a collaboration between two doctoral students, among the recipients of this communication, who have yet to meet each other thru any medium so far as I am aware [and who, as young mothers at least, with strong connections to Asia Minor, have much in common]… but many other successful collaborations amongst others of you receiving this note are also easily conceivable…)

A scattershot outline of some of the studies and findings related to the LDP include (and I am phrasing each summary in as different language from the first publication as possible, so that comparing the original report to this one will reveal the most additional information possible):

1) An n=281 field study (Torbert, 1994), during which all participants were invited to request feedback on the LDP measure's findings about them, if they so wished. A larger proportion at each later developmental action-logic asked for feedback, a perfect 1.0 correlation on a Spearman Rank Order test, assuming the theoretical prediction that later, post-conventional-&-inter-dependent action-logics are increasingly open to (and increasingly seek out) single-, double-, and triple-loop feedback and learning. Understood this way, the finding supports both construct & external validity).

2) An n=96 (in 16 task-teams) field study (Torbert, 1987) shows that those teams (5 of 16) with one or more members measured at Strategist (8) outperformed teams with no one measured Strategist in three ways: in terms of bottom-line effectiveness, and in terms of members' perceptions of efficient time-use and greater within-group support for own learning.

3) In an n=177 field experiment over 22-months (Torbert & Fisher, 1992), only 3 of the 177 organizational participants who enacted the many developmental instructional technologies embedded in the organization's regular functioning (which included rotating team leadership roles, 360 assessments, developmental coaching, etc.) during their first 11 months transformed a full developmental action-logic after the full 22 months, according to the LDP. **By contrast, 15 out of 16** of those organizational participants **who** did all the above *and* ***also volunteered for and won*** a non-remunerative consulting role with new teams, during their 2nd 11-month participation (including depth-clinical training and processing on a weekly basis), **did transform**

a full developmental action-logic. This finding accounts for an unusually high proportion of the variance (81%, Goodman & Kruskall's tau) of the participants in the field experiment who are measured as having experienced a transformation of action-logic. The results seem a good test of the test-re-test reliability of the instrument, since only about 10% of the sample changed its score. The overall results also seems to document the transformational efficacy of a late-action-logic type of organizing ('liberating disciplines' [Torbert, 1991]) that interweaves voluntary commitment, depth mutual inquiry practices, and the practical demands of real business clients… with the intent of generating adult development.

4)In an LDP study of 10 CEOs and their Lead Consultants in 10 organizations attempting to transform (Rooke & Torbert, 1998), only the five CEOs measured at the Strategist (8) action-logic reliably succeeded in generating organizational transformation (accounting for .42 of the variance at a .05 level, Spearman Rank Order test).

In this case, of the four Lead Consultants, three are measured at the Strategist action-logic, one at Alchemist. As theoretically-predicted, in the five cases when the CEO is measured as at an earlier-than-Strategist action-logic, only the consultant measured at the Alchemist action-logic succeeds in supporting the two organizations that nevertheless succeeded in transforming. The 2 non-Strategist CEOs matched with Strategist Lead Consultants made some money but no sustained transformational change in the two organizations they were involved with. And, in the case of the Diplomat CEO [the earliest-recorded action-logic], who was paired with the Alchemist action-logic Lead Consultant, the consultant resigned after the CEO and Board Chair chose **not** to act on the consultant's recommendation that the CEO resign or be fired; 6 months later an ethics crisis that the Lead Consultant had known was brewing led to the firing of the CEO; the organization regressed two action-logics (as understood thru the Developmental Action Inquiry approach, an organization makes semi-permanent regressions easily, whereas an embodied person regresses only temporarily (and for shorter amounts of time the later the action-logic (McCallum, 2008).

Thus, if one adds the LDP scores of each CEO/Lead Consultant duo, then the combined influence of their action-logics accounts for 59% of the variance (at a .01 level, on that same Spearman Rank Order test) in whether the organization succeeds in transforming. The small sample size and the non-parametric statistical test highlight the construct and external validity of the measure as a metric that properly distinguishes among individual cases. I know of no evidence that any other developmental measure has tested or attained this kind of field/catalytic/external validity and would actually examine any such purported evidence carefully (see appendix of Torbert & Associates, 2004), perhaps surprisingly, given my vow not to write about these matters in a systematic academic sense again, but not inconsistently.

5)A more recent example of testing the construct validity of the current version of the LDP, entailing an n of 891 LDPs (830 [93.1%] scored as 'Conventional'; 61 [6.9%] as 'Post-Coventional' [Livne-Tarandach & W. Torbert, 2008]) found two qualitatively different factor analysis structures between the two sub-samples, as the theory would predict: the Conventional sub-sample shows eight *distinct* factors, with different stems clustering in different factors; by contrast, the Post-Conventional sub-sample shows 11 *interwoven* factors (we are informally calling it the 'spaghetti-and-meatballs' graph), with more than half (52%) of the stems loading on two factors or more (9 on 2, 7 on 3, and 3 on 4).

> These findings, we propose, suggest that – while Conventionals group stems in stable themes (e.g. 'leadership,' 'feminine,' 'power,' 'rules,' 'feelings,' or 'family') or larger stable categories (e.g. 'work' or 'emotions') – Post-Conventionals, by contrast, tend to link different stems together at one time or another, "flocking" differently at different moments. These two, very distinct types of thinking remind us of Plato's two images of the nature of thought (in his ***Thaetetus***): as either 'marks on the wax tablet' of the mind, or as 'birds flying about in the aviary' of the mind. Put differently, Conventionals' loadings represent a relatively simple mental map, with Aristotelean-ly distinct, independent categories ("nothing can be both A and not-A"); in contrast, Post-Conventionals' loadings suggest an ongoingly-dynamic, mutual-systems-oriented, inter-independent, 'living' mental mapping process, more at home in contemplation of Plato's dialogues..

Overall, the strength of the external validity testing of the LDP is that a range of different kinds of studies

> (lab and field experiments, field surveys, interview studies anchored by LDP scores, and real-time-studies-directly-implicating-the-researchers-and-their-clients themselves [see e.g. McGuire, Pallus & Torbert, 2007, or Hartwell & Torbert, 1997a & b))

find consistent theoretically predicted and theoretically explainable results and sometimes account for an unusually high percentage of the variance in the process. More recent validity and reliability are available in Torbert et al (2008).

This note has become too long, but I also want to bring to your attention a third reason that I believe helps to account for a mismatch between where and how Stein and Heikennen looked for LDP validity tests and where and how such validity tests have actually appeared in the scholarly literature. This is that, in part by using the developmental 'paradigm of paradigms,' I have also, with my closest colleagues and friends, been attempting to embody a late-action-logic paradigm of social science in my work. This Developmental Action Inquiry paradigm (Torbert, 2000a and 2000b) makes, not only the 'language' turn, but also the 'action' turn (Reason and Torbert, 2001; Chandler & Torbert, 2003) into studying oneself (1st-person research) in action with others at their invitation (2nd-person research) in relation to broader 3rd-person organizations and 3rd-person empirical measures.

As part of making this possible, Cook-Greuter and I (along with David Rooke and Jackie Keeley of Harthill Consulting Ltd.UK and eventually others, such as Elaine Herdman-Barker) radically improved the measure's face validity (or 2nd-person validity) for working people in general receiving feedback on their performance on the measure (and for legally-oriented human resources departments that didn't like being challenged by employees about the peculiarly-gendered stems in the Loevinger instrument). We did so by substituting four independently-validated work-related stems which have proved to have higher item/profile correlations than the earlier Loevinger stems substituted out (thus improving internal reliability overall). We also improved face/2nd-person validity by translating a lot of Loevinger's titles and evaluative terms to more neutral/descriptive terms (e.g. 'Conformist' to 'Diplomat' [formerly 3, now 4 in the common numbering system). We also developed the theoretical rationale and work-related description of the Technician/Expert action-logic, which was the modal score among all our managerial samples (and was then an unnamed ¾ transition; now 5 in the common-numbering system). Later, we did the same for the Individualist/Pluralist [7] action-logic. All of these changes have been critical for the possibility of using the measure effectively and ethically in action research with co-participants in field settings, such as the research at the 10 companies summarized above.

Of course, validity testing of various kinds needs to, and is, continuing on the LDP. But I hope that the foregoing comments, as unsystematic as they are, arouse a new kind of interest in this particular measure, as well as in the broader issue of transforming the social sciences from pallid versions of the old-fashioned physical sciences that exercise ethically-objectionable unilateral power over subjects… into ethical forms of action research that empower co-participants and generate new forms of mutual and transforming power.

Reply from Zak Stein

RE: Reply to Torbert and frame-up for *Integral Review* readers.

My paper (with Katie Heikkinen.) in the current issue of *Integral Review* is, in part, a call for discourse and collaboration between researches in developmental psychology concerning the validity and reliability of the metrics they use. Bill Torbert has been the first to respond to this call, and we are grateful for his thorough and insightful response, in particular his discussion of ecological validity. We hope his letter will not be the last and that others might take the peer-reviewed route, choosing to publish a more formal article in *Integral Review.* Nevertheless, the content of Bill's response is exactly the kind of thing we are looking for.

The story we tell in our paper is incomplete—as we note explicitly—and we offer it as simply the first word in a longer conversation, the goal of which is to inform a kind of information clearinghouse and educative resource about the wide variety of developmental approaches available (more on this below).

We will address the details of Torbert's response (and the responses of others) in a second publication to be written over the coming months. For now I will say, in passing, that developmental metrics can be divided into those *calibrated* for use in assessing individuals and those that have not been, and thus can only claim to be useful for research purposes. This is a distinction we explain in the paper, where we discuss the fact, for example, that Loevinger claimed that her metric was not reliable enough to be used in assessing individuals. The studies Torbert describes, although they provide evidence that developmental level predicts leader behavior—very important— provide no insight into whether or not the LDP is statistically reliable enough to justify its use in individual assessment.

When it comes to individual assessment, statistical reliability is a central concern, because it tells us how confident we can be that the score awarded to a performance is close to the test-taker's "true" score. For example, if a developmental assessment that is designed to measure 7 levels has a statistical reliability of .80, an individual who receives a score of 5 has a *true* score of 5, + or - 2 levels—somewhere between 3, and 7. The ideal statistical reliability for an instrument designed to detect 7 levels is .96. Even then, an individual who receives a score of 5 could have a true score between 4 and 6. (A research *instrument* with a reliability of .80 is good enough for studying group trends, but *assessments* are generally required to have reliabilities of .90+).

Of course, all assessments should measure (1) what they claim to measure (construct validity) and (2) something of importance (ecological validity), and human-scored assessments should also be associated with appropriate levels of inter-rater reliability, which must be continuously re-evaluated.

So this is the kind of difficult conversation we are trying to have—both technically/conceptually difficult and politically/emotionally difficult. The rest of this letter is an attempt to clarify why this conversation is important to have right now—why it is worth having despite its difficulty. I offer the following thoughts in order to clarify, as I did in *Integral Leadership Review*, the broader context that has me worried enough to take on the role of *l' enfant terrible*.

The United States has one of the largest and most complex educational systems in the world. This is a system that began to take in its current shape after the Second World War, influenced by a confluence of factors, including the birth of psychological testing. We now face a complex polycentric testing infrastructure that affects the lives of millions of children, adolescents, and adults every year. The sheer size and importance of this infrastructure makes it an unprecedented and incomparable example of applied psychology. But it is run by private companies providing a product that serves an irreplaceable public function in the educational system, which has led many to posit the specter of a *standardized testing industrial complex*. Moreover, the type, quality, and purposes of existing tests are highly questionable. They are not built by developmentalists or learning scientists; they can function only as sorting mechanisms for allocating rewards or punishments; they set drastic constrains pedagogical options; and they are administered in high-stakes contexts, etc. And this testing infrastructure is continuing to grow.

The rapidly increasing complexity of our world has forced the educational system to expand vertically, where it has diversified greatly. The task demands of key roles in society are becoming increasingly steep, requiring life long learning, either in graduate school, through various professional development mechanisms, or through coaching/therapy, etc. In post-industrial economies, individuals must be educated longer and to higher levels, and some, depending on their role, can never stop learning. This new educational frontier is accompanied by a burgeoning testing infrastructure. Diverse applications of psychological testing are proliferating, serving a wide variety functions.

This emerging arena for applied psychology could begin to look a lot like the testing infrastructure that dominates the world of schooling. It has not yet become legally and institutionally entrenched, but it will. Accountability mechanisms will be extended to higher education. Industry and government will be forced by a host of global problems to see that all organizations need to build in sophisticated mechanisms for life-long learning and social role allocation.

In this light, the call for quality control becomes clear, I hope, as does the need for rigorous discussions about psychometrics. We need to be at least as rigorous—if not more rigorous—than the existing psychological testing juggernauts, if we are going to have any say in shaping the large scale application of psychological technologies.

I am leading specific efforts (along with Theo Dawson) at Harvard and elsewhere to re-design the testing infrastructure for the public education system. We are piloting new developmental testing infrastructures in a network of research school collaborations and working to stimulate discussion about testing in the public sphere (I invite you to participate in this initiative by taking The National Testing Survey at: www.testingsurvey.us).

My efforts in the field of adult development have been focused toward the Integral community (broadly defined), wherein there is a profound call for innovation in applied developmental psychology. My efforts have been mainly discursive so far. But the series of publications I have offered on this topic have consistently called for action. I am currently taking steps—with Katie Heikkinen, Sara Ross, Robb Smith and support from a network of academics, consultants, and psychologists—to build an information clearinghouse and educational resource about developmental approaches. This will be a website designed to foster collaboration and transparency between researchers, between researchers and the consultants (etc.) who buy their wares, and between researchers, consultants, and the public. The information will focus on reliability, validity, and the ethics of application. This project will take shape over the next 9 months, and I'll keep you posted via *Integral Review*.

As Dewey, Habermas, and Wilber have warned: non-synchronic patterns in socio-cultural development have resulted in a situation where our techno-scientific capabilities far outstrip our ethico-political visions and organization—21st century tools are wielded in light of 19th century (and in some cases 14th Century) ideology and government. This is a precarious situation. From where I sit—as a philosopher of education—this situation demands that we roll out the right kinds of psychological and educational technologies ASAP. We have a precious and fleeting chance to collectively build certain specific structures that will shape the future; responsibility is paramount—as is a vision of what is possible and preferable.

All the best wishes from the pre-dawn hours in Carlisle, Massachusetts.

zak

IR Editors News

Thomas Jordan

Grant for 3-year research project on The Integral Process for Complex Issues

Last December, we received the good news that a research grant application to the Swedish Knowledge Foundation for a 3-year project was approved, with a budget of about 500 thousand USD. The project title is From concerned citizens to effective societal entrepreneurs – Cognitive transformations and the role of scaffolding. Pia Andersson, now doctoral student at the Department of Work Science will carry out most of the work in the project. Dr. Thomas Jordan is the project leader, with dr. Ylva Mühlenbock and dr. Päivi Turunen as part-time co-researchers. Dr. Sara Ross, who developed TIP – The Integral Process for Complex Issues, will act as an advisor to the project. We will use TIP as the main instrument of investigation. The official description of the project is appended below.

The context of our project is societal entrepreneurs working with initiatives that involve a considerable degree of complexity and therefore difficulties in (1) understanding and managing complex processes; and (2) communicating productively with actors with different mindsets. A significant thematic concerns the challenges of working in multicultural settings.

The more research-oriented purpose of the project is to analyze the cognitive changes involved when people start to experience themselves as potentially competent societal entrepreneurs and when they develop skills in societal entrepreneurship. The more praxis-oriented purpose is to contribute to the development of methods (scaffolding modules) that facilitate skill- and confidence-building among prospective societal entrepreneurs. These general purposes are operationalized in seven specific research questions.

Our analytical framework is mainly based on adult development theory, using both qualitative and quantitative data. The main part of our project uses action research methodology, i.e. we as researchers-practitioners participate actively in co-facilitating inquiry and strategy-finding processes together with prospective societal entrepreneurs.

In the main study, we will collaborate with Hyresgästföreningen, the Swedish tenant's association. Hyresgästföreningen has recently initiated a three-year project ("Uppdrag M") focussing on the renewal of the "million programme" housing areas, the large suburbs built in the late 1960's and 1970's when Sweden went through a massive urbanization process. About a million flats were constructed in this national programme with mass production techniques, leading to areas with stereotypical high-rise

blocks. Hyresgästföreningen is keen on mobilizing and involving tenants in the renewal of these areas.
A smaller part of the project uses a best-practice approach. We will, with the assistance of the the crime prevention council in Göteborg, identify five successful examples of societal entrepreneurship and use semi-structured interviews to generate data that will be analysed for patterns of cognitive change.
The project design will generate different sets of empirical data. Participative observation, documented through journalling, will be a rich and open-ended source of qualitative data on process issues. Semi-structured interviews with process participants will be used in order to analyse whether significant transformations of the participants' constructions of various aspects of societal entrepreneurship occurred. Pre and post questionnaire assessments will generate quantifiable data on the perspectives and assumptions of the participants before and after the intervention.

The research team comprises five researchers from the disciplines of work science, public administration, social work, adult development psychology and conflict analysis. Three universities are involved: the Gothenburg, Dalarna and Antioch (USA) universities.

Tom Murray

Putting global warming aside for a moment (as if I could), I'm feeling grateful to have been born in this age of technological advancements. I ordered a DVD with the full set of audio recordings of presentations from the 2008 Integral Theory Conference, dropped it onto my iPod, and have been working my way through the whole conference in the last six months (in my car). Thanks to the prodigious efforts of the conference organizers, I can now attend multiple parallel sessions!

I have particularly enjoyed listening to the panels--lively discussions on integral approaches to subjects including Developmental Research, Environmentalism, Coaching, Education, Feminism, Politics, Psychotherapy, and Spirituality. These panel discussions are wonderful examples of the power of dialog and collectivity in knowledge building. Through the dynamic forces of interaction a quality of breadth, depth, diversity, and wisdom emerges from the whole that would hardly be possible from a single author or speaker, or from a non-interactive format. And it was hopeful to observe that the participants in these panels often exhibited characteristics of an "integral consciousness" such as: reflecting to their present internal physiological/emotional state, speaking to vulnerable elements of their psyche such as shadow, holding moments of silence with appreciation rather than awkwardness, and gracefully responding to alternative perspectives. It was not 100% so superlative, but compared to panels in other academic conferences, these were quite refreshing.

The panel on Integral Education was one of the things that inspired me to write the recently published IR article "What is the Integral in Integral Education? From Progressive Pedagogy to Integral Pedagogy," which allowed me to apply my understanding of integral theory, developed mostly over the last six years, to my decades-long work applying educational theories.

I continue to work on topics of dialog and collective processes, and enjoyed putting together a reference document "Tools for Dealing with Uncertainty, Ambiguity, and Paradox: Reflective Methods for Group Development" for a workshop I co-lead with Sara Ross and Jan Inglis at the National Conference on

Dialog and Deliberation. I'm also looking forward to participating this summer in both a New Generation Integral Activism retreat, and Next Step Integral's Integral Education Seminar, where at both venues I will be prototyping an activity to help participants gain a embodied felt sense of developmental levels as described in Spiral Dynamics and other theories.

Bonnitta Roy

I am looking forward to hosting the 2009 Integral Activism Strategic Vision Retreat at 'Alderlore' - our Connecticut farm/ home July 17th- 21st. This will allow me to develop a close and personal view of how activists are bringing forth integral ideas and putting them into practice. The retreat will be a small intergenerational gathering of people who are activists in grassroots organizing, social movement history, integral theory, whole systems thinking, nonviolent social change, anti-oppression, spiritual practices and community building. The retreat is being organized by Joshua Gorman (Generation Waking-Up) and Julia Walsh (Synthesis Rising) – two young leaders on the rise in the integral community.

Since January I have been working hard to post content on a new venture 'Integral Review of Books' to be hosted at integralreveiwofbooks.com. Designed after the kind of extended-article reviews in The New York Review of Books, I hope to build a resource for contemporary works on or operating from an integral view – over the very diverse range of what "integral" signifies. The website is currently not active, but I have been writing an extended article about scalar relations and human action at the associated blog http://integralreviewofbooks.wordpress.com .

Russ Volckmann

Integral Leadership Review and ***LeadingDigest*** now have a home. In collaboration with Keith Bellamy and Sara Nora Ross we have incorporated Integral Publishers. At present we will be publishing two new lines: books and dissertations. We seek to provide a means for the voices of integrally informed authors to be heard more widely. Our draft of our purpose statement reads:

> Integral Publishers is a 21st Century Enterprise whose fundamental purpose is to contribute to the common good. This will be achieved through the use of technology to foster dialogue and dissemination of integrally-informed ideas, concepts and experiences that enhance the development of individuals, organizations, societies and the planet as a whole.

IP is an attractor for all ideas that marry the wisdom of the past to the potential of the future. We give voice through traditional and emerging channels of communication to talent that speaks to all levels of development and to the beauty that each level brings. Our primary objective is to build an appreciation of humanity, society and world systems and to encourage them to thrive.

We will have a website soon. In the meanwhile, information on our publications can be found at http://www.integralleadershipreview.com/integral-publishers-bookstore.php. We now have six books:

- Volumes 1-3, ***Insights on Leadership***
- Robert Rabbin, ***A Mystic in Corporate America***
- Peter Merry, ***Evolutionary Leadership***
- Jordan MacLeod, ***New Currency***

Out first dissertation should be ready soon:

- Sara Nora Ross, ***Effects of a Structured Public Issues Discourse Method on the Complexity of Citizens' Reasoning and Local Political Development***

Other books and dissertations are in the pipeline.

We have unusual contracting arrangements with authors that provide considerably higher proportions of royalties to the authors than has been the custom in the publishing industry. We believe authors should be rewarded for their work.

An innovation (for us) on the ***Integral Leadership Review*** website is our streaming audio interviews with individuals like Jim Garrison, Michael Ben-Eli, Barbara Marx Hubbard and Don Beck. You can access these at http://www.integralleadershipreview.com/mp3-interviews.php.

On another note, I am serving on dissertation committees of PhD students drawing on integral theory at Antioch University, California Institute of Integral Studies, Fielding Graduate Institute, Institute for Transpersonal Psychology and Saybrook Institute. This year I am teaching about integral leadership at California Institute for Integral Studies, Saybrook Institute and Union Institute and University. Sara Nora Ross is joining me for the opening session with UI&U students in July.

Notes from the Field: A Gathering of Developmentalists

2009-10-01 12:10:33 Terri O'Fallon

Terri O’Fallon

The day was a bit misty, but despite the rain sixteen interested developmentalists from around the world rang the doorbell next to Bill Torbert’s front door on October 3rd, 2009 to engage in a dialogue on developmental theory and its measurement. This meeting was sparked by an article in the Integral Review, “Models, Metrics, and Measurement in Developmental Psychology” written by Zak Stein and Katie Heikkinen. The Abstract to their article began and ended with:

Developmental psychology is currently used to measure psychological phenomena and by some, to re-design communities. While we generally support these uses, we are concerned about quality control standards guiding the production of usable knowledge in the discipline…We reveal a conspicuous lack of psychometric rigor on the part of some of the most popular developmental approaches and invite remedies for this situation.

Highlighted in the article was the Lectical Assessment System, (Dawson et al), the Subject Object Interview (Kegan) The Leadership Development Profile (Torbert et al) Spiral Dynamics (Graves), SCTi MAP (Cook-Greuter), Requisite Organization (Jaques) and theHierarchical Complexity Scoring System (HCSS; Commons, et al.).

As a response to this critique, Bill Torbert sent an open invitation for anyone interested in exploring the article and developmentalism to a gathering in his home on October 3, 2009. A number of interested people responded but 16 were able to attend as concerned parties. Present were Aliki Nicolaides, Elizabeth Debold, Jonah Freidman, Karen Yeyinmen, Sandra M. Martinez, David McCallum, Nancy Popp, Zachary Stein, Edward Kelly, Jackie Keeley, Nancy Wallis, Mary Stacey, Katie Heikkinen, Sara Nora Ross, Bill Torbert, and

Terri O'Fallon. Present by a letter offering was Susanne Cook-Greuter. Representatives of The Lectical Assessment System, the Subject Object Interview, the Leadership Developmental Profile, HCSS, and The SCTi MAP (MAP for short) were in attendance.

Early on in the introduction process, in which each person attending described their purpose in being there, Zak Stein put forth his concern that seemed to be a basis for much of the day—that is, his concern that we catalyze an information clearing house to assure ethical use of the developmental technologies that are available for the protection of consumers in a fashion similar to the clearing by the FDA of the bio-tech industry. His assertion was that, to get a holistic picture of somebody we need multiple measures, so it was his hope that there could be more collaboration and transparency between researchers and between researchers and consumers.

Several people supported Zak's concern. In addition, other intentions were revealed: How to access the first and second person perspective in the process of working with these inventories; the shared responsibilities we have as researchers and practitioners coming together; defining our terms so that we can adequately communicate with each other and the public; the "so what" of this process; concern about what it is that we can do to bring about a big shift; how can we work together so that we can all support each other in the development of all of our work and in the process serve consciousness; and an interest in wonder. Many people came to listen and learn.

Early in the conversation we began to unravel the differences between the various measures, including what we mean by the word "cognitive" since some of these approaches were thought of as cognitive approaches. Different definitions were expressed and as the conversation ensued from this exploration we began to untangle some of the differences between the represented inventories.

For example the LAS was described as disentangling the evaluative from the descriptive before they put them back together, whereas the MAP, the LDP, and the SOI were described as more integrative of the whole from the onset. The LAS was described as measuring performances on various lines of development, whereas the SOI, MAP and LDP were described more as a measure of a whole person relative to the particular focus of their scale. It was noted that two distinct language games are involved here: one about the quality of the empirical claims and another about how you justify the evaluations you are making of each person that are about their quality as a person.

Thus, it became clear early on that the purpose behind the use of a particular developmental inventory was of importance. An observation was made that one purpose seems to be to create a generalizable and justifiable third person measure (the LAS). Others seemed to be concerned with the understanding of the insides of a person's experience (SOI). So does the (MAP) while it also looks at behaviors and cognitive complexity. A further focus was concerned with the form of development that actually comes out in action (Action Inquiry in conjunction with the LDP).

Time was set aside for those present representing the LAS, the SOI, the LDP and the MAP to further describe their approaches to measuring development. Out of this discussion, one fundamental difference seemed to surface: The LAS and HCSS are not based on the concept of a person having a center-of-gravity and the SCTi-MAP, the SOI and the LDP are. Therefore what is measured is essentially different.

A discussion ensued related to validity and reliability measures on several of the scales, large and smaller samples and other interests in the area of metrics, but this focus was held by the concern about appropriate ethics around the use of all developmental frames.

The biotech industry in the concrete world was compared with psychological technologies, which come from the world of the subtle. Because of increased demand to have people who can make decisions within the whirlwind of increased information glut, it was noted that there will be more and more demand for placing people, developmentally, in appropriate positions for making the required evaluations and assessments and decisions. Given this ballooning context it would be important to not let the market place dominate the flow of developmental services because this may be harmful to consumers.

Coming to a focus that we are all fundamentally on the same team—all looking at the same thing from different angles—we grappled with the recommendation that a community of concerned people develop standards to protect the consumer by looking at comparable institutes like ETS and AERA, and their guidelines for standards of best practices, through some form related to a clearing house or network.

It was proposed that a community of developmental academicians, researchers and practitioners come together and articulate principles for this network/clearing house and from that develop a set of standards. Setting up the right container to engender cooperation amongst us all for this effort was recognized. It would also be useful to find ways to catalyze metrics across these scales.

While this seemed to be a good first step, cautions also arose. While clearing houses could screen for ethical best practices that might include metrics, they also screen out certain options, some of which may be appropriate from later developmental levels, thus limiting choices of people, as the FDA does by not approving certain naturopathic approaches.

It was also noted that principles in and of themselves could reify our very efforts to the rigidity that we want to escape, that we might be aware of the importance of having a guiding evolutionary entity that would develop along with development itself. If we are at the frontier of human development, having developmental theory helps us see how big a challenge this is. Most people think and act in a way that distort principles into their opposites, because they don't get enough feedback.

The day began and ended with a sense of good will, a collaborative air and a promise to meet again with this rare kind of active second person research spawned by Bill Torbert's invitation. . Sara Ross, publisher of the Integral Review invited articles on the day and on the reliability and validity testing of different measures for the December issue of IR.

Our work is just beginning. While the eyes of the world are focused at this time on more prominent areas than developmentalism, we are—by comparison—under the radar. This gives us the flexibility, the freedom, the option, the responsibility to develop something ethical, and creative for ourselves. We can start from the place of shaping ourselves with the kind of developmental level and focus that humanity will one day be holding prominent, so we don't want to repeat the siloing of our clearinghouse predecessors. We want to learn from what they weren't able to see and work towards a model that is developmentally later than what we now have. This model will address how will humanity will be looking at what we did in 10, 20, or 100 years and what will we do in the design of our very models to serve humanity by imbedding development in them.

These are my own musings of that day of opening where 15 interested developmentalists made their first contact to engage with cooperation and good will.

^_______ ^

Attendees were:

Bill Torbert—A now retired Dean and professor at Boston College, Bill has authored several books, including co-authoring Action Inquiry. He co-authored a significant article in Harvard Business Review on the relationship between higher stages of development of CEOs and consultants and success in organizational transformation. He has consulted internationally and continues his consulting relationship with Harhill in the United Kingdom. He is a member opf the Integral Leadership Council for Integral Leadership Review.

Elizabeth Debold—is a senior editor at EnlightenmentNext and co-author of Mother Daughter Revolution. She holds a Harvard PhD in Human Development and Psychology. She received her doctorate in Human Development and Psychology from Harvard University, and was a founding member of the Harvard Project on Women's Psychology and Girls' Development, which was directed by Dr. Carol Gilligan.

Aliki Nicolaides—is a post doctoral Research Fellow for the Center for Institutional and Social Change She received her Ph.D. at Teachers College. Previously, she founded not- for-profit enterprises in Singapore to build the capacity of women in leadership positions in government, non-profit and civil society sectors. She continues her work with emerging civic leaders in the United States and in the Middle East, working with practitioners and scholars in a variety of contexts.

Karen Yeyinmen—is a doctoral student at Harvard Graduate School of Education where she is studying adult transformational learning and leadership development. Her research is heavily informed by constructive-developmental and socio-cultural theoretic perspectives. She was Executive Vice President at TreeTop Technologies, Inc, a Information Services company.

Jonah D. Friedman—

Sandra M. Martinez—teaches at the United States Army War College and the Naval Postgraduate School. She co-authored a paper with Bill Torbert, "Timely Co-Generation and Sharing of Knowledge." She currently lives and works outside of Tegucigalpa, Honduras.

David McCallum—is serving as assistant to the president of Le Moyne College in Syracuse, N.Y., and as visiting professor of Leadership studies in Le Moyne's Management Division. In his research, David continues to explore the implications of developmental maturation for leaders as they face the challenges of organizational change processes. In his practice, he is involved with leadership capacity building for boards of trustees, faculties, and other groups. He also provides retreats exploring the implications of adult development for spiritual maturation.

Nancy Popp— is a developmental psychologist specializing in adult development. She did her graduate work in the '80s with Robert Kegan at Harvard and has become one of the foremost experts on the Subject-Object Interview, a measure developed by Kegan and colleagues to assess the complexity of an individual's meaning-making. She continues to collaborate with Dr. Kegan on various projects.

Zachary Stein— received a B.A. in philosophy from Hampshire College in 2004 and an Ed.M. in Mind, Brain, and Education from the Harvard University Graduate School of Education in 2006. He is currently a student of philosophy and cognitive development pursing a doctorate at Harvard. He is also the Senior Analyst for the Developmental Testing Service where has worked for years employing cognitive developmental models and metrics in a variety real world contexts (www.devtestservice.com). He has published in Integral Leadership Review.

Edward Kelly—

Jackie Keeley— holds first and post-graduate degrees from the University of Bath, most recently qualifying in Action Learning methodologies with the Centre for Action Research in Professional Practice. In 1985 Jackie co-founded Harthill, building on her career as an independent consultant and her work at Roffey Park Management College. She is co-author of several papers and a contributing author to Action Inquiry: The Secret of Timely and Transforming Leadership (Berrett-Koehler, 2004).

Nancy Wallis— is Associate Dean for Curriculum and Program Delivery in the School of Human and Organizational Development at Fielding Graduate University. With a career as a scholar-practitioner, Dr. Wallis is committed to the study and practice of leadership that improves the quality of human lives, in small and large systems, in which personal and collective transformation are engaged, and where organizational goals are aligned with increasing social and economic justice. She serves on the Executive Committee of the Board of Directors of the Organizational Behavior Teaching Society (OBTS) and is a member of the Academy of Management. She presents regularly at the annual conferences associated with these organizations as well as at industry and client meetings.

Mary Stacey—Mary holds an MA in Organizational Leadership and Learning, a BA in psycholinguistics, and a diploma in counseling. She is a Newfield accredited coach and a member of the International Coaching Federation (ICF). She is a Founder and Managing Director pf Conterxt Management Consulting. Case studies of Mary's results are published in The Change Handbook: The Definitive Resource on Today's Best Methods for Engaging Whole Systems (Barrett-Koehler, 2007) and by the Information Management Forum (IMF, 2006). Her inquiry-based action learning program was designated an enterprise best practice by the CEO of Canadian Tire Corporation, Ltd. (2005).

Katie Heikkinen—is currently a doctoral candidate in the Human Development program at the Harvard Graduate School of Education, where her research focuses on the assessment of adult development, with a particular emphasis on Kurt Fischer's Skill Theory, Theo Dawson's Lectical Assessment System, and Robert Kegan's Subject-Object Interview. She is an alumni of Integral Institute and is currently on the faculty of the Integral Theory program at John F. Kennedy University. She has an article in this issue ofIntegral Leadership Review.

Terri O'Fallon—is a principal of pacific integral, her interests now lie in the living experiments of evolutionary systems design, adult levels of development and maturity, and the joys of ordinary living. She completed a PhD in integral Studies and is a certified scorer of the Leadership Development Framework. She has published in Integral Leadership Review.

Sara Ross—is a founding partner in Integral Publishers, member of the Management Review Board ofIntegral Leadership Review, founder of the community action programs for ARINA, Inc. and founder of Integral Review, Sara was also the co-editor of a special issue of World Futures with Michael Commons on hierarchical complexity. Sara teaches and does research at Antioch University. She was interviewed inIntegral Leadership Review.

^________ ^

Terri O’Fallon, PhD, is a principal of Pacific Integral, whose focus is to

1 Develop support for the relief of suffering on our planet
2. Bring together people who are willing to experiment with new effective structures for realizing transformative change in evolutionary systems
3. Develop people in ways that will bring joy and wisdom into their midst through service.

Her interests now lie in the living experiments of evolutionary systems design, adult levels of development and maturity, and the joys of ordinary living.

Transcript: Closing Conversation of the “Validity Day” Meeting at Bill Torbert’s, October 3, 2009

Introduction

After *Integral Review’s* (IR) publication of Stein and Heikkinen’s *Metrics, Models, and Measurement in Developmental Psychology* in June 2009, Bill Torbert submitted a spirited response to the article, which IR published in its July 2009 *Occasional Newsletter* (linked in this Special Section’s Table of Contents for reference). In that response, Bill included an invitation to all interested parties to convene at his home in the autumn to learn about and discuss the validity testing to which the Harthill Leadership Developmental Profile had been subjected over the years.

On October 3, 2009, 14 individuals joined Bill at his home at 138 Parker St, Newton, MA for the day-long meeting. Ten participants hailed from across the US, one individual flew in from Honduras, one from Canada, and two others arrived from Ireland and the UK. The meeting participants are listed below.

This document is the result of Bill’s suggestion near the end of the audio-recorded meeting that a transcript of the closing conversation be prepared and published in IR. With unanimous agreement of those present, that conversation is shared as a further contribution to the dialogue catalyzed by Stein and Heikkinen’s article.

The original meeting agenda, proposed by Bill to participants who confirmed attendance, is included below as a way to orient readers to the general tenor and content of the day’s discussions. From it flowed the transcripted closing conversation that follows below the list of participants.

“Validity Day” Meeting Agenda

11:00 – 11:10	Short meditation to bring us more fully into ourselves and one another’s company
11:10 – 12:00	3-minute introductions of ourselves and our current work/question
12:00 – 1:00	What is each of the three measures seeking to know about and predict (i.e., the Leadership Development Profile, the Subject-Object Interview, and Lectical Assessment)?
1:00 – 1:30	Lunch
1:30 – 3:30	What kinds of reliability and validity tests have been performed on and with each measure? (40 min. each)
3:30 – 3:45	Break
3:45 – 5:00	What kind of relationship between social inquiry and social action does the measure demonstrate?

SOME RIGHTS RESERVED

Meeting Participants

The following were participants in this meeting, all of whom agreed to the use of audio recording and transcription. Speakers included below have reviewed and approved this transcript.

Elizabeth Debold, *EnlightenNext* Magazine
Jonah Freidman, Fordham University
Katie Heikkinen, Harvard School of Education
Jackie Keeley, Harthill Consulting Ltd., UK
Edward Kelly, of France and Ireland
Sandra M. Martinez, Cebrowski Institute, Naval Postgraduate School, Honduras
David McCallum, S.J., LeMoyne College
Aliki Nicolaides, Columbia University
Terri O’Fallon, Pacific Integral
Nancy Popp, Antioch University McGregor
Sara Nora Ross, *Integral Review* Journal
Mary Stacey, Managing Director, Context Management Consulting Inc.
Zachary Stein, Harvard School of Education; Developmental Testing Service, Inc.
Bill Torbert, Emeritus Professor, Boston College
Nancy Wallis, Fielding Graduate Institute
Karen Yeyinmen, Harvard School of Education

Transcript

Bill: [Referring to original agenda for this last hour of the day’s conversation] I’m not sure it’s quite the right question, but I think one of the questions that has been coming up is this question of how to influence things more widely in terms of larger systems and so forth, so that may be closer to our question at this point.

On the back of the page with Susanne’s comment, I have an outline of my developmental model of social science, showing the underlying developmental action-logics of different ways of doing social science. Empirical positivism is an approach to social science that treats only objective, third-person knowledge as potentially valid. I have been aspiring towards a kind of social science I call Developmental Action Inquiry that attempts to interweave first-, second-, and third-person research. It’s something that social science has not bothered to do yet and I think ought to. So, in a way, it’s my answer to the question of—why am I so concerned about this action stuff? Well, because we all are, I think, and because the question that it seems to me we all ask ourselves—although very few of us ask it explicitly is: What action would be timely now? That seems to me to be the one question that is relevant all the time and yet, it’s a question that social science, as we now know it, can’t speak to at all, because it doesn’t integrate first-, second-, and third-person research. Most third-person research attempts to be time-neutral and, therefore, has nothing to say to the question.

This was all in the service of talking about the larger paradigm out of which I thought my work was coming, but I don't think that's exactly the topic we want to discuss right now. What do you say? Let's try something harder—like finding the question we want to discuss.

Sandra: Drawing on what you've said, I've had several conversations with people about how we—it was Sara, and Jackie, you mentioned this too…about how we might want to talk about what we share in terms of the transformation we're trying to enact or support at a higher level, at an institutional level. Perhaps we could discuss how we can support one another and how we might weave this discussion into the type of conversation we want to have about validity.

Bill: Right, and that relates to the sort of clearinghouse/network question, maybe.

Jonah: I suppose the question that comes up for me is hearing because three of you worked in, in some sense, this intervention or ambush or hearing, or wanting to hear, or are really, really curious about what we can hear together because I was very curious to hear from you also what you may have heard in your time here, perhaps what you might not have thought you were coming to hear.

Bill: Which three are you thinking of? Sort of the complexity people?

[Laughter]

Bill: I think you will have identified them as a unit.[referring to Zak, Katie, and Sara, because they share a common theoretical foundation of Hierarchical Complexity theory]

Jonah: Probably, you helped to invite us to be itself a possibility by writing the article, which was an invitation. So, in a sense, you walked into it and we walked into it by virtue of your intention, too. I'd be curious and certainly am curious.

Sara: One question that was floating in me right before you started to speak was, "What does the field of practice need from the theory side?" That's a question I'm sitting with and that's certainly related to my earlier motivation last year to suggest we need some kind of Institute of Applied Developmental Theory. But I'm just wondering in the light of the conversations today, from the praxis standpoint—is anything arising? What does the field of practice need from theory?

Elizabeth: Do you mean theory or do you mean metrics?

Sara: No, I mean from developmental theory. Yes, seeing metrics as the instrumentation of theory, but that wasn't where I was going. I guess one reason I'm asking that is related to something I said earlier about the need I see, at least, but maybe it's not something that's really a need, of distinguishing among—if we're going to choose metrics, if we're going to choose instruments, if we're going to choose intervention measures and methods and other process methods, what do we need practically to help us distinguish doing what?

Do we want to organize our thinking around someone’s center of gravity or someone’s performance or someone’s behaviors typically in a certain domain? What kind of constructs, maybe, is what I’m asking, does the field of practice need from the theory side to help make things more useful?

David: To join you with that, it feels like we need to co-generate some new principles for both the research and the application. I was thinking about it in terms of, in many professions, there are codes of conduct and practice that are really thoughtful, reflective. People come up with them consensually and they‘re ways of establishing these guidelines for how we use technologies and techniques. That would be an interesting conversation to begin to sort of roll out, and it is happening. The idea of the Integral Metrological Pluralism, Bob Kegan’s thinking, talking about it’s not people here in terms of what we’re trying to assess, but something more intangible, Susanne’s, I think, concerns are the concerns about seeing people in a variety of contexts. There are a number of things already on the table that help us to shape our thinking around how this material should be used responsibly. I have energy around that, too, and I don’t know if you feel the same way.

Jonah: I guess I’m curious to go back to you guys, in that. In a sense, you are going to go back and take away from here something. You came to here with something, we love it and we hopefully brought something to the table, to the floor or circle also, but in a sense, you’re going back also with a variety of tasks that you’ve set in place. I guess I’m hoping perhaps or asking if you could share a part of that, as it were, to pre-reflect or to engage us with it, if it’s possible.

Zak: I guess I’m not feeling that kind of us-them kind of thing.

Jonah: I don’t mean to cast it in that way, but it’s probably set up by what I call our being here by response.

Zak: Yes. Coming here was funny because it was like you’re [Bill] inviting me over because you are going to yell at me about this. [Laughter] He’s gonna color me counter dependent-antagonistic, yeah, I had issues with my father but you don’t look like him very much. [laughter]

Bill: I’m glad we got that straight.

Zak: To be here, we’re all really so fundamentally on the same team here and that’s the thing. I guess for me, what I’m taking away is what can we really do? Is it a matter of like a special section of *Integral Review* where we tried our best to get, for example, Bob and we’ll get Theo. We’ll try to get everyone in there to make a unified statement, of course, with different perspectives, with different details about the fact that, “Listen, all the experts in this field are concerned about the way we’re rolling these things out. Let’s be more concerned.” That would be the first step.

I’m looking more for action steps after this. What should we really do here? What would be the best place to put our energies to have positive outward ramifications? But at the same time, I think I’m realistic about what could be done. I don’t think that we can affect the everyday language that people use in the communities that surround these things in the immediate near future. I think that is going to be a longer term project where we as—for the lack of a term—professionals model more sophisticated ways of talking about this. That is what I’m coming away with. There’s a sense that yes, we’re all trying to do the right thing here and we’re all really, I think, even theoretically from a psychometric perspective, I think we’re all really looking at the same thing from different angles. That’s part of my dissertation work is to show that. It’s to show that there is this thing out there that’s like weight. We’ve been going at it from all these different angles, and you know, for some purposes, a scale is fine; for other purposes, you need literally down to the microgram. So, yes, I guess I’m just feeling a sense of unity, but also just concern of all of, okay, now, what are we going to do? What more should we do? Along these lines of what would be if we decide, “All right, let’s do this, not a clearinghouse but more like a group of concerned people coming together to articulate standards of practice.” What would they really be? I don’t think it’s going to be, “Everything needs to be [reliability of] 0.96.” I don’t think it’s going to be lines like that. If you look at comparable institutions like the American Psychological Association and Educational Research—I forgot the acronym—anyway, they’ve got this nice…

Sara: A-E-R-A.

Zak: Yes, AERA. They’ve got this nice little booklet. I cited it in the paper. They’re just standards for educational measurements and they don’t drop any numbers or any statistics, but they give all of these guidelines for best practices and about different kinds of validity and how to make those things and they’re talking about regular old educational assessment things, not developmental assessments. And so I think that there’s maybe some need for something like that.

Sara: Yes, and the different categories we find ourselves, the assessment domain and your interests there are not like my interests. Mine are different. But still, we have different kinds of assessment interests and it’s not one thing we’re talking about and we have different kinds of consultation and coaching, other kinds of organizational research. I mean, there’s a whole bunch of different categories here because developmental stuff crosscuts. There isn‘t anything that doesn’t fit under something we might want to pay attention to, it’s crosscutting. So I think it could end up being kind of a good idea of standards, principles, attractive to me as a starting place, if nothing else to raise attention that we need to be paying attention to such things. And practitioners need to be supported, not everybody will ever be a specialist in this. We could never expect it, so what kind of support do we offer those who aren’t going to specialize, but really can use this to benefit others?

Woman: Is there a best practices in terms of using assessments in different contexts that would…

Sara: That’s what I think we need to create. That’s my sense if something comes up and I’m sure we could draw from things like the APA and therapeutics…

Zak: That's what that got me. I mean it says—for using tests and organizational environments, for using tests for high stake decisions, for using tests for this. They specify different contexts and they talk about proper and improper usage, and it is. It was a committee of many, many people. It's interesting book. It's worth looking at. In a way, we could fold into that.

I was also thinking of other things. So there's that, but I was also thinking we need to find ways to catalyze research and cross metric comparison research, cross-model research, because these things are evolving. Ten years from now, if we're having exactly the same conversation, then we failed. We need to be talking about these new metrics and improvements that come from the cross fertilization and the multiple perspectives. So that's another thing that we were thinking about and that's the idea of the clearinghouse, I see now, I always thought of it as also a collaboration space, a space so we all know what one another is doing with the research and then it would be easier to see if we have relevant data sets that overlap or something like that. Not so much to bring unity to the field, but to make it a field where everyone knows what everyone else is doing.

Sara: A community of inquiry?

Zak: Yes.

[laugher]

Bill: My goodness...

Sandra: I'm just thinking about what you said. If we share enough, we could articulate a certain set of principles and then eventually cascade down from these principles to develop standards of practice. We can refine and modify these principles. However, at this stage, the objective would be to develop a common language. I like the idea of starting with principles because they are at a higher level of abstraction. Perhaps we, as a group, could articulate a set of principles that we could all commit to and that is sufficiently general to cover all our areas of interest. I'm drawing from what you said. After developing the principles, we could then begin to develop standards or behavior.

Sara: Yes, and we might want to move them up and down because sometimes what we call "principles" aren't technically principles at all, but we might really want them to be high level principles, so we could really do a lot of action inquiry around that.

Terri: And understanding that anything we have as a principle could easily be reified into something very concrete and not evolving, then they could be applied to support very concrete processes and behaviors and then as a result not evolve. This is one of the concerns I have.

Sara: I agree. And I think we can be really careful about how we define them, and how we look at what *is* a principle because sometimes what people call principles really aren't.

Instead, they're very reifiable things that really aren't in the principle category. So, I think we could bring some elegance to it that way, and avoid what you're worried about.

Zak: Hopefully, if we define it, whatever it becomes, so it's a living document. It's a living agreement. But that's easier to say than actually pull off.

Bill: Yes. Donald Campbell's law of invalidity—the more people start paying attention to it, the more it will get distorted. So, it requires an institution that is capable of double-loop and triple-loop change and who's going to start that one?

[Laughter]

Elizabeth: What would you propose as an alternative? If we're looking at an action to take to move forward, what would be…?

Bill: I'm just trying to hide. I'm not trying to say it's not a good idea, but in a sense, joining Terri in her concern and I'm trying to emphasize that, in a sense, that was Dostoevsky's thing about the Inquisition, you know, in the name of Jesus, the Inquisition re-crucifies Jesus at his second coming. You know, our institutions tend to turn into the opposite of what they were meant to be. I thought banks were supposed to keep us financially safe—oh, haven't they been doing that recently?

Elizabeth: I share the same concern.

Bill: Yes, but we're at the frontier of human development, generally, in trying to do this, so having a developmental theory helps us, perhaps, recognize just how big the challenge is because most people think and act in ways that are likely to distort principles into their opposites, because they won't receive enough feedback to adjust.

Edward: Perhaps then, just given that everybody, lots of you have highlighted how language trips everybody into—I mean, so when I hear "applied" I trip off into something, when I hear "principles" I trip off into something. And yet, I support the collective need for understanding of what each of us are doing. I just think it's been wonderful to get the sharing of different perspectives today. It advances things hugely in such a short time because perhaps we're putting similarities and differences out there and we have to realize lots of stuff. Going forward then, maybe, we just have to try and find some other words to …

Sara: How would you say what you would want? How would you like…

Edward: I would start with almost the same format again on a bi-annual, quarterly kind of get-together. It wouldn't be exclusive to this particular group of people or particular models, metrics, theoretical approaches that were put up. Presumably it's something that comes under the umbrella of developmental theory, practice, metrics, whatever. Most of my knowledge is in the LDP. I'd like to spend more time on the subject-object and I'd like to spend more time on the LAS… I'd like to get this sort of inside hermeneutical perspective that you have [looking at Zak], so that I’m not reducing what I hear from you to what I already know from my side.

Sandra: How do we do that?

Edward: I’d like to try that. I don’t know how we do that. I’d like to become Zak for a day so I can see what you’re saying because and likewise, to get inside…

Bill: Is there a movie about that man?

Edward: Say you push me to something. So, that’s sort of what I thinking.

Zak: I like this idea of a bi-annual thing maybe, and maybe under this Institute of Applied Developmental Psychology, but there are some folks that are not in this room who should be in the room. The Spiral Dynamics team, the Elliot Jaques’ group…

Bill: Yes, and Bob [Kegan] and Lisa [Lahey].

Zak: Yes, individuals but also whole groups that aren’t represented.

Aliki: I’m wondering. There are a couple of research possibilities, studies that have been initiated, like for instance, the one that JFK, the one that potentially you might win. I got to wondering if there is now an opportunity to create some permeability or a study to include some of these other alternative modalities and why not engage them and decide actions to join this kind of project. I don’t know if there’s space within the research initiatives that you’re all involved in or maybe one that can be sponsored through one of the universities that are being represented in the room here, but that might be something to take our action more quickly into action. There are some opportunities here, here in the LDP as an additional inventory that gets used or bring in the SCTI MAP as an additional inventory. Why not, if you can?

Sandra: Yes.

Elizabeth: We’re hoping to be able to start to look at data together between the people who have created the metrics and be able to say, “Okay. Look at how these things are varying or how they’re working together,” and begin to really start to have a conversation about this together. We were hoping to get funding for that next year to really start an inquiry and do it. *EnlightenNext* is going to be putting on conferences annually and that would be part of the conference agenda for that year.

When we initiated the idea, we had such a strong response from all around the world—people in Australia, saying, “I need to know. We need to know. We need to do something about this. We need to be clear about what we’re talking about together and how this thing’s working.” That’s one thing—that there’s a forum that’s going to come into existence to understand the relationship between these metrics and the theoretical assumptions that they are based on. There's also the JFK Integral Theory Conference that will be meeting every other year; this could be a module in that conference.

Zak: I know they're planning panels on a lot of the issues that we talked about it today. The issue of funding, I think, is key because as much as I'd love to pursue these things…

Elizabeth: I know. I know.

Zak: It's like time and money are really bottlenecks and I tell them one thing we can think about is somehow pursuing some kind of funding source for research.

Elizabeth: I also like the idea of doing a special issue of the *Integral Review*.

Bill: I guess it's being done, right? For January, I mean, that's why…

Sara: Yes, the next issue—the regular issue will be in December, and presumably, everybody on the list like Bob Kegan (don't know if he responded directly), Michael Commons, Susanne, whoever wants to respond directly, to have the more formal or informal whatever kind of piece, whether peer reviewed or editorially reviewed format to respond to Zak's and your [Bill's] response, which we put in the newsletter. There's not going to be a special issue dedicated to that because of course we don't know how many will actually produce. Of course, anyone from here is more than welcome to contribute anything from just a reflective essay on what was today like, to something more elaborate or any other kind of—join the discourse about the whole subject from your perspective.

Bill: Yes. Tom Murray emailed me about this, this week, said he'd like to have a tape and so, I think he somehow wants to use this…so I guess I'm assuming, but I shouldn't assume that we could share this with him.

Sara: Is that okay with you guys?

Murmurs: Sure.

Bill: That's where the request originally came from actually. I think that is a good opportunity when a number of us see ourselves. I mean look at what it does when somebody puts something in print that gets you all over-excited.

Sandra: I think it's quite amazing that we all gathered here from different continents. It's really a privilege to talk to everyone here. I hope we can continue it.

Bill: Absolutely.

Aliki: I do want to second the idea, or maybe it's the third or fifth "second" of the idea by now, the idea that maybe, there is a way that we can create some sort of an inquiry conversation that happens again in this configuration and others where we then focus the next conversation on principles, let's say. We're going to use the day to come up with some of these notions and then, in between some of these publications, the IR [*Integral Review*], this keeping each other abreast of each other's research or ways to stay in relationship and in between the convening. I like that idea. I have a lot of energy around that.

Zak: I like it too, I mean, what was unique about this was that it was such a dialogue and there was so much reciprocity and I feel like it's hard to get that in academic discourse situations.

[laughter]

Sara: Even in just a discussion forum on the internet.

Zak: Exactly. So we'd have to create the right container. The fact that this was so personal, and I think, it really helps—and kudos for setting it up and Bill, you opening your home to us…

Bill: Good sandwiches…

Zak: Yes, yes. I wanted it to happen, but what I don't want to happen is that it turns into a conference situation where people are taking sides and it's just like, "All right. We didn't do anything." I feel like here, we're doing something and I don't know how to make that happen if it gets bigger I guess.

Elizabeth: Well, it seems like we are saying, "Let's make a commitment to the process of trying to understand each other in the theories and humanity, people in general." It is the process that we're committed to, the evolution of development and all that.

Woman: I don't want to advocate for formalizing this. I was just more interested in maybe bringing another friend who happens to represent another view to sit next to one of us and have that add to the conversation as opposed to having maybe, Michael Commons come and Bob Kegan, and I don't know, whoever else there is.

David: Although if they could—wonderful, because I think that there's a kind of weight about having the sort of spokespeople of these different lineages of development. That does have a certain cache in a larger field. We've got a lot of Experts and Achievers who are picking up these paradigms and using them in pretty instrumental ways. It makes a difference when you have certain names on the flag-staff. But wouldn't it be good to have a weekend where we can have a "Flex Flow" structure for the weekends and good food, nice drink, good clean water, and spend some time basically having this kind of conversation. That would be very nice.

Mary: I'd like to go back to that practitioner question that you asked. I think, from a practitioner's perspective, I would ask that you keep the spirit of dialogue alive when you're going to your writing and your publishing, because we depend so much on it to stay current. We have so much translation and bridging work to do and need to depend on you to have had various conversations. When I read [the article]—I guess it was June, I was distressed. In the LDP I'd found something I could take into business and the language was close enough. I had this huge "Oh, shit" moment that I think has been addressed in being able to sit in on this conversation. My request is that you keep the spirit of dialogue alive when you're going into those other ways of communicating.

Elizabeth: May I ask? Are you asking for the language to be more accessible or are you just asking for there to be a more conversational way of engaging with these questions…

Mary: I'm making the distinction between myself as a practitioner and some of you as academics, I'm asking you to create dialogue in other contexts as you're writing, as you're publishing in journals and what-not. I'm back to my first, "What's the responsibility we uphold to be in dialogue, be in a conversation before we 'go out'" because it's just so important for us as practitioners to be able to trust, to be very literate, and to be willing to do the translation work that we do.

Sara: It's a huge burden, that practitioners share—because some of us are both—to be so multilingual across theories. I mean, it's a lot.

Mary: Let's help each other avoid the "Oh, shit" moment.

Sara: What were you referring to? What was the "oh, shit" moment?

Mary: It was reading the journal article in June [Stein & Heikkinen] and realizing that this measure that I've invested in, had taken into my company and out my clients, was being questioned in such a clear way and I couldn't really read into it what that meant.

Bill: "I'm using the LDP and they decided it has no validity."

Mary: It's just more about this spirit that's living here today and I think it's probably expanded and I just wanted to highlight it.

Edward: Has that only happened to you once in the last year?

[laughter]

Mary: If we can spare each other those moments, then let's do it.

Jackie: What that makes me think about is how not to rarify the conversation and to somehow find ways to bring in the voices of the people with whom we're actually working with these measures and the different ways there might be of bringing it to them. How can we get their experiences back into the process so that we know that what we're doing is making sense to them and giving them some value in their lives? I don't know how will you do that, but it seems to me that would add another level, another important voice, another person into the research. So that, I think, is speaking more toward what you're saying, Mary — in a way, what could we do to contribute to the ongoing conversation, but do it from a practitioner’s point of view?

Sara: That gives me an idea for a book. [Laughter] Seriously. A practitioner book everyone could contribute to with their…

Woman: Right, and the stories are neat. My client is resisting doing what we would all say is suggested.

Jackie: Of course. When you think about doing it in Russia, you’ve got all of that complexity we were talking about in the beginning and what impact does that have on the situation?

Sandra: I think we’ve been terribly collaborative. I didn’t know what to expect of this dialogue today, but it could have turned out differently and I think that it is reflective of who we are personally and how we work. I’m hearing that you want it to be open and inclusive and collaborative. Maybe I'm reading this into it, but this is how I'm interpreting what I am hearing.

Terri: I’m appreciating the quality of the conversation, the dialogue and the intention behind it all today. It feels very alive to me and I’m encouraging that as everybody goes off in disparate ways and to their own work. This kind of spirit can be infused there, too.

Nancy P: Instead of going back to our own camps and just writing about…[Crosstalk]

Terri: If I were with that corporate client, we’d be talking about silos and cross-fertilization. What clients (and we) can learn is, “I can pick up the phone and talk to this guy first before we make our critiques public.” Just keep the spirit we have here moving into the practitioner’s circles.

Zak: I started us all off making this comparison to biotech and I made this argument that I think psychological technologies is a growth industry. I think we may be underestimating the demand that is going to be arising in the next decade or so, surrounding organizational change and the assessment of human capabilities, I mean, there’s a long literature on it, take Daniel Bell's *The Coming of Post-Industrial Society*, where he basically prophesizes that in the near future it's not going to be the ins and outs of industrial technology we are going to worry about, it’s going to be the motivational and capability systems of employees that are going to start to be the main problem in information societies, post-industrial societies and I think that’s where we’re about to be. Look at Google. That’s a five-year shabam and all of a sudden it's too much information for everybody. We’re just in decision-making crisis after decision-making crisis. And at some point, people are going to start to realize that, “Oh, yeah, there are these developmental psychologists who've been worrying about this already for two decades.” The reason I like the fact that we’re having this conversation is that we can’t let the market mechanisms hold sway here.

We need to keep an eye on the ethical prizes, which are to evolve consciousness and cultivate the broadest, deepest humanity we can. In the beginning of the biotech thing, they would never have the thought that you'd be getting a bunch of these companies together, because they'd be sharing trade secrets with one another. We're in the opposite position. Where we want to learn from one another, so that we can reciprocally make one another stronger. I think if we can keep that, then there's a potential for this to do a lot more good than it would otherwise do if we factionated, and compete as opposed to collaborate.

Sara: And I think what evolutionary potential is, is that if there's anything ailing us in general, societally, globally, is how fractured, how compartmentalized we are… If this field finally gets out there a unified understanding of the organism as a whole. I mean, a fractured field does no good in that respect. But we're positioned well with all these different windows and time horizons—we're really well-positioned to disseminate and operationalize much more holistic understandings of whole human beings, so I think that we have a lot of important work to do there, too.

Zak: It's critical. We need to show—and this is my 1984 hat that I'll wear now—we need to show that people can transform without invasive biomedical interventions. Because that is where we're going. All the work that I do in the field of Mind, Brain and Education, is primarily about that. I'm saying, "Stop. Don't just give the kid a Ritalin, worry about the institutional norms that are interfacing with this biology, not just this biology."

We need to have ways of showing that people can transform because it's clear people are needing to transform. We face epidemics of psychological disorders, of depression and "hyper-activity" and these kinds of things. And the way our cultural mores are, we say, "Just give me the med." And it's going to be different now. And that trend will increase. There are these intracranial stimulations. I mean they're going to do that. So I feel a sense of urgency. But I can only make so many arguments to these folks about… "This is unethical." Right. Then they say, "Well, what else are you going to do, buddy?" I went to a meeting of the Neural Information Processing Systems Society, and it was frightening. These were the most rampant reductionistic guys. And they are getting endless funding. There's an urgency here to show that we can do this as psychologists; we can do this by changing people, their action patterns and the way they speak and all of these things.

Karen: I think your question about funding is really important, too, because my husband's in biotech. He was working for a biotech start-up for a while that was working on early stage drug development. They weren't worried about bringing the drug to market. They wanted to come up with early-stage compounds that could go into the pipeline to be ultimately developed. They had trouble coming up with their second round of funding because whenever they went to the investment community, the investors would say, "This is exactly what we need because the industry is drying up." We have these certain compounds and they've been used and used and used to death. Everyone's trying to take those same things and bring them to market differently because that's where the money is. People—it's like low-risk, high pay-off, whatnot and this is really high risk; but it's what's needed by the industry but there's no funding to support that even though that's what's needed. There seems to me it's interesting that you pick the biotech industry as a comparison because I wonder what else can we learn from what's going on there about what we don't want to do and this connection between where the funds are going being different from what's needed. How do you shift that? Where is the value proposition to the funders?

Zak: And it's comparable at multiple levels because there's one foot in the academy, one foot in industry-type of thing where high level knowledge and work with big-time effects on society. It's true. Biotech is at a plateau, more or less. We crack the genome when we thought we could find all its secrets. The truth is that we don't know. I think that this next thing is going to be just like biological technologies and we need to get a handle the quality control there. The FDA is a terrible example, setting standards. I think that we need to worry about quality control and to learn lessons from biotech.

Nancy P: I think we also need your point about giving a kid Ritalin is reminding me that, I think, a lot of fragmentation is that we're taking people and parts of people out of context. We're separating the kid from the environment and saying, "Okay, this is the behavior. Let's fix the behavior when they're not looking." One of the big problems with medical doctors is you go in, they're treating you like a bundle of symptoms rather than a whole person, so it's picking things apart and forgetting the context of the whole person within their environment. To me, that seems like a really crucial thing to keep bringing this back to this—what's the context?

Elizabeth: That's the structure of mind and consciousness at a developmental level. It's a really interesting thing because the ethical and moral demand of our time and of our profession is something that is way ahead of the normative curve where the culture is and where these decisions are being made. I appreciate your bringing in the transhumanist dimension of how development is going to happen because we've got all these achievers, if you will—there are so many different terms for that level—who are saying that we need to evolve, that human beings need to evolve and the best and fastest way to do it is through this medical and technological drug intervention. We need to actually broaden our horizons to see this as part of the developmental world even though it is not what we're about at all. But that is actually the marketplace, if you will, that we're competing in.

David: It's the modal developmental level at which this stuff is being instrumentalized.

Elizabeth: Exactly, and being understood. That's a very interesting thing for us as practitioners and researchers. Where are the places for intervention? What is it that we need to demonstrate? How do we move this forward to the culture in a way that is going to have an effect so that enough leadership decision-making is happening at a different order of thought rather than this? There's a heck of a lot of money to be made in it and that's the modal developmental level.

Zak: The psychometrics are integrated. The statistical diagnostic manual, I mean, the DSM. That's the IQ psychometrics and the whole rhythm of things is tied to this testing industry. There are so many places to push to make things shift, and so...

Sandra: I hope you articulate your arguments in this article because I think…

Bill: I was thinking actually, a little edited version of this conversation could be in the [*Integral Review*] journal because it catches the liveliness and some really important, powerful things have been said here in the last five minutes.

Sandra: The specific arguments that you have recently made, Zak, are critical. I believe it is important to articulate your arguments well and, in your comparison of growth in the biotech and the burgeoning developmental assessment industry, to illustrate how solutions for developmental issues are being sought in certain technologies divorced from a concern and appreciation for human development. Secondly, to a certain degree you need financial clout and backing to gain legitimacy. If part of acquiring legitimacy is getting financial support from a large agency for a large-scale study, maybe we could individually think about what that study could be and who would support it.

Terri: Also, thinking years down the road, when we are in this place where we're no longer in the biological money-making business of biotech, but we're in the psychological money-making business—so, psychological tech—are we going to become siloed again and have the same mindset towards our money-making as the biotech does now? Are we going to actually remain in a community where we're not looking at ourselves; how we can be political about psychology? So… this is something I feel so concerned about. I'm really here with the heart of knowing that everybody has pieces of humanity's puzzle and no one has all of them. If we can work together in a proper way, everybody will flourish, but coming out of the silos to re-silo again is not going to be the answer here. I'm personally going to make a commitment not to fall back into that again, which could easily happen. That's something to think about.

Jackie: This is a very specific challenge and this is about silos because being published in the *Integral Review* and all of the places that we all know and love to read is one thing, but that's actually, a really tiny little bit of who's paying any attention. We're paying attention to what we're paying attention to know. We don't know who else is out there.

Bill: We are the readership!

[laughter]

Jackie: Yes. So I can try to think about this for UK, for instance, but then, I don't know where I'd look to get something published. Where else could you get published in the US that would widen the audience? It seems to me like a really important question and turn to thinking about going down to this root.

Zak: I can tell you that I edit a special section of the Journal for *Mind, Brain and Education* which is an award winning journal. It’s got a wide dissemination and it’s funded by Blackwell. It’s a major mainstream academic journal. I would welcome any submissions about any of this kind of stuff—this research-practice thing, the multiple models of development thing and again, the educational aspects would be relevant for that journal. I like the idea of pushing into the mainstream academic journals with this stuff, but the truth is many important readers are not from mainstream academics.

Woman: Yes, exactly.

Zak: My articles that are published in *Integral Review*, I think, more people read those than the ones that I publish in *New Ideas in Psychology*, or *Journal of Philosophy of Education*, or things like that. I mean the academy is fragmented and siloed. There are so many people publishing so much crap and the question of where to say something, where it matters that you said it, I think, is a core question. I really don’t know.

David: Part of leadership is getting people to pay attention to the right things, so how do you catch the attention of the right folks? Oprah has a very skillful way of doing this, doesn’t she?

[laughter]

Karen: It is a classic adaptive challenge. How do we get this set of stakeholders? Who are the set of stakeholders? What is the work? What is it that we’re trying to do? I think we’ve captured some of that here, but in the Heifetz model you start by defining the work. What is it that we do agree we’re trying to do? I think there’s been some of it out there today. Then, who has a perspective on that thing? What are those perspectives and what do they have to lose if we were to achieve that thing? So then, let’s start maybe there…

Elizabeth: What’s interesting is that when you shift the focus away from “Here we are together with competing measures” or “Here we are together trying to come to an understanding of how we assess and what we mean by development” to the larger questions. It gives us even more ground for unity. We’re all together in not wanting a certain future to arise. We all want, as Terri said, to serve consciousness and are very concerned whether consciousness development can happen in a context that is materialistic and that we perceive as dangerous to the larger whole that we’re all a part. It’s an interesting re-frame that enables you see the problem in a different way. And therefore, our unity becomes more rich and tangible. But then, what is the action step that will make that mean something?

Bill: I was really somehow particularly struck when you said, Zak, about ten minutes ago, you know, I’ve tried to do this all my life, but I just heard it for the first time. We’re trying to make transformation a real possibility for people and that is so different from incremental change. It’s driven by a completely different form of power—for me, at least. It does indeed have to be mutual; and that, in turn, prioritizes the second-person present form of research, which is the form we’ve been conducting today. Instead of somebody coming in and telling everybody else what's going on, we're here trying to keep the questions in the center.

It just comes back to what you were saying, Mary. That explains why it's so important to keep this spirit going because it's really the only spirit that supports transformation. None of us could have forced any of the rest of us to care about our stuff, and we didn't go about it that way, so it worked today. But that's not the way academic discourse usually moves. I'm just putting together why it is so important to keep this element of it. That's of course part of what needs to be highlighted: the centrality of an active community of inquiry. It seems obvious because that phrase comes from academics, though it never applies it to itself in the real way [laughter] but it's what's true in a corporation too, right now. For them to survive and transform, they need to have an active community of inquiry. These boards of directors that rubberstamp things is what got us into the last two years. So, in a way, this is a question which is not only true for us as developmentalists—although maybe, it's hyper, hyper-true for us, really, *we* ought to be the ones who got it—but it's also what is a societally-needed form of activity. Part of our action is actually in doing this but then, how does it get, as you were saying, how do we get other people to see that?

I'm just being helped to get myself to rewrite this old book of mine, *The Power of Balance*. And the new title is *When Will We Discover our Mutually Transforming Powers?* It is meant to speak to a lot of different kinds of people, so, maybe, that can play a role, too. Certainly, everything I've heard today is getting siphoned into my thinking about how to revise the book and make it more accessible.

Terri: One of the things I appreciate, in a way, is that typically the whole world has their eyes riveted on certain popular places and tantalizing ideas and then there's the common sidewalk with the obscure dandelion tentatively growing, spreading its little seeds everywhere, being under the radar kind of like we may be here—since we aren't in the spotlight it does give us some flexibility that others wouldn't have because we don't have the whole world looking at us….we can start from a more principled position where certain political interests may not kick us and push us and shove us and shape us. We can really shape ourselves with the kind of ethics, the kind of process, and the kinds of developmental level that eventually humanity *will* be looking at. So, we have a responsibility right now, being in this space of planning for the illuminated future for developmentalism. It's a place where in the future, the whole of humanity will be looking at *that* and some other flower will be poking out of the sidewalk. What are they going to be looking at 10 years, 20 years, 50 years, 100 years down the road? What are we doing here today that they will be looking at then? That's my question.

Bill: Mmm, I'm sure glad we have every single voice here today as I listen to your voice. Thanks, folks. Let's stop, and then let's go. Thank you very much.

[general appreciative applause on part of all for all…]

Working Within the Limits: Thoughts on Stein and Heikkinen

Theo Dawson

As a woman on an assessment mission, I echo many of the concerns raised by Stein and Heikkinen. It is important for those of us who use assessments to ensure that they (1) measure what we say they measure, (2) measure it reliably enough to justify claimed distinctions between persons, and (3) are used responsibly. It is relatively easy for testing experts to create assessments that are adequately reliable for individual assessment, and although it is more difficult to show that these tests measure the construct of interest, there are reasonable methods for showing that an assessment meets this standard. However, it is more difficult to ensure that assessments are used responsibly.

Few consumers of tests are aware of their inherent limitations. Even the best tests, those that are highly reliable and measure what they are supposed to measure, provide only a limited amount of information. This is true of all measures. The more we hone in on a measureable dimension—the greater our precision becomes—the narrower the construct becomes. Time, weight, height, and distance are all extremely narrow constructs. This means that they provide a very specific piece of information extremely well. When we use a ruler, we can have great confidence in the measurement we make, down to very small lengths (depending on the ruler, of course). No one doubts the great advantages of this kind of precision. But we can't learn anything else about the measured object. Our measurement cannot tell us what the object is, how it is shaped, its color, its use, its weight, how it feels, or how attractive it is. We only know how long it is. To provide an accurate account of the thing that was measured, we need to know many more things about it, and we need to construct a narrative that brings these things together in a meaningful way.

A really good psychological measure is similar. The LAS, for example, is designed to go to the heart of development, stripping away everything that does not contribute to the pure developmental "height" of a given performance. Without knowledge of many other things—such as the ways of thinking that are generally associated with this "height" in a particular domain, the specific ideas that are associated with this particular performance, information from other performances on other measures, qualitative observations, and good clinical judgment—we cannot construct a terribly useful narrative.

And this brings me to my final point: Formal measures, no matter how many great ones we design, should always be employed by knowledgeable mentors, clinicians, teachers, or coaches as a single item of information about learners that may or may not provide useful insights into their needs. Consider this relatively simple example: a given 2-year-old may be tall for his age, but if he is somewhat under weight for his age, the latter measure may seem more important. However, if he has a broken arm, neither measure may loom large—at least until the bone is set. Once the arm is safely in a cast, all three pieces of information—weight, height, and broken

SOME RIGHTS RESERVED

arm—may contribute to a clinical diagnosis that would have been difficult to make without any one of them.

It is my hope that the integral community will choose to adopt high standards for measurement, then put measurement in its place—alongside good clinical judgment, reflective life experience, qualitative observations, and honest feedback from trusted others.

Appendix: Reliability – Some Basics

There is a great deal of confusion in the assessment community about the interpretation of statistical reliability. This confusion results in part from the different ways in which researchers and test developers approach the issue. Researchers learn how to design research instruments, which they use to study population trends or compare groups. They evaluate the quality of their instruments with statistics. One of the statistics used is Cronbach's Alpha, an indicator of statistical reliability that ranges from 0 to 1. Researchers are taught that Alphas above .77 or so are acceptable for their instruments, because this level of reliability ensures that their instrument is measuring real differences between people.

Test developers use a special branch of statistics called psychometrics to build assessments. Assessments are designed to evaluate individuals. Like researchers, test developers are concerned about reliability, but for somewhat different reasons. From a psychometric point of view, it is not enough to know that an assessment measures real differences between people. Psychometricians need to be confident that the score awarded to an individual is a good estimate of that particular individual's true score. Because of this, psychometricians set higher standards for reliability than those set by researchers.

The table below will help to clarify why it is important for assessments to have higher reliabilities than research instruments. It shows the relationship between statistical reliability and the number of distinct levels (strata) a test can be said to have. For example, an assessment with a reliability of .80, has 3 strata, whereas an assessment with a reliability of .94 has 5.

Reliability	Strata
.70	2
.80	3
.90	4
.94	5
.96	7
.97	8
.98	9

Strata have direct implications for the confidence we can have in a specific person's score on a given assessment, because they tell us something about the range within which a person's true score would fall, given a particular score. Imagine that you have taken a test with a scoring range of 0 to 500 and a reliability of .94. The number of strata into which this assessment can be divided is 5, which means that each strata equals about 100 points on the 500 point scale. If your score on this test is 350, your true score is likely to fall within the range of 300 to 400.[1]

Statistical reliability is only one of the ways in which assessments should be evaluated. Test developers should also ask how well an assessment measures what it is intended to measure. And those who use an assessment should ask whether or not what it measures is relevant or important.

A Personal Counterpoint to Stein and Heikkinen

Michael Basseches

I want to start my comments with my personal applause for the work of all of those colleagues who have put tremendous effort into improving the systematic measurement of developmental phenomena. The many ways in which this body of work is of value is beyond the scope of my brief comments here. Here, I want to address the context in which Stein and Heikkinen review this work.

In my book Dialectical Thinking and Adult Development, published in 1984, I attempted not only to describe the organization and identifiable possible indicators of dialectical thinking as a form of organization of thought. I also tried to justify the claim that dialectical thinking represented a more developed form of thought than both universalistic formal thought and relativistic thought. This effort at justification relied heavily on philosophical argument and examples that demonstrated that dialectical thought represented a higher level of cognitive equilibrium – more differentiated, integrated, stable and adaptive. I saw the description and the justification offered as the core of the book’s contribution. The cross-sectional data, reported from my doctoral dissertation, that a group of college faculty demonstrated more development of dialectical thinking than a group of college seniors, who in turn demonstrated more development of dialectical thinking than a group of first-year college students was consistent with the argument, but not in any way a substitute for the philosophical argument. Quite likely there are other measures that would demonstrate parallel findings differentiating college faculty from seniors and seniors from first-years, e.g. mean income, mean number of children, and mean weight. However, such findings should not and would not be taken as indicative of development.

While I don’t mean to suggest that this very simple example is at all comparable to the very sophisticated approaches to empirical validation of measures that Stein and Heikkinen discuss, I bring it up to introduce important ways in which my own assumptions agree with and differ from theirs. I agree with their view, as summarized by Murray and Reams, that “there is a persistent fact/value confusion in the field of developmental research and application, in which higher levels of development are assumed, implicitly or without sufficient justification, to be desired and of superior value.” Where I think I differ from them, is in regard to what kind of justification of “superior value” is appropriate.

At an epistemological level, when it comes to the concept of development, I don’t believe that any amount or form of empirical data can substitute for philosophical argument. Development, as I use the term in my book and as I think is consistent with the Piagetian genetic epistemology tradition, remains an essentially philosophical idea. While Piaget’s contribution was to offer observations of ontogenesis as a novel way of addressing existing epistemological questions, ontogenetic data were used in the service of philosophical argument and demonstration, rather than offered as a substitute.

SOME RIGHTS RESERVED

Put simply, I would never want for any of my readers to adopt the view that dialectical thinking represented a more adequate form of cognitive organization, unless they could understand why and how it was more adequate. Nor would I accept as more adequate any proposed form of reasoning if I couldn't see why and how it was more adequate, no matter what the validity and reliability profiles of the measures were. I believe one can integrate empirical and philosophical justification, but neither can be reduced to nor be substituted for the other. If one is unable to appreciate the value of a supposedly more sophisticated structure of reasoning or action than one's own customary form, one should not accept its value until one has reached a point where one can understand its value.

With regard to dialectical thinking, my correspondence and interaction with the many who have showed particular interest in my work has indicated that in each case they have been attracted to dialectical thinking by some sense, (gathered perhaps in part from my own work and/or from their own intellectual adventures,) that there is something more complex and more epistemologically adequate about dialectical thinking. With regard to expectations about my own intellectual development, I expect, based on developmental theory, I would expect that I would begin the process of starting to appreciate a proposed "higher-level" structure only after I encountered the limits of my lower level structure, and began to glimpse the power of the novel alternative to transcend those limits. Further discovery, and a reorganization process would need to ensue before I mastered and fully grasped the value of the "higher-level" structure. This process is as it should be – totally appropriate.

From my perspective it would be a perversion of the developmental process if I rejected the adequacy of my own reasoning, simply because a developmental researcher—an authority figure—tested me using measures with quality-control approved stringent reliability and validity profiles and told me I had a low score. If a teacher expected me or others to do so, I would view him or her as a teacher intellectually disrespectful of his or her students—a kind of teacher who fails to promote real development. In my view we need fewer of such teachers, rather than a new cadre armed with such validated development measures to legitimize their authority. For clarification, I ask whether Stein and Heikkinen would view such teaching as ethical practice.

In considering such teachers, I begin to address the more pragmatic aspects of Stein and Heikkinen's argument, "If we want to see an integral and developmental worldview gain a real institutional foothold—radically reforming business, government, education, therapy, and our own sense of human potentials—we need to get serious about our quality control standards" (p. 19). Whether or not I want to see that happen would depend on *how* such a world-view might gain a foothold. Because I view as dangerous the idea that any kind of empirical validation of measures could substitute for the philosophical arguments on behalf of the value of developmental phenomena, the quote above raises for me the specter of people who neither understand nor are convinced by the arguments beginning to systematically evaluate other people, even choosing who to hire or who to promote in the workplace, based on standardized measures of developmental phenomena. I find this terrifying. It suggests a tyranny of measures that replaces respectful discourse and collective adaptation as the social context in which development does or doesn't occur. It suggests those with an integral and developmental world view becoming an elite that would use social institutions to ideologically and socio-politically dominate the "developmentally inferior."

I very much appreciate the work of Stein and Heikkinen and of the editors of Integral Review for encouraging discussion of this crucially important epistemological issue. Such discussion must be critical discussion, and it is critically important at a time when the measurement of adult development seems to be moving from the role of supporting conceptualizations of intellectual problems toward becoming a basis for the way people treat other people in the contexts to which Stein and Heikkinen allude. I also appreciate the invitation to participate.

Sincerely,
Michael Basseches

Michael Basseches, Ph.D., *a psychologist and psychotherapist, is Professor of Psychology at Suffolk University, Boston, Massachusetts and has a private practice of psychotherapy and psychotherapy supervision in Cambridge, Massachusetts and Lexington, Massachusetts. His research and scholarship have dealt with late adolescent and adult intellectual development, social development, and ego development, with emphases on higher education, the workplace, psychotherapy, and supervision of psychotherapy, as contexts for development. His dialectical-constructivist approach has been the foundation for two books,* Dialectical Thinking and Adult Development *(Ablex, 1984) and, with Michael F. Mascolo,* Psychotherapy as a Developmental Process *(Routledge, 2009), as well as articles on adult development, psychotherapy, higher education, and development in the workplace.*

Further Issues in Stage Metrics

Michael Lamport Commons

Stein and Heikkinen (2009) are mostly right in their characterization of the lack of metric properties of most stage theories. However, they leave out two very important facts. One is that the Model of Hierarchical Complexity (MHC) is a general theory and part of the normal Mathematical Theory of Measurement (Krantz, Luce, Suppes, & Tversky, 1971; Luce, & Tukey, 1964) applied to the phenomena of difficulty. This means that the nature of hierarchical complexity and its implications for measurement are not included in the Stein and Heikkinen account. Another is that the MHC is not limited to scoring applications, such as its Hierarchical Complexity Scoring System (HCSS; Commons, Rodriguez, Miller, Ross, LoCicero, et al., 2007) or Dawson's Lectical Assessment System (LAS; 2008). The MHC is also used to generate tasks for measurement of any entities' performances of tasks (humans, social organizations, animals, and machines) as well as for other applications (e.g., design of neural nets; see Commons & White, 2006/2009).

Without these facts included, Stein and Heikkinen and their readers miss the importance of the theory and its role in the LAS methods they discuss. As a mathematics-based, behavioral developmental theory of measurement, it is a content-free stage-and-transition step generator. As such, it is a paradigm that accounts for the existence of developmental behavioral patterns and, among other things, the stage theories that describe such patterns. These facts bear directly on—and strengthen—Stein and Heikkinen's arguments and should be considered in discussions of developmental metrics and their properties.

The Nature of Order of Hierarchical Complexity Scale and Transition Scale

The sequence of orders of hierarchical complexity are built out of a very simple definition.

One task is more hierarchically complex than another task if all of the following are true.

a) It is defined in terms of two or more lower-order task actions. In mathematical terms, this is the same as a set being formed out of elements. This creates the hierarchy.
   $A = \{a, b\}$ a, b are "lower" than A and compose set A
   $A \neq \{A,...\}$ A set cannot contain itself. This means that higher order tasks cannot be reduced to lower order ones. For example, postformal task actions cannot be reduced to formal ones.

b) It organizes lower order task actions. In mathematics' simplest terms, this is a relation on actions. The relations are order relations
   $A = (a, b) = \{a, \{b\}\}$ an ordered pair

c) This organization is non-arbitrary. This means that there is a match between the model-designated orders and the real world orders. This can be written as: Not P(a,b), not all permutations are allowed.

SOME RIGHTS RESERVED

By induction, one can build the whole sequence of orders of hierarchical complexity using just this definition and the assumption that there are elements. As a theorem, we proved that there can be only one such sequence of orders, the scale of the order of hierarchical complexity being ordinal. They are just counts of the number of times that a higher order action has organized a next order lower order action. Note that Order 1 consists of simple actions that do not organize action. Ordinal scales have indeterminately sized gaps (Luce, May, 2006 personal communication). The following case illustrates this. Person 1 is taller than person 2, who is taller than person 3, placing them in the order 1, 2, 3 from tallest down. But the first person is 6 feet and 1 inch tall, the second person is 6 feet tall, and the third person is 5 feet tall. The gaps between person 1 and 2 are not equal to the gaps for person 2 and 3 yet their ordinal numbers are 1, 2 and 3. Another theorem shows that all stage theories are subsets of the MHC but the reverse is not true (Commons & Pekker, 2009). See Appendix 1 for how the MHC organizes the orders and stages.

The nature of the order of hierarchical complexity scale and the corresponding stage of performance scale are missing from Stein and Heikkinen’s account. The orders are absolute, ordinal, and fractal. The orders have the same construction at each order per definition given above. There is no confusion between steps and orders. Not only are the orders in every domain and content the same, the steps are the same irrespective of order of complexity. The order scale and transition steps scale are both fractal as Ross (2008) points out. The transition steps have a more complex mathematical underpinning to them due to their fractal nature. As a consequence of the fractal nature of orders and transition steps, the next stage performance is always an attractor and not an ideal or teleological end.

The measure of hierarchical complexity of a task item, for example in an assessment application, is analytically represented by its Order of Hierarchical Complexity (OHC). The measure of stage of performance on a task item is empirically represented by the Rasch Scaled Score. The Model of Hierarchical Complexity can be used to generate a sequence of vignettes or problems varying in hierarchical complexity. Sequences are administered to participants. The data are Rasch (1960/1980) analyzed. Rasch performance scores on items are converted into Stage scores (See Appendix 2). Stage scores are regressed against the order of hierarchical complexity of each of the items from a sequence. People are not at a stage, their performances may be. We do find distributions of stage even within a single participant on different items of the same hierarchical complexity within a single task sequence. Items are at an order, item performances are at a stage, persons’ performances on a set of items are inferred from the stage of the adjacent items in a Rasch analysis. A Rasch Analysis simultaneously minimizes participant and item error.

To contrast it with traditional stage theories, the MHC is not a psychological or mental view of stage. As one can see from the definition above, there is no mention of content, context, participants, gender, specific tasks, domains, type of organism or machine, or any other specific aspects. It does not depend on culture, or economic status. It is not only independent of particular language but language itself. Therefore, the MHC is not philosophical, teleological, or prescriptive. It is not masculine or feminine because it has no content. It is also not participant dependant or psychometric because it is an analytic mathematical theory of task properties and not person performance. The Hierarchical Complexity Scoring System (HCSS) and Dawson's

Lectical Assessment System also do not need committees of experts to figure out exemplars to define orders as did, for example, Kohlberg's early work or Loevinger's. It is not just a developmental theory but enables mapping of developmental theory onto it because it accounts for the underlying structure of such theory. It is also about more than development. It enables more critical thinking about what comprises development and also more rigorous empirical methods because it separates task (order of hierarchical complexity) from performance (stage).

Comparing Skill Theory and the Model of Hierarchical Complexity

The closest and most compatible stage theory is Fischer's Skill Theory (1980). There are many similarities and some differences. Both theories were conceived of separately but Fischer's (1980) was published first. Fischer (1981, personal communication) suggested the sentential order but does not include it himself. Fischer also suggested the name for the abstract order. Fischer does not recognize the paradigmatic and cross paradigmatic stages (see Appendix). The similarities include the following. The notion of mapping is probably translatable in the organizing of actions. The levels and orders are roughly the same. There are three differences. Skill theory has tiers, which MHC does not. The tiers seem to limit the existence of the paradigmatic and cross paradigmatic orders and make it hard to add the sentential order. Rasch analysis (Karabatsos, 2001) is also part of Mathematical Theory of Measurement. The mathematical basis of the MHC, and the implications thereof, is what most distinguishes it from Fischer's skill theory.

History of the Model of Hierarchical Complexity

The Model of Hierarchical Complexity has developed over four periods

1. General Stage Model (GSM) 1 (Commons, & Richards, 1984). 1978-1983. Did not entirely separate task properties and performance properties. Signal detection was used to measure performance. Axioms had serious problems.

2. General Stage Model (GSM) 1984-1998. (Commons, Trudeau, Stein, Richards, & Krause, 1998). Task and performance were separated. Essentially correct informal axioms and definitions introduced. The transition steps were introduced. A scoring manual was developed. At the beginning of the period 1997 to 2006, Dawson had suggest that the gap sizes might be equal. This turned out not to be true as Luce (May, 2006, personal communication) pointed out.

3. Model of Hierarchical Complexity 1997-2008. Dawson (Personal communication, 1997; 2002, 2003) introduced the name Model of Hierarchical Complexity and Rasch analysis for measurement. Commons and Pekker (2008; Commons, Goodheart, Pekker, Dawson, Draney, & Adams, 2008) mathematically formalized the definitions and axioms to more closely meet the Theory of Measurement standards. The ordinal nature of the orders was more clearly articulated along with the indeterminate nature of gaps when they exist. Ross (2008) introduced the fractal nature of orders, stages, and steps.

4. MHC in mathematical refinement stage. The last of the problems of meeting the mathematical criteria in the Theory of Measurement are being addressed. Ross is doing

further research on transition steps and seeking collaborators to investigate how the fractal nature of transitions can be mathematically represented. Precision teaching has been applied to the issue of scoring and item construction.

As one can see from the periods the MHC can have faults, which so far have been able to be overcome. It is a testable theory: if there was an additional order discovered in between the orders now asserted, the theory would need revision (Falmange, 2009, personal communication)

Using the Model of Hierarchical Complexity

In mapping the mathematical orders of order of hierarchical complexity and of stage transition on to real world data, there are a number of considerations. Because the model does not call for global measures (e.g., of a person's "center of gravity"), it is possible to look at change trial by trial, choice by choice, task action by task action. Performance measures can be applied at any time scale to help uncover process.

The methodology is also flexible in contrast to instrument-dependent stage theories (e.g Loevinger, 1976, 1978; Rest, 1979 Rest, Narvaez, Bebeau, & Thoma, 1999). One can give tasks that are open ended, close ended using choice or preference, or rating scales for example with vignettes. One can even give tasks that vary in Order of Hierarchical Complexity (OHC) to animals who do not talk and also to computers. The mapping is not sample dependent and is not psychometric but analytic at its base. Because the MHC is analytic it can be mathematically true but not useful. Hence it is true that it does not depend on data but it is extremely useful in seeing if applications performed as predicted. For example, the order of hierarchical complexity predicts the Rasch scaled stage score performances on the same items with *r*'s ranging from .85 to .99. By contrast, other stage theories have no such independent variable much less one that works as well as order of hierarchical complexity (see Dawson, 2006).

Because of the flexibility of the time scale for both assessing stage and transition step, it is possible to determine within person distributions of both stage (Fischer, Stein, & Heikkinen, 2009), and step (Ross, 2008). It is possible to get longitudinal data of those distributions. The steps also have their distribution both within a trial or across trials. Theoretically one can make problems that determine the steps at a given stage so that interviewing and scoring are not necessary. The model helps understand the non-stage aspects of development. By examining the residuals after its effects of the Order of Hierarchical Complexity (OHC) it possible to identify other dimensions of difficulty and development as measured by performances.

Conclusion

Stein and Heikkinen's (2009) restrictive view of the MHC, limiting it to the scoring of speech and writing, is apparently because their main exposure is to Dawson's application of it in the LAS. The restriction does not do justice to the scope and power of the model, which largely enables their discussion of validity, metrics, and measurement in developmental theory. One implication of the model providing the content-free, underlying structure of developmental stages is that other stage theories could be mapped into the orders of hierarchical complexity and thus benefit from the same kind of strength in validity and metrics as the LAS benefits from.

Then, rather than being merely inductive schemes that cluster behavioral characteristics, they could rest on—and draw from—hierarchical complexity's strong theoretical and methodological bases, which currently they do not.

In addition to responding to Stein and Heikkinen's article, this writing would be incomplete without mentioning some final methodological implications of the model. One can have a true comparative cognition and evolutionary behavioral developmental account of the increased power or reasoning, problem solving, emotion, etc. (see Commons, 2006). The determination of power is based on making actual comparisons across different animal species and machines. This in turn leads to the possibility of constructing stacked neural networksⓅ (Commons, 2008; Commons & White, 2006/2009). Stacked neural networks are based on the recapitulation of evolution as shown by the increase in the number of neural network stacks, with potential to have actually intelligent computers and droids.

Appendix 1

Orders of Hierarchical Complexity and Structures of Tasks

Order Ordinal and Name	General descriptions of tasks performed
0 Calculatory	Exact without generalization. Example: simple machine arithmetic on 0s, 1s
1 Sensory or motor	Discriminate in a rote fashion, stimuli generalization, move; move limbs, lips, eyes, head; view objects and movement. Discriminative and conditioned stimuli. Example: Either see circles, squares, etc., or instead, touch them. O □
2 Circular sensory-motor	Form open-ended classes; reach, touch, grab, shake objects, babble; Open ended classes, phonemes. Example: Reach and grasp a circle or square. O □
3 Sensory -motor	Form concepts; respond to stimuli in a class successfully. Morphemes, concepts. Example: A class of open squares may be formed □ □ □ □ □
4 Nominal	Find relations among concepts. Use names and use them and other words as successful commands. Single words may be ejaculatory and exclamatory, and include verbs, nouns, numbers= names, letters= names. Example: That class may be named, ASquares.@
5 Sentential	Imitate and acquire sequences; follow short sequential acts; generalize match-dependent task actions; chain words together. Use pronouns. Example: The numbers, 1, 2, 3, 4, 5 may be said in order.
6 Pre-operational	Make simple deductions; follow lists of sequential acts; tell stories. Count random events and objects; combine numbers and simple propositions. Use connectives: as, when, then, why, before; products of simple operations. Example: The objects in a row of 5 may be counted; last count called 5, five, cinco, etc. * * * * * □ □ □ □ □ O O O O O □ / "} Q
7 Primary	Simple logical deduction and empirical rules involving time sequence. Simple arithmetic. Can add, subtract, multiply, divide, count, prove, do series of tasks on own. Times, places, counts acts, actors, arithmetic outcome from calculation. Example: There are behaviors that act on such classes that we call simple arithmetic operations. 1 + 3 = 4; 5 + 15 = 20; 5(4) = 20; 5(3) = 15

8 Concrete	Carry out full arithmetic, form cliques, plan deals. Do long division, follow complex social rules, take and coordinate perspective of other and self. Use variables of interrelations, social events, what happened among others, reasonable deals. Example: There are behaviors that order the simple arithmetic behaviors when multiplying a sum by a number. Such distributive behaviors require the simple arithmetic behavior as a prerequisite, not just a precursor. $5(1 + 3) = 5(1) + 5(3) = 5 + 15 = 20$
9 Abstract	Discriminate variables such as stereotypes; use logical quantification; form variables out of finite classes based on an abstract feature. Make and quantify propositions; use variable time, place, act, actor, state, type; uses quantifiers (all, none, some); make categorical assertions (e.g., AWe all die.@). Example: All the forms of five in the five rows in the example are equivalent in value, $x = 5$.
10 Formal	Argue using empirical or logical evidence; logic is linear, one-dimensional; use Boolean logic=s connectives (not, and, or, if, if and only if); solve problems with one unknown using algebra, logic, and empiricism; form relationships out of variables; use terms such as if…then, thus, therefore, because; favor correct scientific solutions. Example: The general left hand distributive relation is $x * (y + z) = (x * y) + (x * z)$
11 Systematic	Construct multivariate systems and matrices, coordinate more than one variable as input; situate events and ideas in a larger context, i.e., considers relationships in contexts; form or conceive systems out of formal relations: legal, societal, corporate, economic, national. Example: The right hand distribution law is not true for numbers but is true for proportions and sets. $x + (y * z) = (x * y) + (x * z)$; $x \cup (y \cap z) = (x \cap y) \cup (x \cap z)$ *Symbols:* $\cup$ = union (total elements); $\cap$ = intersection (elements in common)
12 Meta-systematic	Integrate systems to construct metasystems out of disparate systems; compare systems and perspectives in a systematic way (across multiple domains); reflect on and name properties of systems. Example: The system of propositional logic and elementary set theory are isomorphic. $x \& (y \text{ or } z) = (x \& y) \text{ or } (x \& z)$ Logic; $x \cap (y \cup z) = (x \cap y) \cup (x \cap z)$ Sets T(False) $\Leftrightarrow$ φ Empty set; T(True) $\Leftrightarrow$ Ω Universal set *Symbols:* & = and; $\Leftrightarrow$ = is equivalent to; T = Transformation of
13 Paradigmatic	Integrate or discriminate how to fit metasystems together to form new paradigms. Includes ability to show that there are no ways to fit together any set of metasystems. $\Omega_1 \circ \Omega_2 = \Psi^a$ *Symbols:* Ω_n = e.g., Algebraic Metasystems; Ω_n = e.g., Geometric Metasystems; Ψ^a = Analytic Geometry as a paradigm
14 Cross-paradigmatic	Integrate, compare, reflect on and name properties of paradigms within or across domains. Fit paradigms together to form new fields.

Appendix 2

Because of the discussion of metrics in Stein and Heikkinen (2009), it is important to point out the difference in formal measurement theory terms between the orders of hierarchical complexity, which is an ordinal scale analytic measure, and the corresponding measure of performance Rasch scaled item and person scores which is conjoint. As Perline, Wright, and Wainer, (1979) state, “the Rasch (1960) model is a practical realization of conjoint measurement (Brogden, 1977; Fischer, 1968; Keats, 1967, 1971). Tversky (1967) discussed the Bradley-Terry-Luce choice model, which is closely related to the Rasch model, in terms of conjoint measurement. Young (1972) also considered the Bradley-Terry-Luce model in these terms and remarked generally that "the scaling methods in psychometrics conform to the notion of polynomial conjoint measurement.”

One would like to have a person stage of performance score. But there is no simple and direct way of obtaining that score from a Rasch analysis. A Rasch scaling procedure minimizes errors of fit to both persons (participants) and items at the same time. The Rasch map displays the person performance scaled values on the left side of a linear vertical scale and the items scores on the right side of that same scale. But the problem is that Rasch scores are not in the stage metric. And, to make things more curious, the order of hierarchical complexity is ordinal and cannot be averaged, summed, or even subtracted. But the Rasch scores can. Hence the interpolation between adjacent orders of hierarchical complexity of items is based on the Rasch scale for which interpolation is fine. This is because the Rasch scale is a conjoint measure which allow for summing.

To find the person performance stage from the adjacent corresponding items’ order of hierarchical complexity, one can interpolate between the items’ hierarchical complexity. There is no assumptions about the size and nature of a possible gap. The Rasch scale is linear between OHC because Rasch is a conjoint measure. This can be done by translating the Rasch scores into stage of performance scores based on the corresponding absolute values of the order of hierarchical complexity of the items. They represent the stage of a person’s performance according to the Model of Hierarchical Complexity. A person’s stage of performance score is calculated by using the equation:

$$StageofPer\,son = \frac{PersonRasc\,hScore - StageMean_1}{StageMean_2 - StageMean_1} + ItemHC$$

Stage of Person = Stage of performance of person in Order of Hierarchical Complexity number.
Person Rasch Score = The Rasch Scaled performance score for a person.
Stage Mean = Mean Rasch Score for items of a given hierarchical complexity.
Item HC = Items order of hierarchical complexity.

This relationship between the two scales allows for using local interpolating between items with adjacent orders and not overall. After this transformation the obtained stage of performance scores for persons can be compared. This is useful in doing a factor analysis.

A Practitioners' Perspective on Developmental Models, Metrics and Community

Chad Stewart, Zach Smith and Norio Suzuki

Abstract: This article builds on a paper by Stein and Heikkinen (2009), and suggests ways to expand and improve our measurement of the quality of the developmental models, metrics and instruments and the results we get in collaborating with clients. We suggest that this dialogue needs to be about more than stage development measured by (even calibrated) stage development-focused, linguistic-based, developmental psychology metrics that produce lead indicators and are shown to be reliable and valid by psychometric qualities alone. The article first provides a brief overview of our background and biases, and an applied version of Ken Wilber's Integral Operating System that has provided increased development, client satisfaction, and contribution to our communities measured by verifiable, tangible results (as well as intangible results such as increased ability to cope with complex surroundings, reduced stress and growth in developmental stages to better fit to the environment in which our clients were engaged at that time). It then addresses four key points raised by Stein and Heikkinen (need for quality control, defining and deciding on appropriate metrics, building a system to evaluate models and metrics, and clarifying and increasing the reliability and validity of the models and metrics we use) by providing initial concrete steps to:

- Adopt a systemic value-chain approach
- Measure results in addition to language
- Build on the evaluation system for instruments, models and metrics suggested by Stein & Heikkinen
- Clarify and improve the reliability and validity of the instruments, models and metrics we use

We complete the article with an echoing call for the community of Applied Developmental Theory suggested by Ross (2008) and Stein and Heikkinen, a brief description of that community (from our perspective), and a table that builds on Table 2 proposed by Stein and Heikkinen.

Purpose of this Article

We appreciate the outreach by Tom Murray and Jonathan Reams to invite us into the "community of engagement" (not yet a "community of practice") around building a network (and eventually Institute?) for Applied Developmental Theory—as well as Ross (2008) for the original call for the Institute, and Stein and Heikkinen (2009) for picking up the call.

Our purpose in writing this article includes three objectives:

1. Propose a concrete (meaning it has been used and refined with several groups of end-user clients as well as integral practitioners) and granular (meaning it includes multiple levels of technologies that allow users to "drill down" into increasingly narrow and precise applications) application of Ken Wilber's Integral Operating

SOME RIGHTS RESERVED

System (IOS) for our dialogue around the innovation and application of developmental models and metrics because a quality control focus and concentration on linguistic-based metrics are necessary, but by no means sufficient.

2. Contribute to the creation and increased coherence of a collaborative community that improves the functionality and ethical application of developmental models with individuals, organizations and societies.

3. Attempt to contribute to the dialogue in ways that "integrate first, second, and third person perspectives, and illustrate an author's embodiment of higher (second tier, integral, meta-systematic, etc.) levels of ethical and psycho-socio-systemic reflection" from a perspective of "authenticity/vulnerability/empathy and rigor at levels rarely seen in academic discourse" (Murray & Reams, invitation letter to this dialogue).

Objective #1 is addressed in the content of the article, while Objective #2 is the context we are building through our dialogue about creating a coherent community of practice around improving the functionality and ethical application of developmental models and metrics, and Objective #3 is the process of how we engage in this dialogue.

Background and Bias

As part of our attempt to embody Objective #3, we shall begin with a brief overview of our background and bias. Our work in building communities within organizations and within communities among organizational leaders has led us to a deep respect for the need to manage the dilemmas raised by respecting and integrating multiple perspectives, abstract models and concrete metrics and tools. Having spent over ten years working as change agents within and for large corporations, government organizations and NPOs biases us towards "what is possible right now, with these people to whom we have a fiduciary responsibility, in this context" while also attempting to move with these people towards a more ideal position over time. Furthermore, we are biased by our experience and results with our colleagues and clients in:

- Talent development (executive team development, succession planning, leadership competency development),
- Organization development (M&A integration, cultural integration, systems & processes improvement, performance improvement),
- Change management (cultural transformation from one structure, state, system and/or stage of development to one more fitting to its environment based on demands on the organization from its value-chain and market), and
- Social entrepreneurship in building and running our own organizations (Abound, Integral Japan, Interkannections) in Japan and the US.

These experiences and results bias us toward:

- Weaving together practical application and emergent design in the field (the use, adaptation and creation of technologies that work at that point in time and in that specific context with those specific people) with research and theory-building in the think-tank (building and refining models and metrics that serve as general guidelines for fieldwork and are improved by what emerges from the field) over taking either stance alone.

- A "fit-to-role" perspective that we should be looking at "multi-dimensional degree of fit" as a set of metrics over a single "higher is better" metric.

- The need to simultaneously and cohesively evolve both individuals and the system and community that houses those individuals to be more "fit-to-role" over either an "individual focus" or "organizational focus" (our experience indicates that without cohesive transformation, the effect is diluted and reversion to previous patterns is likely).

- "Dilemma management" (individual & collective plus current & target poles) and legal (e.g. "personal information" law in Japan) approach to the ethical question of how much "developmental" information a person or team should share internally (and in what form and to what degree this information should be accessible by HR, a person's managers, and top management) over a "coach-client privilege" approach. Usually we have created "leadership profiles" that are available to the leader's manager, manager's manager, CHRO, and program sponsor—CEO or Senior VP. Often the members have chosen to share their developmental information with their team.

- "Results orientation" that measures and improves both "lead indicators" (predictors of performance such as developmental stage and level of competencies directly related to the task at hand for individuals and cultural stage and degree to which systems and processes are able to deal with the task at hand for organizations) and "lag indicators" ("qual-and-quant" measurements of actual results such as level of trust by team members and project costs reduced for individuals and social reputation, brand image, increased profitability and return-on-investment, increased number of people fed, educated and pollution mitigated for organizations). Most integral-related developmental models and instruments that we have seen to date are focused exclusively on "lead" indicators and therefore deprive both suppliers and customers of these models and instruments of the ability to truly test half of the benefit to the individual or organization. Notably, most of the clients we have worked with have at one point or another expressed some variation of "honestly, I just want the results."

- Requirement of fieldwork and client-needs to adjust or transform models, metrics and instruments to reflect changes in clients, context and the market environment over keeping these tools static

In short, we see ourselves as world-class developmental practitioners and guidance professionals, but not world-class organization and community leaders or academics. Therefore, we are strongly interested in collaborating with world-class organization and community leaders and academics to work through (among other issues) the complexity raised by the points above.

Given the current approaches to working with developmental models and metrics, we also strongly feel the need for a more concrete granular integral framework for addressing development. Before briefly presenting one such framework and its applicability to our community and identifying and resolving the core issues we face, we will take a first look at some of the models and instruments capable of assessing development at individual and collective levels.

Developmental Models and Instruments

For the reasons stated above, we propose that our community address developmental models and instruments designed to measure "lead" and "lag" indicators of performance at individual, team, organizational and larger society (e.g. city or national) levels of scope. We also propose that our community clearly indicate:

1. Which models and instruments are most relevant and qualified to measure lead and lag metrics (indicators) for which purposes—and why.

2. Which models and instruments are least (or not) relevant and qualified to measure lead and lag indicators for which purposes—and why.

Here, we provide a partial list of developmental models and instruments by level of scope. After discussing the framework and related issues involved in using and adapting the models and instruments in the next section, we conclude with a "work in progress" chart at the end of the article which builds on the chart presented by Stein and Heikkinen (2009) and provides our current perspective of which models and instruments are more and less relevant and qualified for which purposes and why. We look forward to continuing to refine this chart with the community.

Table 1. Partial List of Models and Instruments by Scope

Model	Instrument(s)	Scope	Supplier
Abundance / Sustainability	Organizational Sustainability Scorecard	Team Organization	Interkannections
	City & Community Sustainability Scorecard	City/Community Region	
Cultural Transformation Tools	Individual Values Assessment	Individual	Values Centre
	Leadership Values Assessment	Individual	
	Small Group Assessment	Team	
	Cultural Values Assessment	Organization (Nation)

	BusinessSCAN, SchoolSCAN	Organization	
	CommunitySCAN	Community	
	CultureSCAN	Team, Organization, Community, Nation	
Subject-Object Theory	Subject-Object Interview	Individual	Kegan, Lahey & associates

Given the sheer number of instruments available, especially individual-focused instruments, it initially appears that competition is inevitable. To some degree this may be the case, but an integral analysis of the instruments (see below) will show that most of the instruments are only practically useful for specific purposes and/or in specific circumstances—and that many of these conditions do not overlap. Using the instruments too far outside of these specific conditions fails to serve the client, and holds the possibility of damaging the reputation of the "developmental model and assessment" market. As self-proclaimed leaders of this community, it is in the best interest of ourselves, our clients and our colleagues to clarify which models and instruments are effective (and ineffective) in which conditions. The framework outlined below will help us in assessing the efficacy of the models and instruments in various conditions.

Concrete Granular "5C" Framework

We propose that one of our collective purposes in this dialogue and community-building initiative is to take a practical "concretized" integral approach to the metrics, measurement and application of developmental models in order to add perceived and actual value to our clients (e.g. change leaders, organizational leaders, HR professionals, and the communities within which they operate), our colleagues and ourselves. For this to occur, it is necessary and (as a concrete next step) sufficient for us to include and integrate the rigor of traditional means of judging models and metrics (e.g. "validity" and "reliability") while also transcending them by placing them within a fully integral framework. Based on our collective experience as change agents we believe such an applied framework needs to include all five of the minimal integral requirements proposed by Wilber's Integral Operating System (1995, 2000, 2006), namely quadrants, stages/levels, styles/types, streams/lines, states/consciousness in a way that can be easily applied and adapted by various constituencies (on a wide scale). Without this scalability, we will be less able to attract clients who will actually purchase, use and measure the results of products (instruments) and services based on these models, as well as interesting colleagues to collaborate on improving the instruments and related services.

Since we have spent the last 10 years evolving and refining a framework with US, European and Japanese-based corporations, government organizations and NPOs (after originally working with the 4Q and Spiral Dynamics and other organization development tools in these organizations), we are proposing the use of this applied framework ("5Cs") as a starting point for this community. (We originally called it "5S" for spheres/quadrants, stages, styles, streams and states, but clients kept saying "McKinsey has a 7S framework").

These interwoven "5Cs" are:

1. Context Interface
2. Core Capacity
3. Character
4. Competencies
5. Consciousness

It is also crucial to implement these 5Cs in a cohesive way.

We shall briefly cover each of the 5Cs and their cohesion, and then use the 5Cs to address some of the issues raised by Stein and Heikkinen (2009) as well as new issues that come to light in using the 5Cs to address the innovation and application of developmental models and metrics. Since readers of the IR are "integral savvy," we shall assume competence in the integral operating system (IOS), and build our brief overview of the 5C on top of this assumed shared understanding.

Context Interface

Context Interface begins with the integration of a slightly modified version of Ken Wilber's "4 Quadrants" or "4Q" (it has simply been turned counter-clockwise 90°) with the "Iceberg Model" from intercultural studies. The lower half of the diagram is the invisible ("below the waterline") dimension of individuals and groups that cannot be seen, such as values, beliefs and emotions, perceptions, mindsets and assumptions of individuals; and the culture, climate, collective consciousness, norms and shared assumptions of groups. The upper half of the diagram shows the visible ("above the waterline") behavior of individuals (their actions and reflection) and groups (their structures, systems, processes and dynamics) and the results they generate. Without conscious practice, the number, relationship and complexity of these factors in each situation makes the situation difficult for us to grasp, and easy to misunderstand. By mapping and adjusting to the influence and relationships of these various elements, we are able to better understand, act and reflect on the intersection of our external environment and behavior, our internal drivers and filters, and the results we co-create.

Figure 1: Context Interface (Integration of Wilber "4Q" with the Iceberg Model). Reproduced with permission.

Many granular technologies build from this first Context Interface diagram, but for the purposes of this article, the Iceberg 4Q will suffice.

Core Capacity

Our Core Capacity is the baseline from which we perceive, understand and act in the world on a relatively stable basis. The internal dimension of capacity is often called "stages" or "lines" in the developmental literature. In an initial burst of research, we cross-referenced developmental stage models created and used by 19 teams of developmental researchers and practitioners and found a high degree of correlation on both the internal stages (structures) and contents between these teams (charts that show the correlation is available on the Interkannections website). The research identifies distinct stages in human development based on cognitive, emotional, ethical, needs, social, and values models (and often metrics) and the ego that unifies them. We have integrated this knowledge with the latest research in leadership and global management competencies to create our Leadership Capacity model ("X" to "O"), shown below correlated to each of Dr. Susann Cook-Greuter's stages of Ego Development (2002, 2004). We will not go into the levels ("X" to "O") here, but interested parties can find these in the "Leading Evolutionary Change" whitepaper on the Resources page of the Interkannections website. The color scheme is similar to that suggested by Wilber (2006), but has been customized to use Spiral Dynamics (except for "Expert" / "I") and other color schemes according to the needs of the context of application.

Character

As people and professionals, the character of each of us is both unique and is strongly influenced by a variety of "styles" that have emerged within ourselves and the cultural environments in which we were raised and shaped. The "style" influences that our clients have found most useful and influential to work with (and therefore the base which we can add to as a community) include:

- Personality style (e.g., Enneagram, DiSC, Myers-Briggs)
- Organizational hierarchy and functional (R&D, Production, Sales, HRD, flat, distributed networks, etc.) styles
- Organizational cultural style (Gareth Morgan's organizational styles, stages of organizational culture development ala Barrett and Adizes)
- National/ethnic cultural style (polarity management & dimensions of culture, Enneagram, stages of cultural development)
- Gender style (masculine and feminine, yin-yang)
- Family pattern style (discussion-based, authoritarian, no model or theory)
- Educational environment style (discussion-based, context based, experiential, drilling, no model or theory)
- Religious and/or philosophical style (mono-theistic & poly-theistic, internal & external locus of responsibility and control)

Competencies

Competencies are the specific skills that allow us to engage in a specific activity or practice (e.g., being a parent, running an organization, leading a project or division, building a community, playing tennis, playing the piano, mixed martial arts, writing a book, painting a picture, singing, applying and improving developmental models, etc.) and achieve a certain level of results.

To use a metaphor that is meaningful to most of our clients, Core Capacity is the "size of the container" that we have to perceive, understand and act in the world and Competencies are what goes into that container. Both of these must be matched to the context. If the context requires a project leader, then the Capacity of "T" (Achiever/Orange) may be most appropriate because this is the stage at which project management and integration can really begin to be leveraged. Competencies should also reflect the needs of project leadership (e.g., time management, schedule management, budget control, communication, risk management, etc.).

Even a world-class MBA professor or leadership researcher who has a Core Capacity of "A" (Strategist/Yellow or Teal) would be unlikely to successfully lead a project or organization (and may cause considerable damage) if they have not successfully led teams or organizations before and have not been trained in the Competencies of project management or running an organization. Conversely, project leaders approaching project management at an "I" (Expert/between Blue or Amber and Orange) center of gravity can severely slow or damage the project due to a tendency to focus more on the parts than the whole.

In working with change leaders, change projects and organizations, we have found it useful to focus on both the specific Competencies required by a person for a project or situation in a specific context as well as the Categories (groups) of Competencies that are required for specific kinds or levels of change projects and/or organizational leadership.

Consciousness

In the 5C framework, Consciousness (our "state" of being) is the way in which we perceive, understand and act in the world moment to moment. The quality of our Consciousness affects the quality of our experience, results and affect on and with other people and our environment/context. Our quality of Consciousness in any given moment is affected by our health and balance within and between several spheres of Consciousness. For our work, we focus on four interconnected spheres of Consciousness:

1. Body (Physiological): This is the awareness of movement of energy in the body, how we breathe, how we sleep and dream , how we align ourselves and our posture, how we are affected by what we eat and drink, the quality and amount of exercise we get, our body temperature, and other physical conditions.

2. Emotions (Affective): This is how well we assess and manage the feelings, sensations and moods that arise within us such as joy, anger, sadness, boredom, frustration and hope—how we respond to them and, sometimes, how we feel pulled from one pole to another in short periods of time.

3. Mind (Cognitive): This is how we process information, what we commit to, how we organize meaning and information to exchange it and communicate with others, and our ability to predict and change the consequences of our actions.

4. Connection (Social & Spiritual): This is our felt sense of connection to that which we sense is beyond us, both in terms of a wider group of people and a deeper way of being. It includes faith, our mission/purpose, development and application of values, sense of potential, and the level of resonance, trust and conflict we have with others.

"5C" Coherence

Each of the "5Cs" brings an important perspective and set of questions to the application and improvement of developmental models and metrics. As integral practitioners and theorists, we know that insufficiently addressing any one of the "5Cs" (by whatever name and level of granularity) can leave a critical gap in awareness, assessment, individual action and aligned action that can create problems in supporting the development of individuals, organizations and cities and communities. As powerful as each of the "5Cs" is by itself, however, their true transformational power lies in understanding and engaging the connections and interplay between the "Cs" and bringing them into coherence as they relate to each specific undertaking, environment, and the people involved—and then taking that learning back into the refinement of the evolving model and metrics in a virtuous cycle of development. The way that we judge the effectiveness of our 5C Coherence is to measure the specific results that accrue in a six-level model of "stages of sustainability." We will not provide an overview of the Stages of Sustainability here, but interested parties can find these in the "So, How Sustainable Are We?" whitepaper on the Resources page of the Interkannections website. The model actually has 10 stages (including the "levels of un-sustainability") and is still a work in progress, but has been tested with corporate, government and NPO clients and allows us a reasonably accurate method (from the perspective of ourselves and our clients) of judging the developmental results of a person or organization's actions because it focuses on real-world results (external, verifiable phenomena). It therefore allows us an external cross-check (using both lead and lag indicators) to the results of most developmental models which are primarily (often highly accurate) assumptions of internal development (and provide mostly lead indicators only). In the end, we cannot prove that someone is operating at an "A"/Strategist/Yellow or Teal "center-of-gravity," but we can prove that the organization they are leading is producing triple-bottom-line value to their employees, customers and community (e.g. Burgerville's full health care coverage for even part-time employees, bio-degradable utensils, all power purchased from wind-energy credits, financial contribution to education, financial out-performance of industry competitors in same location).

Using the 5Cs and their Coherence, we shall now turn to "our current top 4" issues that we suggest our community address related to the use and improvement of developmental models and metrics.

"Current Top 4" Issues of Developmental Models and Metrics

In our developmental guidance work with clients, we have found that an effective place to begin is to work together in defining the scope and framework of our initiative, discovering the core issues, and crafting initial solutions. We appreciate the issues proposed by Stein and Heikkinen (2009), including:

1. The need for quality control.
2. Defining and deciding on appropriate metrics, and
3. Building a system to evaluate models and metrics.

4. Clarifying and increasing the reliability (are the instruments and metrics accurate) and validity (do the instruments and metrics measure what they claim to measure) of models and metrics.

We suggest expanding the frame of these four issues as described below. We also suggest distinguishing "metrics" from "instruments" since some instruments provide one metric (e.g. MAP) and others provide multiple (e.g. organizational sustainability scorecard). Stein and Heikkinen initiate a dialogue on several other issues, but here we will respond to/build on those above because we perceive them as "core issues" (root causes) rather than "presenting problems" (surface level issues that stem from core issues) for our community. We look forward to working with members of this community on uncovering these and other core issues and collaborating on cohesive solutions to resolve them. In the spirit of this exploration, here are our "current top 4:"

1. Adopt a Systemic Value-Chain Approach: We suggest expanding our community's discussion from the current QC focus (Stein & Heikkinen, 2009) to include additional "nodes" of the value-chain. Usually, this includes internal value-chain nodes (strategy, HR, operations, IT, R&D, production, quality control, sales & marketing, service/delivery, customer service, etc.), external value-chain nodes (supply chain entities, customers, end-users, competitors, strategic partners, etc.) and SPECTREM entities and factors: Social, Political/Governmental, Economic, Cultural, Technological, Religious, Ecological and Military. For our purposes, however, an effective next step would be to look at eight nodes:

1. Strategic Partnerships/Community-building (how do we gather our "best in class" members of the Applied Developmental Theory community and collaborate while also building our mutual bottom-lines—rather than simply competing as small niche players in the leadership development, OD, change management and similar markets?)
2. Strategy (what are we intending to do with the models and instruments and how will we do this—5C analysis?)
3. Clients & Customers (which current and potential customers "fit" our strategy form a "5C" perspective?)
4. R&D (what tools do we have now, how can they be improved, and what new tools do we need to develop?)
5. HR—includes Production & Service/Delivery (who do we have that can develop, improve and implement those tools and how do we develop these people to meet these demands?)
6. QC (how do we set and maintain quality control standards in the community?)
7. Sales & Marketing (how do we increase our work with our current and target customers?)
8. Customer Service (how do we ensure that we are meeting our customers' needs and receive useful feedback that improves strategy, R&D, HR and QC?)

Naturally, we are suggesting that we gather people together who can add 5C value to our community. We propose that members should be able to provide high-quality input and performance (competencies) to one or more nodes (functional character) that illuminates the value-chain (context interface) in a way that is mutually respectful, supportive and collaborative (consciousness) while operating at a high level of perception, understanding and action (capacity) and individually and collectively delivering cohesive results (cohesion/sustainability stages).

2. Measure Results in Addition to Language: Stein and Heikkinen (2009) state that

> building a metric entails moving from … everyday interpretation of language towards more systematic modes of differentiating between different types of linguistic performances. Importantly, with the exception of a few experimental paradigms (e.g., Piagetian balance beam tasks) all developmental metrics entail the interpretation of linguistic performances. This point is often overlooked. (p. 10)

As far as we know, the "experimental" part is correct. We also started out using solely linguistic-based instruments that used soft or calibrated metrics to measure lead indicators such as personal "action logics" and cultural stages. However, we kept running into the issue that our clients have all preferred results over "valid" and "reliable" metrics. Therefore, we have also built and "trialed" instruments with clients that measure both the internal ("below the waterline") capacities, character styles (and individual consciousness) as well as external ("above the waterline") context interfaces, competencies, behaviors and results of individuals (leader profile, 360 CAP) and organizations (business sustainability scorecard). We are currently developing one for cities & communities (city & community sustainability scorecard) as well. Although these are far from perfected, it does seem that externally verifiable metrics that measure lead and lag indicators are easier to cross-check (by colleagues) and understand and use (by clients). If part of our intention is to get fully integral (IOS-based) instruments and metrics in widespread use, we need to create and sell instruments, and "packages" of instruments (blatant plug for collaboration) that covers the full range of the IOS and are appealing to clients and potential clients (e.g. provide measurement of results). For example, if a potential client wants us to help them develop a leadership and engineering team that can produce a new eco-car that will outsell the Toyota Prius and reduce energy consumption by 15% and raw material usage by 10%, it is better for everyone involved if we can say more than "the cultural center-of-gravity of your organization is ABC, a requisite version of your organization would be DEF, the action logics of your leadership team are GHI, and your LDMA results indicate that your should focus on improving JKL next." It is beneficial if we can say something like: "Your current financial, social and ecological results are MNO (cohesion/sustainability stages) while your mission, targets and value-chain requires them to be PQR (context interface). This requires A-L (capacity shift above), changing from a production and sales focus to a value-chain integration focus (character/culture) and building STU competencies in your leadership and R&D teams (competencies) while increasing employee loyalty by X% in this economic environment by building a reputation day by day of becoming a truly sustainable organization (consciousness). All of this indicates that we should do VWX to get that car built." And then follow up every 3-6 months showing them the improvement in both lead and lag indicators—including the actual financial, social and ecological results. If we do this with an increasing number of corporate, governmental and NPO clients, our hypothesis (and experience) is that the interest in developmental models and instruments (with their associated metrics) will continue to increase.

3. Creating an Evaluation System for Models, Instruments and Metrics: Stein & Heikkinen (2009) call for "languages of evaluation that focus on the most important qualities that bear on

the worth of both metrics and models" (p. 13). Interestingly enough, once the evaluation is complete, the "last metrics standing" are the Lectical Assessment System (LAS) instrument (which is directly linked to Stein), the Hierarchical Complexity Scoring System (HCSS) instrument (which is noted as "an early version of the LAS"), and perhaps the Requisite Organization (RO) model (it is noted that the creator of RO, Jacques, and his colleagues drew parallels between their metrics and those of Fischer and Commons, whose work serves as the foundation for the HCSS and LAS). Hmmm, this self-promotion is rather like ourselves and the 5C framework. OK, so we can all acknowledge a strong "T/Achiever/Orange" streak in at least several members of our budding community. On the other hand, certain other members of the community (e.g. Cook-Greuter and Beck) seem to be less interested in leveraging that T/Achiever/Orange streak. Combining this issue of "wisdom with limited self-promotion" in some members with the need to create an evaluation system that is meaningful to clients as well as colleagues leads us to add a few categories to "Table 2" in Stein & Heikkinen (2009, pp. 17-18). Again, our hats off to them for initiating this part of the process. We are certainly not experts in psychometric quality, and therefore look forward to partnering with community members who are. As stated before we do stand by our experience with several large-scale interventions and wide-ranging work with hundreds of organizational leaders. So, by leveraging our community's diverse perspectives, we should be able to come up with a concise and powerful evaluation system. We suggest:

1. Expanding "metric" to "model," "instrument" and "metrics" (see above).

2. Adding "scope" since most models, instruments and metrics can be used with either individuals or groups (it is neither time nor cost effective—and usually inaccurate—to "roll up" dozens or 100s of LAS or MAP instruments into a composite "organizational culture baseline" score) and some collective-focused instruments are built to assess an organization, but would not work with a city.

3. Adding "indicators" since listing the lead and/or lag indicators provided makes it easier to see what the model or instrument is measuring.

4. Adding "5C categories" since our developmental assessment of organizations and selection planning of candidates above Senior Manager roles should include their current, target and growth in context interface, character/cultural style, competencies, consciousness and degree of coherence as well as capacity (see #2 above).

5. Adding "language" since most instruments are available in only a few languages and some may not work across language barriers (e.g. sentence completion tests do not work grammatically in Japanese in our experience).

6. Expanding the content of "source" by adding feedback and perspectives from value-chain stakeholders in addition to academics.

7. Changing "publication type" to "evaluation type" and expanding the categories to include fieldwork (e.g. "pre-test with colleagues," "focus group," "client trial").

8. Expanding "aspect of psychometric quality addressed" to "reliability & validity" (see Issue #4 below).

We add these categories to Table 2. Sources not found in the References section are found in Stein and Heikkinen (2009).

4. Clarifying and Increasing the Validity & Reliability of Instruments, Models & Metrics: Stein & Heikkinen (2009) are clear that they are focusing solely on developmental psychology models and metrics based on linguistic responses (and all instruments and models in their article deal solely with Core Capacity). Within these parameters, they seem to be concerned about the validity and reliability of the instruments, models and metrics they discuss (again, with the exception of the LAS, HCSS and RO). This is an extremely important point, especially if we work solely with Core Capacity-focused, linguistic-based, developmental psychology instruments and market to and work with our clients consistently from a "T/Achiever/Orange" point of view that assumes "the truth is out there" and can be disclosed by one or more instruments. This is a conundrum that we have not often shared, since in virtually all work with clients to date (after a single, mutually-traumatic experience with a former key client), we have mitigated this risk using one or more of the following practices:

1. Provide the client with a "Quality of Results Rating" (QORR) that shows the rough reliability of the instrument alone and when packaged with other components. This is all we have done to date when the client is purchasing only the instrument results (more than 99% of our clients to date have purchased packages such as leadership coaching, executive development, OD or change management rather than single instruments). Since over 99% of our hundreds of clients have chosen packages, the QORR is based on the results of our instruments cross-checked against longitudinal scores from multiple instruments, observations and lag indicators and cross-checked against what the clients DO and GET (see #3 below).

2. Provide scheduled time for our scoring team community of practice (COP) to consistently refine and granulate the categories that we make within our meta-model and use within our instruments to define specific metrics. Our COP also consistently cross-checks our meta-model and categories against evolving and new models, metrics and instruments that claim to measure the same things, engages in learning from thought leaders, and engages in dialogue with key colleagues. These are our primary ways of dealing with validity.

3. Engage the client in a "5C" dialogue that helps identify "where they are," "where they are going," and how we can be most helpful in their journey. Although this often involves Core Capacity transformation (since most of our clients are G, I or T people in the roles of intercultural managers (requires "H" results) or multi-national organizational leaders (requires "A" results), it also almost always involves some combination of Consciousness, Context Interface, Character, Competencies and Cohesion since the key phrase here is "requires results" and NOT "requires Core Capacity." We have found (learned in our traumatic experience and verified in every case afterwards) that even "pre-conventional" leaders like to discover for themselves

"where they are" and not be told by consultants who are not actually responsible for the results themselves. We are speaking here of the organization leaders we have encountered, and cannot confirm whether this pattern holds true in the general population.

4. Provide three forms of feedback: what the clients have done (DO) and the results they get (GET) in addition to what they say and what judge of their interior from how they respond on instruments (BE). This provides a very concrete form of "tangible to intangible" or "visible to invisible" reliability cross-check to use the 4Q Iceberg model. Since "psychometric" checks deal only with intangible (internal) reliability and validity and does not include the reliability & validity of tangible results such as those provided by lag indicators (e.g. profits increased, increased number of lives saved, tons of carbon sequestered, etc.), we suggest expanding our definition of "development" to include tangible/visible measurement as well.

To summarize, developmental models, metrics and instruments need to be about more than stage development measured by (even calibrated) Core Capacity-focused, linguistic-based, developmental psychology metrics that produce lead indicators and are shown to be reliable and valid by psychometric qualities alone. Development, client satisfaction, and contribution to our communities additionally have benefited greatly from a cohesive 5C approach with clear, verifiable real-world results. A community that addresses these issues and produces a systematic and clear overview of which instruments, models and metrics best (or even moderately) provide tangible value to which clients in what contexts and conditions and works to improve the instruments, models, metrics and overview is the community that we want to co-create with you. As a first step, we end this article by building on Table 2 from Stein and Heikkinen (2009) and the invitation to help us continue to evolve this work together.

Warm regards, Chad, Norio and Zach.

Table 2. Capacity Models and Instruments

Model	Instrument(s)	Scope	Metrics/5C Categories	Indicators	Type
Abundance / Sustainability	Organizational Sustainability Scorecard	Team Organization	Context Interface, Core Capacity (14 sustainability lines)	Lead + lag	Certified objective scorer + self-scored (tangible)
	City & Community Sustainability Scorecard	City/ Community Region	Context Interface, Core Capacity (14 sustainability lines)	Lead + lag	Certified objective scorer + self-scored (tangible)
Cultural Transformation Tools	Individual Values Assessment	Individual	Core Capacity (values line), Character	Lead	Self-scored (intangible)
	Leadership Values Assessment	Individual	Core Capacity (values line), Character	Lead	Self-scored (intangible)

Model	Instrument(s)	Scope	Metrics/5C Categories	Indicators	Type
	Small Group Assessment	Team	Core Capacity (values line), Character	Lead	360 (intangible)
	Cultural Values Assessment	Organization Nation	Core Capacity (values line), Character	Lead	360 (intangible)
Developmental Model of Intercultural Sensitivity (DMIS)—by M. Bennett	Intercultural Developmental Inventory (IDI)	Individual	Core Capacity (intercultural line)	Lead	Self-scored (intangible)
Constructive Developmental Framework	Developmental Assessment (Cognitive + Emotional/Social + Need/Press)	Individual	Core Capacity (whole + emotional & social lines), some Consciousness, some Context Interface	Lead	Certified objective scorer (intangible)
Ego Development	SCTi/MAP	Individual	Core Capacity (whole)	Lead	Certified objective scorer (intangible)
Leadership Capacity	360 CAP	Individual	Competencies, some Core Capacity	Lead + lag	360: Self +4-10 (intangible + tangible)
	Leadership Interview	Individual	Core Capacity (whole), some Competencies	Lead	Certified objective scorer (intangible)
	Leadership Questionnaire	Individual	Core Capacity (whole), some Competencies	Lead	Certified objective scorer (intangible)
	Leader Profile	Individual	Competencies, Core Capacity (whole), some Consciousness, some Context Interface	Lead + lag	Certified objective scorer + 360 CAP results (tangible + intangible)
	Team 360 CAP	Team	Competencies, some Core Capacity	Lead + lag	360 (intangible + tangible)
Leadership Development Framework	Leadership Development Profile	Individual	Core Capacity (whole)	Lead	Certified objective scorer (intangible)
Lectical Assessment System	LERA, LLRA, LDMA, LRJA, LSUA, LIMA, LMLA, LMSA	Individual	Core Capacity (cognitive line, other?)	Lead (lag?)	Certified objective scorer (intangible)?

Model	**Instrument(s)**	**Scope**	**Metrics/5C Categories**	**Indicators**	**Type**
Requisite Organization (including Complexity of Mental Processing—CMP)	Requisite Organization Platform by ROII. No instruments found by GO Society.	Organization (Jacques' original work could also be used with Individuals)	Core Capacity (cognitive line, other?)	Lead (lag?)	Certified objective scorer (intangible)?
Spiral Dynamics	Values Test	Individual	Core Capacity (values line)	Lead	Self-scored (intangible)

Interkannections *is a team of change leaders committed to helping our clients evolve their organizations, leadership and talent in ways that sustain and create value economically, socially and eco-systemically at both the global level and the communities within which they operate. We do this by working with them to create a cultural and systemic tipping point of abundance where together we are able to continually improve performance and generate added value along a triple bottom line of prosperity, people and place for ourselves, our organizations, communities, cities and the ecosystems that sustain us. We do this to help meet the changing needs of our clients and communities in the 21st Century, and leave the world a better place for our children.*

Chad Stewart *is a Principal of Interkannections, Co-Director of Integral Japan, Director of the Assessment and Development Center at the Intercultural Communication Institute (ICI), Projects Director for Abound and Vice-Chair of the American Chamber of Commerce Japan's CSR Committee. Since 1995, he has created in-house Learning & Development (L&D) systems and led change management, leadership pipeline, and OD projects in multinational corporations that have saved clients hundreds of millions of dollars, created and saved international product lines, smoothed M&A transitions, transformed a "leaderless" division into the regional talent bank for a Fortune 100, and improved triple-bottom-line performance. He has also worked with cities and prefectures, SMEs, NPOs and the UNCRD, and has lectured at the Kyoto University MBA School. Chad holds a Master's Degree in Intercultural Relations from ICI and is certified in the MAP/Leadership Development Profile, Spiral Dynamics integral Levels 1 and 2, Cultural Training Tools, and other L&D and change management technologies. He works in English and Japanese.*

Zach Smith *is a Principal of Interkannections, Director of Abound (a sustainability leadership organization that works with organizations and cities) and Director of Eco Nikko (an organization focused on individual health and development through retreats in Nikko, Japan). With over 10 years experience in human and organization development, his areas of expertise* *include human resources strategy and management, learning program design and implementation, coaching, facilitation, whole systems change and sustainability. He works with Fortune 100 and 500 organizations across a wide range of industries including accounting, airline, automotive, banking and financial, food service, IT, management consulting, petroleum, pharmaceutical and retail as well as regionally based organizations and start-ups. Zach has provided sustainability workshops for Antioch University in the US from where he also received a Masters in Organization Development and Change. He works in English and Japanese.*

Dr. Norio Suzuki *is a Principal of Interkannections and Director of Integral Japan. He has over 10 years of experience in human psychology and development (assessment, consulting, coaching, and training) with Fortune 500 companies, NPOs, and individuals. A large part of this work is in developing Leadership Pipelines and conducting Executive Coaching and Leadership Assessments in corporations. Norio holds a Ph.D. in Humanities from the California Institute of Integral Studies (CIIS), and is certified in Susann Cook-Greuter's MAP/Leadership Development Framework and Profile, Spiral Dynamics integral Levels 1 and 2, and Harvard's Negotiations for Strategic Success. He also led the CIIS community that used the Subject/Object Interview while acquiring his Ph.D., and is the official translator of the book "Integral Life Practice" into Japanese. He works in Japanese and English.*

Intuiting the Cognitive Line in Developmental Assessment: Do Heart and Ego Develop Through Hierarchical Integration?

Tom Murray

Introduction

Numerous times in voice and in print I have heard people question whether Dawson and Stein's work using the Lectical Assessment System (LAS), and whether other developmental instruments, are only focused on the "cognitive line," as opposed to other instruments that are somehow broader. Stein has tried to clarify his perspective on this question in (Stein & Heikkinen, 2008), but the question seems far from settled. The issue came up again in the "meeting of developmentalists" hosted by Bill Torbert on October 3, 2009, which is reported on elsewhere in this issue(personal communication with Bill Torbert; I was not in attendance). Dialog about this issue seems confused by an assortment of assumptions, and the question itself of whether certain instruments measure only “the cognitive line” includes too many assumptions to allow for resolution without a deeper exploration of these assumptions.

Inspired by Stein and Heikkinen's (2009) paper in our last issue and the responses in this issue, I would like to take the opportunity to reflect on these assumptions, and on developmental assessment in general, with the hope that it will help in some small way to clarify or promote further dialog on the subject. As a Response essay, the arguments presented here are not backed up with numerous references to the literature that a scholarly article would be. My goal is not to enumerate, critique, or even adequately describe the assessment instruments currently in use in the community, nor is it to posit solutions to the complex problems of developmental assessment. My aim is to raise general questions, identify assumptions, and propose useful distinctions.

In particular, I take up several issues that I hope to be able to explore in more depth in a future academic article. First, I consider what it is that we are trying to measure in our assessments. Stein and Heikkinen (2008) approach this question productively from the perspective of the intuitive construct of “altitude,” but here I approach it from the perspective of intuitions about wisdom.[1] Wisdom intuitively includes development of heart, soul, and ego, in addition to cognition. Second, I explore various definitions of "the cognitive line" and suggest that we keep in mind the limitations of even supposing that we can cleanly identify precise developmental lines independent of pre-defined tasks. I explore what we might actually be concerned with underneath the question of "is an assessment limited to the cognitive line"? Third, I discuss the limitations of models and relate that to hierarchically structured formal developmental models. Constructs such as reflective abstraction, hierarchical integration, subject-object transformations,

---

[1] I am of course not alone in taking up the topic of development by referring to wisdom. For example see Cook-Greuter (2002).

SOME RIGHTS RESERVED

and hierarchical complexity assume a particular (different, but similar for my purposes) "mathematics" of developmental growth.

Fourth, I ask whether the development of heart, soul, and/or ego might follow a type of mathematics (geometry or logic) that is different than that captured by existing formal theories of hierarchy. Finally, I question whether, until we have better theoretical and formal models, we might have to rely heavily on human gestalt capacities to recognize some aspects of the development of wisdom.

Development as Wisdom

As noted by Stein, Dawson, Cook-Greuter, O'Fallon, and many other developmentalists, development (and in particular so-called vertical development) is a construct that first and foremost points to a vague but definite shared intuition that people have about increasing adequacy and capacity to act skillfully in life situations.[2] Human development and learning happens in countless ways in response to countless life-based task demands, but within the field of adult development, and especially within the integral community, the kinds of development we tend to be interested in are captured by the concept of *wisdom*. In the domains we look at, including leadership, parenting, communication, collaboration, spiritual work, counseling, and teaching, our intuitions of higher stages of development correspond closely with our concept of wisdom.[3] The skills of ego-awareness (or ego development), construct-awareness (related to Basseches' (1984) dialectical intelligence), systems- or big-picture thinking, and social/emotional intelligence are all (and *together*) directly implicated (even synonymous with) modern day intuitions about wisdom. The usefulness of the construct of wisdom for the purpose of this essay is that it speaks to the strong interrelatedness of the various developmental lines that, in order to further our inquiry and understanding, we must also speak of separately. But these separate lines are somewhat arbitrary.

And along similar lines of reasoning, the developmental assessment instruments being used within the integral community (applied to leadership, coaching, communication, education, personal growth, civic engagement, etc.) can be seen as triangulating various aspects of wisdom.

---

[2] Cook-Greuter and Dawson both use an informal card-sorting activity to illustrate developmental intuitions. The audience (usually working in small groups) is asked to sequence a set of statements about a topic such as leadership or the good life. Invariably, on average people have surprising agreement about the hierarchical sequencing of the statements, pointing to a shared intuition. This is the core of Habermas' concept of *rational reconstruction*, or reconstructive science, in which the role of philosophy is seen as exposing the conditions and structures behind common intuitive constructs that are unconsciously or unreflectively used; and then to inform how inquiry in the empirical sciences is framed and conducted. Thus for constructs such as human development, freedom, respect, sincerity, and truth, the philosopher’s role is to explore what is always already at their core, as they are actually used and experienced, rather than to uncover some platonic truth or reality about their nature.

[3] We can note that what counts for a wise action or a person one admires as wise depends upon one's developmental level, yet, as with other developmental phenomena, though one can't easily "see" phenomena at levels higher than one's own level in a particular skill domain, developmental growth trajectories can be empirically demonstrated.

Though some of the frameworks, especially those looking at deep structure, are applicable across many domains, I am interested here in the life/relationships/work domains mentioned above.

What is the Cognitive Line?

Is the LAS, or any other instrument, confined to measuring "the cognitive line?" First, we should understand that the “cognitive line” is a man made construct that correlates with and helps categorize certain types of behavior and mental processes, but does not represent any known distinct component or function in the brain (or mind/body).

Kurt Fischer's (1980) Skill Theory supports the assertion that the act of differentiating complex human capacities into separate skills or lines is largely artificial. Fischer claims that skills develop in response to the demands of real life task situations: "the skill level that a person displays…cannot be considered independently of the context in which that skill is assessed."[4] Some primitive human skills such as those dealing with reproduction, eating, and territory, seem to operate fairly *independently* because the task situations or life-needs they address are relatively independent. But the complex human social contexts of communication, decision making, and knowledge building have massively overlapping characteristics such that the skills developed to meet these needs should be expected to be equally *interdependent* and difficult to separate. Tobert and Livne-Tarandach (this issue) also describe evidence that as skills become more complex (i.e., at higher developmental levels) they become more entangled.

Often, measuring development involves creating tasks for people to do (e.g., respond to open-ended interview questions or sentence completions). These tasks are designed explicitly to be able to reveal developmental differences, so from the start they are based on some theory of development. In a sense the task itself defines a pseudo-line of development. This is not to say that the tests currently being used are not relevant to the real life skills we are concerned about (see Torbert & Livne-Tarandach for correlations with authentic outcomes). The point is that artificial tasks such as answering interview or assessment questions define their own quasi-artificial lines of development that seem distinct because the task is well-defined.[5]

Since an objective "cognitive line" function of the mind is not seen as an ontological reality, the question of "what is cognitive" reduces to what do we mean by cognitive in this context. It is beyond my scope here to explore the possible senses of the word, but we can pilot around the word to get a sense of what people are really pointing to when they refer to "the cognitive line." *Cognitive* can refer to the information processing part of the mind/body; to simply what we are aware of (in the conceptual and developmental sense) such that we can even think about it (process information about it); to the logical rational functions of thought closely related to the classic notion of "intelligence" (IQ), and to the aspect of thought that is interested in determining what is true about the objective world (for physical-plane survival and “thrival”).

---

[4] Fischer & Farrar, 1987, Page 647.

[5] As is always the case in measurement, there are tradeoffs between authenticity (ecological or external validity) and reliability (or internal validity). That is, to the extent that the task is similar to an authentic real life action situation, like participating in a job interview, the "line" that the task defines is more relevant to wisdom skills. Yet more authentic tasks are complex and may be difficult to measure and interpret. So it is more prevalent to use artificial tasks such as answering questions on a form or in a structured interview, which are easier to score, and also define "cleaner" lines, but these lines are less guaranteed to relate to real life. The artificiality of tasks varies among the currently used assessment instruments, and some methods do not involve “lines” at all. Also, in commercial (non academic) settings, the cost of coding or assessing authentic tasks can be prohibitive—another tradeoff.

The question of what is cognitive can also be illuminated by looking at its complement—when we categorize something as cognitive we are categorizing other things as non-cognitive. This brings us to the related question that inevitably comes up about the limits of assessing exclusively language-based performances. When we say "cognitive" in the context of our focal question, we are pointing to that which we know explicitly and can speak about. So underlying questions about the limitations of cognitively-oriented or language-oriented assessments are likely to be concerns about activity in the following categories.[6]

1. *Action*. Human development might be best measured according to what we *do* and *can* do, rather than what we say, or what we think we can do. Assessment questions that ask one to reflect on oneself (which statement is most like you; do you agree with the following…; are/do you….) are clearly limited by self-knowledge and what one wished one was like. And even for accurate assessments of self, there can be large performance-competence gaps and context dependencies that lead to an unintentional focus on ideal situations.

2. *Language skill*. We must ask whether we are in part measuring the ability to express oneself in language. Some of those we see as wise are rather quiet, speak in simple terms, or speak through action and non-reaction. And yet, if we evaluated how they responded to complex social, or interpersonal situations we might infer that choosing the one action among the infinite possible actions required a developmentally sophisticated understanding of the complexities, nuances, and dimensional levels of the situation. Perhaps a focus on speech-acts limits our exploration of wisdom (and related developmental lines) to those who are acculturated to be like us, who travel in academic (or organizational development, or upper middle class, or male-dominated, etc.) circles, and like to read and write and argue about their passions. Then again, communication is an action and skill in itself, as well as a medium, and certain aspects of what I am calling wisdom skills relate directly to communication skill.

3. *The non-conscious*. By far the bulk of who we are and what we do arises from non-conscious processes, including both repressed information in the Freudian sense, collective or archetypal patterning in the Jungian sense, social and historical conditioning, and the sorts of pre-conscious automatic processes that cognitive psychologists study (and described in Gladwell's *Blink*). These deep processes are mostly beyond our awareness and reflection, though they are evidenced in action, speech acts, and the conscious content of private thought processes.[7]

---

[6] These questions are being addressed in the literature in various ways; I am not by any means the first to pose them, my goal is to summarize the main themes.

[7] Note that if our goal is to reflect upon and improve or transform human behaviors can capacities, then we must make efforts to expose and describe what is tacit, both to be able to reflect upon it, and to design educational/transformational tools.

4. *The non- or post-rational*. The wisdom-skills of life are clearly about more than logical rational thought or linguistic competence. Adult developmental research is illuminating post-rational forms of thought that understand the strengths and weaknesses of both logical/rational/categorical thought and non-rational modes (e.g., emotional and intuitive forms), and produce post-rational decisions about when and how to use these different modes. Though post-rational thought can be seen as imminently rational, the question remains as to whether combinatorial and integrative models can formally represent types of understanding that reflect upon what is unknown or paradoxical, or chaotic.[8]

The above does not answer the question of whether the LAS or any instrument is limited to the cognitive line, but provides some concepts to help clarify the question itself and perhaps to ask more productive questions.

Deep Structure and Hierarchical Development

The LAS, developed by Dawson, combines aspects of the Hierarchical Complexity Scoring System (developed by Commons and colleagues) and Skill Theory (developed by Kurt Fischer), which are both early members of the neo-Piagetian generation, building on Piaget's (2001) theory of reflective abstraction. Dawson was a primary student and co-researcher with both of these leading figures in adult development. All three of these systems are based on content-free developmental models that look (and make assumptions about) the deep structure of development, rather than surface elements.[9] A formal structural model is like a mathematics—like a type of logic or geometry, a formal system for representing how elements are combined and how new elements and patterns emerge from their combination and/or interaction.

Such formal systems representing growth, development, or learning use a variety of operators, including integration and differentiation, abstracting or generalizing common properties, and the coordination of lower schema. As one sees in all formal systems (including simple algebra and geometry and more elaborate systems in chaos and systems theory) very complex multi-layered structures can be built up from a few simple operators acting recursively. Also, since higher level schema are seen as single units abstracting or coordinating lower level ones, there can be a type of simplicity emerging from complexity as complexly-related units organize (or reorganize) into new wholes through successive differentiation and integration.[10]

---

[8] Dawson (personal communication) argues that much of the territory of post-rational and non-rational reasoning can indeed be examined using hierarchical complexity: "The research clearly suggests that HC explains a great deal of what is going on here… One way to figure out what is NOT explained by HC is to parse out the HC dimension of performance. For that, you need a good HC ruler that goes straight to the core of HC… Once you have accounted for HC, then you can examine what's left—we find biases & preferences, temperament, affect, and dispositions when we do this exercise."

[9] The constructs of surface vs. deep are relative, and most developmental models claim to deal with elements that are deep and not on the surface, but the projects mentioned go the furthest in being based on deeper structures.

[10] Neurons seem to build structure upon structure in a way that could explain reflective abstraction (or hierarchical integration, subject-object transformations, etc.), or at least act as a metaphorical bridge. Developing the ability to be aware of and reflect upon—or combine and coordinate, or generalize or

The exact structures, logic, or geometry of such theories does not matter for my purposes here. What does matter is that such theories explain development of all types, including the development of physical skills, communication skills, self-knowledge, social skills, linguistic skills, intellectual skills, domain-specific knowledge, through the lens of such formal models. Not only cognitive skills, but sensory-motor and social skills such as playing tennis or leading teams, and even the behavior of non-human animals, can be modeled using such processes. Such deep-structure theories can rightfully say that that they are not limited to the cognitive, or any other line, or to linguistic behavior, in their most general form (i.e., as domain independent theories).

On the Limits of Models and Formal Systems

Next I would like to move into questions about the limitations that formal models, and all models, possess, as another way to approach questions that come up about various developmental models and assessment tools. I want to ask how explicit we can be about the limitations of our tools, both conceptual (as in models) and instrumental (as in metrics and assessment instruments). As those familiar with my writings on integral themes may know, I have a fascination with the limits of knowledge and thought, and touch on themes of indeterminacy (including uncertainty, ambiguity, and paradox) in most of my articles.[11] A minor concern is with the epistemic or ontological humility of acknowledging that a particular claim, model, theory, concept, or method has indeterminacies or limitations. We do often see this sort of humility in scholarly works. But what is of most interest are the possibilities that become available when we study the indeterminacies and limitations enough to be able to characterize them and to explicitly work *with* uncertainty, not just *within* it.

This is just the sort of thing that error bars or confidence intervals do in statistics. Statistics has studied the nature of uncertainty to a point where, along with the main truth claims made from data, we can also make definitive claims about the *limitations* of the main claim.[12] Statistics does this from a right-hand-side perspective (being about measurable objective realities), and what I am interested in (and I must admit that I am an amateur in this area, which goes deeply into psychological and philosophical territory) is taking this approach into the left-hand or interior realms—the realm of concepts, language, beliefs, models, and theories.[13]

---

abstract—existing cognitive content, is easily pictured as adding a new layer of neurons or connections that sense, measure, react to, coordinate or regulate a prior or "lower" layer.

[11] I spent decades working in areas of applied artificial intelligence where I was exposed to many theories of formalizing human knowledge, skill, and behavior; and to the progression of academic expectations in these areas as scholars became ever more aware of the true complexities of human behavior (and living systems in general, including animal behavior and social systems). This, in addition to my own work in "knowledge representation" and "knowledge acquisition," plus studies in psychology and philosophy, have made me acutely aware (overly sensitive?!) of the limitations in our attempts to formalize complex natural systems.

[12] Of course, there are uncertainties in our claims about statistical uncertainty, and the issue is recursive in a never-ending way. But just going this one level deeper provides significant value (going two or three levels deeper becomes so difficult to conceptualize that there are diminishing returns).

[13] Lakoff and Johnson (1999) maintain that the constructs available to us from which to build our models (abstract concepts, structures, operators, etc.) are deeply metaphorical. These metaphorical building

That is, we know that conceptual categories and the models and theories that are build from them inevitably have fuzzy boundaries and diverse interpretations, and we know that our perceptions, abstractions, and generalizations are limited by various sorts of biases and distortions; lenses and filters. But we often share claims as if we did not know about these limitations. Indeed, in abstract (conceptual and non-measurable) domains it is not an easy thing to do—it takes tools we are historically just beginning to become acquainted with and effort that is in short supply to step back and evaluate the limits of one's claims with any sort of rigor. And the norms of modern scholarly discourse give little incentive to do so. But I propose that as we become more comfortable and familiar with the *nature* of various sorts of indeterminacy (including what Fisher and Stein (2008) have called "dark knowledge"), through findings in psychology and philosophy, and increase our familiarity with this terrain, we can expand meaning-generation potential and efficiency in a community of inquiry.

This allows for more nuanced dialog. For example, the concepts of mind and consciousness are quite problematic in their definition, yielding various types of arguments about their nature which are highly fallible and vulnerable to counterargument. Perusing the debated claims and counterclaims in the literature is dizzying. From the perspective of am interested reader not attached to a particular answer (i.e., myself) it seems as though so much ink is wasted when authors hold onto a particular definition and do not yield to the possibility of alternate perspectives.[14] Another example is in the use of theoretical models such as AQAL.

As Wilber is quick to note, AQAL is a map and not the territory itself—it is a particular way of cutting up the infinitely complex, nuanced, and ineffable territory(s) of reality, useful for a particular set of purposes. This noting constitutes the type of humility I mentioned above. But the next step, not so often taken, is to say as much as one can about the nature of this way of slicing up the "pie" such that we can understand the limitations of this powerful conceptual tool. What does it assume that might not be true? What admits to alternative views? What types of phenomena are not adequately captured using this lens? What things fall into the fuzzy or gray areas between the crisp conceptual lines of the four quadrants (and the other categories such as states vs. stages)? My argument is that all models and theories would be more adequate if they were described and "delivered" with a meta-wrapper or boundary analysis explaining some of what is known about the limitations of the "map."

How does this relate to our current topic of developmental assessment? Developmental assessments, if approached from the perspective of pure metrics, are subject to uncertainties akin to the right-hand-side realm of statistics, and their indeterminacy is thus more understood and less problematic. But to relate a pure metric to anything of relevance, to say what its results *mean,* we rely on models (or other tools of interpretation).[15] So we are back to the limitations of models.

---

blocks are both tools and lenses that reflect the sensory-motor (and other) primitive elements of our experience, as much as they reflect truths about the world.

[14] For example, rather than "you are wrong" the dialog becomes more like "if one interprets the concepts [e.g., consciousness] in […this…] way there is validity to what you say, but my focus leads me to interpret it [consciousness] in […this…] way, which I claim is more useful."

[15] Also, assessments are designed in the first place to serve the needs of a model or theory, so reevaluation of the nature of a model may lead to reevaluation of the nature of a related metric.

The models being developed using constructs such as hierarchical complexity and hierarchical integration are proving to be extremely powerful in uncovering deep structure, and helping explain and perhaps even predict developmental phenomena. This is in part due to their additional levels of formality. Increasing theoretical formality involves, among other things, making sharper conceptual cuts in the fabric of observed reality. The benefits of doing so are clear, as can be seen in the contributions of modern science and technology. However, in this post (or post-post) modern era, we are also increasingly aware of the limitations of formal systems to capture truths about reality. And, importantly, are beginning to become aware of the shape of or *nature of* these limitations (as in the uncertainty principle and Gödel's incompleteness theorem), in such a way that we can work *with* the uncertainty, not just be helplessly subject to it.[16]

Though I have some incompletely-worked-out ideas about what this might look like, for this informal article I will simply suggestion that we put more effort into such "boundary analysis" as a way to compare, contrast, and combine the best of the current developmental models and assessment methods. Also, I should note that, though each formal model has its limitations, particular practitioners or projects sometimes use a combination of tools, each of which may compensate for the limitations of the others. For example, Dawson's (Dawson & Stein, 2008) "developmental maieutics" is about embracing multiple approaches.

The Landscape of Assessment Tools

Up to here my discussion has brought together ideas seen elsewhere in an attempt to help clarify and promote dialog and meta-reflection on the practices of making and using developmental models and instruments. Next I will slip into much more speculative territory, with the hopes that my intuitions and musings will lead to productive dialog rather than simply expose the limits of my experience in this domain (!).

The current landscape of developmental tools includes those that seem to have had very little if any assessment of validity,[17] those, such as Cook-Greuter's and Torbert's LDP-related instruments, that have shown some validity (but perhaps do not raise to the standard of calibrated measures, as called for by Stein and Heikkinen), and those, including the LAS, that have shown strong (calibrated) validity and are also based on a deep/formal developmental theory. It is the latter two categories that I am concerned with here.

---

[16] Of course, within the power of this new type of knowledge we are best maintain humility, as the recursive questions about indeterminacy have never ending depth.

[17] These include many that are used in leadership and organizational development, too numerous to list here or single any out (but see Stein and Heikkinen's article in IR's prior issue). Presumably those using them believe that the value added in terms of generating meaning for clients outweighs the problems inherent in their lack of validity. I am very sympathetic with the cautions brought out by Stein and Heikkinen (prior issue), but hold out the possibility that in some cases soft metrics can be used in such a way that there is overall value added, for example in guided self-evaluation (and see the discussion of first, second and third person methods in Torbert, this issue). I am also sympathetic to the pragmatic reality that if an organization has found benefit for self and client in a "tried-and-true" instrument, there may be little incentive, nor even the realistic possibility, for them to fund the type of large scale research project needed to sufficiently validate the instrument. The potential to harm clients is very real and must be looked at squarely in each case. But it would be an overstatement to say that all non-validated instruments are harmful.

My understanding is that Stein and Heikkinen (and others in the neo-Piagetian line) hypothesize that their formal frameworks could measure much of what the LDP and related frameworks are measuring, and do so in a more rigorous fashion; and that some of those using LDP-related tools believe that they are able to assess something that the more formal models do not (or cannot). Both "camps" if I can call them such, agree that the ultimate answer to these questions will come only through empirical work in comparing the systems (as Heikkinen (this issue) is doing now between the LAS and Kegan's SOI instrument). Such comparisons will be important and revealing, and I hope that resources become available to facilitate this happening.

In the meantime, I will speculate that it *may* be possible that the less formal frameworks may be looking at a wider range of phenomena than the LAS (paired with a developmental model) can easily accommodate (a counter argument would be that multiple domain-implementations of the LAS could cover the same territory—see footnote 5). There is often a tradeoff in assessment between rigor (precision, internal validity) and scope and real-life relevance (including ecological validity). This may or may not pertain to the differences in these methods, as future analysis will reveal.

The above discussion has laid groundwork for me to bring forth a question of whether assessments relevant to matters of heart, spirit, self, and relationship might have a different underlying structure or mode of development that is not captured by current hierarchical theories or assessment tools.

The Geometry of Growth of Compassion and Negative Capability

Consider again some common intuitions about the development of wisdom. Think about wise people and wise actions, and what it takes for any one of us to grow in wisdom. In addition to the accumulation of complexity and the concurrent simplicity that comes from combining elements into new wholes, there are elements of un-learning (subtracting), of letting go and emptying, and of opening. Some would say that the wise heart is spacious and non-attached. What kind of structural transformation does it take to achieve this type of skill? It may need to be explained with something other than hierarchical processes.[18]

Imagine a conversation with someone who you know to be quite intelligent but in this context is just not able to release his grip on a belief, or is not able to see a part of himself that all of his friends see clear as day and have been gently trying to point out, but he struggles with internal resistance. There is an insight available to him about himself, about others, or about life, that he will surely grasp as soon as he lets go. He has shown in other situations that he is capable of stepping back and reflecting upon himself, of seeing the larger picture, the complexities and nuances. He has already developed the capacity to do these things, so what is called for is not so much a building up but a letting go, a type of healing, or a moment of grace. The article by Sofia

---

[18] Ross (personal communication) says that hierarchical models can in fact account for these types of phenomena. The issue may come down not to the limitations of models, but current limitations in the assessment tools, metrics, and observable tasks that we use in conjunction with our models.

Kjellström in this issue talks about Kegan & Lahey's Immunity to Change Process, which directly highlights the fact that the release of resistance, unconscious motives, and psychological "baggage" may be as strong a determinant of the speed of developmental growth in adults as the gradual processes of hierarchical and additive growth.

Or imagine the proverbial seeker who goes into a guided contemplative seclusion and emerges with a new radiance and lightness (and, yes, in this imaginary case, *can* hold onto these qualities when she descends the mountain and enters the "market place"). Take a moment to feel what it feels like to be in a place of compassion with others. To develop in compassion is to very literally feel a sensation of expansion or lightness within the heart-space. Growth in heart and spirit reveal a phenomenologically different space than cognitive growth, and it seems possible that the structural transformations happening inside the body (or body/mind/soul) happens according to a different type of mathematics or logic or geometry.[19] It may be possible that this type of change calls for different mechanisms and metaphors than are currently employed by hierarchical models.

Another element of the growth of wisdom is our ability to deal with dissonance, uncertainty, ambiguity, and paradox. Such dialectical intelligence (see Basseches contribution in this issue), vision logic, or "negative capability" may also imply a different set of metaphors and formal operators than we are currently using. Though, this type of growth is much closer to the domains that hierarchical methods have been used to explore.

Intuition vs. Formality in Assessment Methods

Another issue brought up in comparing developmental assessment methods used in the integral community is the more holistic and hands-on process used by those who use scoring rubrics vs. the more formal methods used with the LAS. Does the subjective role or innate intelligence of the human rater have a positive or negative effect on validity and usefulness? The LAS method purports to be more rigorous in that it uses a more formal approach to skill representation, requires less subjective interpretation, and has less reliance on surface meaning than other methods. This would indicate that it may be more reliable in measuring the aspects of wisdom-skill that are structured according to hierarchical models. It also indicates that the LAS is stronger for measuring specific well-defined lines.

However, above I ask whether there are important elements of wisdom that are not so structured; that are structured in ways that we do not yet have adequate conceptual tools (concepts or metaphors) to formally represent. To the extent that we lack the formal tools to represent these aspects of development, we may need to rely more on human gestalt reasoning, which can recognize more complex or subtle patterns than current mathematical and computational tools can assess.[20]

---

[19] See the "The Coherent Heart" by McCraty et al. in this issue for research on the neurophysiology of the heart.

[20] My own work in artificial intelligence (backed up by many scholarly sources) has made me aware that in certain pattern recognition tasks the human mind far exceeds what we have been able to do with machines and formal algorithms (and vice versa, computers are better at some things).

The LDP-like tools used by Cook-Greuter and Torbert are sometimes said to measure the "ego development" line, but are actually measuring some combination of three or more quasi-lines (behavioral, cognitive, and affective-relational).[21] Thus they are assessing some of the wisdom skills that I argue may have elements that do not develop according to hierarchical logics. It is possible that human gestalt capacities can evaluate development in these areas better than the more formal systems, given our current state of the art. The LAS is designed to measure one developmental "line" at a time, as opposed to the more holistic combination of quasi-lines assessed in the LDP. The LAS may not be able to assess certain aspects of wisdom that a more holistic method could. However, it should prove to be more rigorous at assessing the lines that it can measure.

Dawson's approach to developmental maieutics is not limited to the LAS. Importantly, the LAS can be used to measure the aspects of development that do grow through hierarchical complexity, and can thus reveal the outline of what remains with particular clarity (see footnote 8). And what remains can be analyzed using different methods.

Conclusions

Constructs such as reflective abstraction and hierarchical integration point to deep structural properties of learned behavior that have proven to be extremely useful for understanding human (and animal) learning of many types. I have focused on a particular set of human capacities that seem highly valued in the integral community—framed under the umbrella of wisdom skills. These include what has been called ego awareness, construct awareness, socio-emotional-relational skills, dialectical intelligence, negative capability, empathy, and compassion.

There is no doubt that much of what we observe as development in these skills can be described in terms of formal hierarchical models. It is also possible that growth in wisdom (not simply individual differences, but growth or transformation) in these ways can *not* be adequately described using current hierarchical models, and that this possibility is what is being referred to when people ask about whether certain assessments are too limited to the cognitive line. Alternative and complementary models or modes may need to be developed. In particular we may need to more fully articulate models that account for aspects of wisdom growth that involve letting go, unlearning, healing, or non-hierarchical expansion or enfoldment. I also suggest that, at the least, we would benefit from putting more effort into articulating the boundary conditions and indeterminacies of the models in use.

Educational Crises and the Scramble for Usable Knowledge

Zachary Stein

Abstract: Quality-control efforts in the field of applied developmental psychology are just beginning. In this paper I set these efforts in a larger context to frame their significance and guide their direction. I argue that the challenges arising in the current post-national constellation are best understood as educational crises. The task demands of the global problem space increasingly outstrip available human capabilities. This situation is leading to a scramble for usable knowledge about education—defined broadly as any process intentionally undertaken to promote human development. There is a growing demand for techniques and technologies that catalyze the transformation of human capabilities; and this demand exceeds available supplies. Education becomes a growth market as specific types of human capabilities come to be recognized as scarce but valuable resources. This pressing global demand for innovative educational solutions and approaches has the potential to systematically distort the production of relevant usable knowledge. I present a set of general quality-control challenges that face the field of applied developmental psychology as it strives to meet the demands of a globalized crisis-ridden educational marketplace. I argue that the field should overcome temptations to circumvent peer review processes by going directly to consumers. I suggest adopting a general stance of *epistemic humility* so that research and collaboration are promoted and argumentative strategies that insulate approaches from criticism are avoided. Finally, I argue that more careful attention should be paid to the normative dimensions of educational enterprises, as they involve the creation of new values and raise ethical questions about the shape of what life ought to be like.

Keywords: developmental psychology, education, post-modern global society, quality control, usable knowledge.

We Developmentalists

This paper is the third in a series of publications about applied developmental psychology (Stein, 2008; Stein & Heikkinen, 2009). In these publications my broad goal has been to start a serious discussion about the proper and improper uses of developmental metrics and models. Along the way I have had the good fortune to participate in exchanges about these issues with some of the greats, including: Ken Wilber, Susanne Cook-Greuter, Bill Torbert, Bob Kegan, Howard Gardner, Kurt Fischer, Michael Commons, and Theo Dawson. Now, with this special section in *Integral Review* my network of interlocutors has expanded once again. The responses to my efforts have made it clear to me that the quality control issues I have raised are important to many thoughtful people. Moreover, the tone of the discourse has made it clear to me that these are domestic disputes. We developmentalists are on the same team and want to find ways to work together to insure the knowledge we have gained gets put to use as ethically and efficaciously as possible. However, as I explain below, we need more than good intentions.

SOME RIGHTS RESERVED

In his brief but insightful counterpoint Basseches (this issue) raises the specter of a “tyranny of measures” — a socio-political situation wherein psychological measures supplant respectful discourse and enable forms of institutionalized domination. I think that there is good reason to fear this as a possible future. As I have stated elsewhere (Stein, Dawson, & Fischer, in press) the majority of post-industrial societies have large educational systems dominated by complex standardized testing infrastructures. In some contexts the situation already resembles a kind of “tyranny of measures,” where psychological measures alone determine the distribution of opportunities and rewards. At least since the publication of *The Tyranny of Testing* (Hoffman, 1962) many have leveled broad and incisive criticisms of the testing industry. But, despite clear evidence that the approach is flawed (e.g., National Research Council, 2001) there is continual political push towards expanding the existing testing infrastructure. These expansions will inevitably infiltrate higher education and human resource management in business and government.

It is clear to me that the push to expand testing infrastructures should be seen as an errant response to profound challenges that face large sectors of society. Below I argue that the current post-national constellation faces endemic *educational crises* (see Figure 1), wherein the problems we need to solve outstrip our capabilities. Thus, echoing Habermas (1984; 1987) and Wilber (1995), I argue that viable solutions must entail the promotion of *learning processes*. We must find ways to foster the development of individuals who are *capable* of navigating the complexity of this historical moment. The ever-expanding testing industry is one face of current technocratic responses to this problem. The other face is an ever-expanding branch of the biomedical technologies industry that focuses on the “enhancement” of psychological functioning (see, Stein, della Chiesa, Hinton, & Fischer, in press). There is a pressing need for usable knowledge about how to affect the transformation of human capabilities and a sprawling set of markets is springing up around this need. If market mechanisms dominate the available supply of educational options, we may face not just the tyranny of a standardized testing industrial complex but also a brave new world characterized by large-scale strategic alterations of the human nervous system.

It is my hope that we developmentalists might be in a position to affect the trajectory of our society‘s response to the educational crises it faces. This includes shaping the future of institutionalized applications of psychological measurement. It also involves engaging in research about how development is best fostered. And, I think, we also need to weigh in on the normative and philosophical issues at the heart of human development, clarifying which potentials are preferable and ethically vetting the means we are willing to employ to achieve them. But the complex context in which we make our efforts works against us.

Below, after clarifying the nature of the educational crises that constitute this context I discuss characteristics of our current knowledge production processes that might undermine our best intentions.

Educational Frontiers and Educational Crises

It has been suggested that with the closing of the American West early in the 20th Century education became the new frontier. Education came to be invested with the ameliorative and utopian (and opportunistic and exploitative) energies that once characterized westward expansion (Karier, 1986). During the 19th Century the West exemplified the possibilities of American democracy. Its vast expanses and resources were understood as indispensable enablers of America's future as a land of opportunity, freedom, and equality. The "problems" of immigration and labor, of urban crime and poverty, of anomie and economic stagnation—these could all be solved by heading west, it was said, where the future of America was being forged, where everyone looked out toward an open horizon. Since the early 20th Century, so the argument goes, these same ideals and energies have been tied to the possibilities of education. Just as the West was once thought to make all things possible, so now education is saddled with the burdens of accomplishing democracy.

This is an important insight and one that is more significant today than when it was first expressed in the 1960s. But today an argument about the function of education needs to be more than a story about American nation building. It needs to shed light on the current post-national constellation. Familiar ideals—birthed in both Athens and Jerusalem—have catalyzed the global expansion of certain techno-economic conditions and moral-political orientations. The rule of law and democratic governance processes increasingly characterize societies worldwide. These are social changes typically accompanied by free market capitalism and industries built around scientific and technological innovation. As diverse and geographically distant markets and cultures have become irreversibly interconnected through increasingly complex communication networks, the most advanced nations in the world have come to share a common historical trajectory. Since the end of colonialism and the failure of the Soviet experiment there remain no alternatives to the dominant modes of political and economic organization (Habermas, 2001). This is just to say that major shifts in the trajectory of the total system, such as those needed to handle climate change and terrorism, are now possible only from within. In the context of this need for immanent self-transformation, it is education that saddles the burdens of accomplishing a just and sustainable global civilization. The educational frontier is trans-national.

Importantly, *education*, as I use the term and its variants here, signifies more than what happens in schools. Following Dewey (1916), Cremin (1976), and Habermas (1984; 1987), I think education is better understood as a broad socio-cultural function and form of human interaction. Dewey went so far as to say that all communication is educative, a view I have some sympathy with. But I will say instead that any intentional effort to promote human development is an educational effort. Or, put slightly differently, any initiative taken to affect a valued transformation of human capabilities is an educational initiative. So *schooling* is just one form of education—albeit a particularly important and powerful form. Coaching and psychotherapy would be educational initiatives according to this definition, as would professional development programs and most organizational consulting work. The publishing industry, television, film, and the Internet all have educational affordances and represent some of the most expansive possibilities on the current educational frontier.

So my argument is that education, thus broadly defined, serves a unique and powerful function in the emerging global civilization that surrounds us today. There are no major global challenges that do not have critical educational dimensions. Moreover, many key challenges are primarily educational in nature. This is just another way of saying that changing the trajectory of the total system requires changing how people think and act, which can only be done by finding ways to affect valued and needed transformations of human capabilities. Human development is the elephant in the room when it comes to calls for systems level change.

This line of thought suggests that the climate crisis is actually a crisis of human decision-making, and that educational initiatives are as (if not more) primary and important than legal and industrial ones. A new generation of "green" voters and engineers must be fostered through educational initiatives; leaders must likewise come to think and act in more sophisticated ways. If the task demands of building sustainable systems and lifestyles are more complex than the capabilities of those asked to do so (which I think is the case, in fact) then no matter how much funding we throw at achieving sustainability, our efforts will fail. Building a "smarter planet" through technology (*a la* IBM) and policy (*a la* Al Gore) is necessary, but smart people are a prerequisite. Wilber (1995) suggested as much over a decade ago when he noted that the greatest threat to the biosphere is not industrial pollutants but rather the current low developmental level of human capability with regards to relevant decision-making domains.

This reading of the climate crisis displays what is actually a general trend in contemporary society, one noted by Wilber (1995), Kegan (1994), Habermas (1975), and Jaques (1970; 1976), among others. This is a trend toward educational crises of increasing prevalence and intensity. Figure 1 displays the general structure of an educational crisis. The displayed mismatch between demands and capabilities is ubiquitous in the post-industrial world, characterizing both the struggles of individuals and broad societal trends.

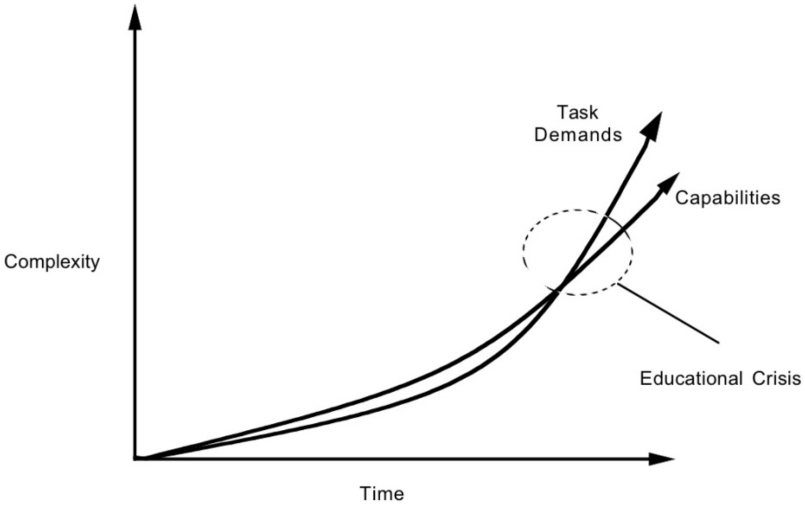

Figure 1: An educational crisis occurs when the complexity (diversity, quality) of task demands outstrips the available capabilities. This can happen to both individuals and societies. Based, with permission, on a comparable figure rendered by Carreira (2009).

The task demands of work and life outstrip individual capabilities on multiple fronts (Kegan, 1994). Rapid technology driven innovations and economic pressures shape the employment histories of individuals, disrupting stable patterns of competence and establishing the need for professional development and lifelong learning. Advances in biomedical technology and an increasingly unwieldy health care system put unprecedented decision-making demands on individuals and families, who must navigate ever shifting diagnostic categories, treatment options, and the complexity of the insurance industries. Communication technologies enable expansive social networking opportunities that radically alter socialization patterns and identity formation. The construction of a continuous and coherent life-project is more demanding then it has ever been (Beck, 2001; Arnett, 2004).

Broad social trends also reflect educational crises (Habermas, 1975; 2001). The latest economic crisis is a case in point. Like the climate crisis it is perhaps best read as a crisis of decision-making. Debates in economics and politics have taken an epistemological turn, as many have come to question our very *ability* to understanding the global economy at all. This suggests that the task-demands of regulating massive trans-national markets outstrip the capabilities of those who seek to do so. Other fronts present comparable educational challenges. Executing an ecologically responsible redesign of energy systems requires accomplishing feats of engineering that are stunning in their scope and complexity. Global terrorism is, when viewed along these lines, a significant educational issue. Terrorist networks are, in fact, remarkably effective educational organizations. And the difficulties of inter-religious and cross-cultural conflict mediation and dialogue are primarily educational. If the task of constructing a just and stable world order demands more from us than we are capable of, then we must change the nature of our capabilities.

So education is a growth market—from self-help books, life coaches, and online universities, to Ritalin, the blogosphere, and Google. Large swaths of society are groping for ways to cope with the mounting complexities of the historical moment. But the demand for effective educational interventions far exceeds the supply of approaches that have proven effective. For example, snake oil salesmen already successfully broker so-called “brain-based” educational approaches to unsuspecting parents and teachers, making outlandish scientific-sounding claims about their products’ effectiveness. The presumed educative benefit of emerging information technologies (e.g., the search-engine, Wiki, blog, or e-learning module) is questionable, given the sheer quantity, diversity, and ambiguous quality of the content. Informational environments are *not* always educational environments (although educational environments *are* always informational environments). Biomedical technologies built to improve attention, memory, or emotional self-regulation are likewise unreflectively endorsed as effective, while the impacts of long-term usage are totally unknown. Psychotherapy, executive coaching, and professional development programs of various shapes and sizes are proliferating and testing the limits of what the market will bear as far as what qualifies as a useful learning experience.

This is the context in which the field of applied developmental psychology finds itself. With over 100 years of cumulative theory and research—from Baldwin through Piaget and Kohlberg to Fischer, Kegan, and Wilber—the field is uniquely positioned to address the current need for broadly effective educational innovation. However, existing cultural trends and market dynamics work to counteract the value and validly of what the field has to offer. Basically, as was just suggested, because the need is so great, it is easy to sell just about anything. Moreover, powerful political and economic forces have shaped mainstream efforts toward the aforementioned technocratic solutions combining standardized testing with biomedical technologies. For the field of applied developmental psychology to gain traction we must respond to the demands of this globalized crisis-ridden educational marketplace with a unique and powerful *modus operandi*. My calls for quality control, and the ensuing discourse (in this journal and beyond), should be understood as attempts to articulate just what this might look like. The broad idea of an *Institute for Applied Developmental Theory* focusing on quality control and fostering collaboration—first articulated by Ross (2008) and echoed by Stein and Heikkinen (2009)—remains one of the best options. Below I continue to sketch the contours of preferable knowledge production processes with the hope of further helping knowledge workers in the field to build such a common mission and vision.

Building Useable Knowledge in a Time of Crisis

In prior publications I have noted the need for researchers and practitioners to hold developmental metrics to more rigorous psychometric standards (Stein, 2008; Stein & Heikkinen, 2009). This is a critical point for a variety of reasons, as Dawson's sketch of basic concepts in psychometrics elucidates (Dawson, this issue). Make no mistake, if we do not handle these foundational psychometric considerations we will remain on the sidelines as large human resource management agencies, test manufactures, and governments work to build educational infrastructures around approaches that can (ostensibly) prove the scientific-quantitative validity and reliability of their instruments. Importantly, quantitative and qualitative methods are not mutually exclusive; both can be transcended and included in more comprehensive and rigorous approaches to psychological research (Habermas, 1988; Dawson, Fischer, & Stein, 2006). The pursuit of psychometric rigor is *not* in conflict with the goal of "disclosing interiors" or providing rich, broad, and useful descriptions of psychological phenomena. But the explicit pursuit of psychometric rigor *is* a necessary but not sufficient component of any approach that aims to have an impact on current trends toward the large-scale institutionalization of psychological measurement. If we opt out of this task we will be relegated to the fringes, unable to address the arguments of those espousing more overtly reductionist-technocratic approaches. So the call for psychometric rigor is critical.

But we have more than psychometrics to worry about. There are a host of other issues with the potential to undermine our efforts at collaboratively building usable knowledge in this time of educational crises. Here I select three such issues and briefly elaborate what is at stake. These issues reflect my experiences with the current discourse. They should be taken as part of the collective ongoing efforts to outline best practices for developmentalists exemplified by this issue of *Integral Review*.

In general, the interface of academic research and real world application is a dynamic and difficult place to build knowledge (President's Council of Advisors on Science and Technology, 2008). Balancing the demands of the market or problem-space with the demands of academic rigor can strain efforts, typically leading initiatives away from the academy and toward the marketplace. Moves away from standard academic methods of peer review often warrant the creation of independent quality-control agencies to monitor knowledge production—such as the FDA for the biotech industries. However, there are an increasing number of fields moving from the academy toward the market that have not established non-academic methods for quality control (e.g., educational/psychological technologies, nanotechnologies, information technologies, etc.). If market mechanisms dominate the production of knowledge the impact of commodity fetishism is epistemological, creating a false consciousness of what is possible and preferable. If the pressure to find workable solutions overrides care and due diligence then the solutions adopted may create more problems than they solve.

Peer Review Processes

The first issue I want to address concerns how the field of applied developmental psychology engages *peer review processes*. For many of us the goal is not to publish in order to secure an academic position or advance knowledge; the goal is to build knowledge so it can be put to use. Success is thus not gauged in terms of standard academic acumen. Rather, success resides in the ability to execute effective applications and garner support for the methods and approach. Put crudely, success is measured by whether the approach sells. If the approach sells, why take time and energy to publish in peer-reviewed journals? Moreover, so the thinking goes, it sells because it works and it works because it is true (or accurate, valid, reliable, etc.). However, as Marx pointed out long ago, the value and popularity of a product on the market is typically not a reliable index of its actual worth. Market dynamics should not be understood as a proxy for peer review.

The market value of usable knowledge about human development is contingent on a variety of factors. Academic credibility is one factor. But the relation between the academic or scientific value of an approach and its market value is not straightforward. In knowledge intensive applied fields, end users—clients, customers, consumers—are typically not in a position to evaluate the validity of academic or scientific claims about the product; we must take the pharmaceutical companies at their word because we don't understand biochemistry well enough to determine the validity of their claims. Applied developmental psychology is no different. End users are typically not in a position to interrogate the claims made about the effectiveness of approaches or the reliability of metrics. This situation is not necessarily a problem. The FDA serves my interests as a consumer of pharmaceuticals by standing in place of peer review processes. But in fields where the market is growing and there are no comparable agencies exercising quality control in place of peer review, problems can arise. Situations occur where the *appearance* of academic credibility creates more market value than actual academic arguments and practices. This is, I think, where we are at as a field, mainly as a function of the fact the education is a growth market; we are simply scrambling to meet demands.

None of this is to say that the peer review process as it is usually practiced is flawless. There are major problems with many peer review practices (see Tipler, 2004). They are typically slow and can be contentious. They often simply enforce orthodoxy and squelch innovate thinking. So I am, in fact, not suggesting that we developmentalists go through standard channels. Many of these channels are closed in principle to the approaches we endorse. Or they are prohibitively difficult and time consuming for non-academics. I'm suggesting that we institute new channels. Facilitating peer review and collaboration could be an important function of the aforementioned proposed *Institute for Applied Developmental Theory*. For example, Heikkinen (personal communication) has suggested the construction of an information clearing-house for developmental approaches. Guided by a shared set of standards—co-constructed and revisable—a rigorously and collectively edited ever-expanding web resource for consumers and practitioners could serve as a place to vet research and development efforts while also increasing transparency between various stakeholders.

In any case, the idea that serious intellectual work needs to be looked at from a variety of perspectives by a community of those capable of assessing its value is critically important. The understandable rush to meet the demands of immanent educational crises should not lead us to embrace less rigorous forms of knowledge production. If anything, the historical moment should lead us toward new forms of collaborative knowledge building. Our inability to forge these collaborations, and the related tendencies to circumvent peer review, stem in part from a *lack of epistemic humility* that characterizes large sectors of the field. This is the second issue I want to discuss.

Lack of Epistemic Humility

It appears that when the extramural construction of useable knowledge is accompanied by success and acclaim we are prone to overgeneralizations concerning the implications of what has been achieved. Already a set of models and metrics (not to mention their makers) have taken on an almost mythical status, leading some to voice explicit concerns about a kind of crypto-religiosity that haunts the field. This is, of course, related in part to a lack of peer review practices. The tentative, exploratory, and experimental attitude that allows for scientific advance and collaboration is not a prerequisite for participation in the field, as it would be if rigorous and collegial peer review were standard practice. But this lack of epistemic humility is also a unique liability resulting from the subject matter of applied developmental psychology. Because these models and metrics can be used to hierarchically rank human capabilities and dispositions they are often taken to heart—they become enmeshed in how individuals regulate their self-esteem. Moreover, because of the erroneous belief that "higher is always better" (more on this below) those who take certain models to heart position themselves and their models "at the top."

This leads to curious argumentative strategies, strategies that insulate models from criticism (and thus improvement) and effectively cut off the possibility of collaborative and self-critical knowledge production. For example, I have encountered the following argument more than a few times. During a debate about aspects of a model, supporters of the model position the arguments of the critic (or the critic themselves) in terms of the hierarchy specified by the model being debated. The critic falls short of the level at which the model is claimed to have been built and is therefore deemed incapable of rendering meaningful arguments against it. In other words, arguments (or individuals) below a certain level—as specified by the model under discussion—are rendered second-class interlocutors, deemed intrinsically unable to offer cogent criticisms. I will call this an argumentative strategy that relies on *developmental disqualification*. It is a style of argument unique to this field and it insulates models from criticism by claiming that certain participants in the debate are developmentally disqualified from being taken seriously. This is reminiscent of the classic psychoanalytic quip that anyone who does not believe the basic tenets of psychoanalytic theory is simply resisting analysis. It is also similar to certain types of religious arguments that justify the faith by positing the delusory status of all of non-believers.

Arguments that rely on developmental disqualification commit the classic logical fallacy of *petitio principii*. They are question-begging arguments, presupposing what they set out to demonstrate. One cannot use an argument that assumes the validity of a model in defense of the validity of that model. These arguments also constitute an interesting sub-class of *ad hominem* arguments, and as such may be unethical as well. They convince only the ones making them and leave those they are deployed against unconvinced at best, marginalized and silenced at worst. But regardless of their less then enviable logical qualities, they are simply unproductive. How can collaborative and self-critical knowledge production be advanced when certain types of contributions (or contributors) are systematically devalued?

Well over a century ago, C.S. Peirce (1869) argued that inquiry-oriented communication communities must have an open and inclusive structure predicated on trust, honesty, and reciprocity. Based on his extensive work as a scientist, logician, and philosopher, Peirce clarified the intersubjective conditions for the possibility of reliable knowledge production. Habermas (1990) and Apel (1996) have followed his lead, broadening the project so that it assumes the shape of a general *discourse ethics*. This lineage of theorizing clarifies the fact that systematically distorted forms of communication disfigure communities and undermine their efficacy. Developmentally disqualifying potential participants systematically distorts communication, creating an insular, self-congratulatory, and defensive in-group over against an out-group that has been deemed intrinsically unable to say things that matter.

But note the specifics. As mentioned above, I don't know enough about biochemistry to argue with drug manufactures about their research and development efforts. If I decided to voice an opinion anyway, say on their plan to target the metabolic pathways that lead to neurodegenerative disease, I would likely be misinformed or just plain wrong. This would reflect a lack of disciplinary expertise on my part. But, in this context, a lack of disciplinary expertise is not a disqualification; it just makes me more likely to be wrong or misinformed. Ideally, my argument would be heard, and then refuted, such that I would come to see my own arguments or knowledge base as inadequate. But to claim that someone is developmentally disqualified is to claim more than that they are misinformed, lack training, or are just plain wrong. It is to claim that they are intrinsically unable to produce arguments that count. This is a way of dismissing and silencing potential participants, as opposed to hearing them out and then addressing their arguments as arguments.

But arguments are arguments, regardless of the developmental level with which they are associated. Likewise, people are people. The systematically distorted forms of communication described above result from a lack of epistemic humility on the part of those who endorse certain developmental models. The idea that a privileged few possess some special knowledge is a perennial ideological motif. But wedding this ideological motif to usable knowledge in developmental psychology is a contemporary contrivance. Moreover, the dismissal of an argument, belief, or orientation solely because it is suspected to be the product of a certain developmental level reflects a profound *lack of clarity about the normative aspects of human development.* This is the third issue I want to discuss.

Lack of Clarity about the Normative Aspects of Human Development

J. M. Baldwin (1906) and Piaget (1970) theorized in an epistemological mood. Kohlberg (1981) was worried about the naturalistic fallacy. Harry Stack Sullivan (1964)—who Loevinger (1976) called the father of ego-development theory—understood the integrative powers of the self-system as ethically neutral, arguing against defining maturity in moral terms. The progenitors of our field did not assume that higher-level performances were necessarily more valuable; they set out to test this belief, combining empirical and philosophical analyses. They limited their normative claims about development to well-specified areas of human capability, clarifying the developmental logic of certain specific learning sequences. And when they used prescriptive, normative, or ethical language, they did not draw it directly from the empirical substance of their models. Baldwin looked to Spinoza, Kant, and Schelling. Piaget looked to Kant and a host of modern formal logicians. Kohlberg looked to Kant, Dewey, and Rawls. Sullivan looked to G.H. Mead and Whitehead. This kind of division of labor between philosophy and psychology in the study of human development is important to maintain (Habermas, 1990), especially in the current context of educational crises.

Developmental models are made to describe and explain developmental processes (Stein & Heikkinen, 2009). However, as just discussed, some models have also come to serve an overtly normative function for many who use them. This means that conversations about what it means to be a good person, about human potentials that are admirable and worth striving for—conversations about the shape of a life that has not been misspent—have become conversions populated by terms from specific psychological models. Likewise, these same models provide the language we use to disapprove of beliefs and actions or to characterize others as unworthy of emulation. This is quite a burden to place on a psychological model, making it into a system that discloses the normative dimensions of personhood and facilities the ethical ranking of individuals. Again, concerns about the crypto-religiosity of the field are well taken.

As I have argued elsewhere (Stein, 2008), the use of models from developmental psychology to determine the distribution of admiration, respect, and responsibility is wrongheaded both methodologically and ethically. This is not the place to rehearse these arguments, which hinge on the canonical differentiation of facts from values and a preference for democracy over meritocracy. Suffice it to say, one of the greatest risks to the integrity of our efforts is the misuse of developmental models as broad evaluative frameworks, or what Rawls (1996) would call "comprehensive doctrines" concerning the nature of human life and value. Since Freud first drew the analogy between analysis and confession, psychologists have had to avoid positioning themselves as a new priestly caste. In cultural contexts where traditional worldviews have been thrown into question by the disenchanting gaze of scientific rationality, there is a vacuum where religious self-understandings used to reside. Charles Taylor (1989) has diagnosed this as a lack of *languages of strong evaluation*—a lack of shared categories and distinctions about what makes a human life successful.

Developmental psychology should not aim to offer these kinds of categories and distinctions (nor is this the province of philosophical meta-theory). Ambitions along these lines reflect both a profound misunderstanding of psychology as a discipline and a remarkable naïveté concerning the genesis and grounding of our most basic normative commitments. No doubt, new values must be created if we are to navigate the immanent educational crises discussed above. But the creation of new values—the birth of a new comprehensive doctrine—cannot be engineered by social scientists (Habermas, 1984). The emergence of new worldviews takes place in the heart of the lifeworld; where vulnerable identities are forged under the pressures of unprecedented conditions and leaders and symbols emerge that embody a shared trajectory garnering broad consent and motivational force.

Conclusion: Summing Up

Quality-control efforts in the field of applied developmental psychology are just beginning. In this paper I set these efforts in a larger context to frame their significance and guide their direction. I argued that the challenges arising in the current post-national constellation are best understood as educational crises. The task demands of the global problem space increasingly outstrip available human capabilities. This situation is leading to a scramble for usable knowledge about education, which I defined broadly as any process intentionally undertaken to promote human development. There is a growing demand for techniques and technologies that catalyze the transformation of human capabilities; and this demand exceeds available supplies. Education becomes a growth market as specific types of human capabilities come to be recognized as scarce but valuable resources. This pressing global demand for innovative educational solutions and approaches has the potential to systematically distort the production of relevant usable knowledge. I presented a set of general quality-control challenges that face the field of applied developmental psychology as it strives to meet the demands of a globalized crisis-ridden educational marketplace. I argued that the field should overcome temptations to circumvent peer review processes by going directly to consumers. I suggested adopting a general stance of *epistemic humility* so that research and collaboration are promoted and argumentative strategies that insulate approaches from criticism are avoided. Finally, I argued that more careful attention should be paid to the normative dimensions of the educational enterprises related to applied developmental psychology, as they involve the creation of new values and raise ethical questions about the shape of what life ought to be like.

It’s an Empirical Question: On Cognition and Ego

Katie Heikkinen

In light of the wonderful rejoinders to the paper by Zachary Stein and myself, I offer a few informal (and rather rushed) comments in response, focusing on three elements: 1) the dangers of labeling colleagues; 2) psychometrics; and 3) the relationship between cognition and ego. In the second half of my paper, I describe my current research project, which I believe will be of interest to many of you.

On Labeling Colleagues

One point made by Stein in his paper (this volume) is of such great importance that I wish to restate it here: “disqualifying” certain arguments as coming from a lower developmental position is both illogical—because this stance uses the “truth” of a theory to negate critiques of that supposed truth—and unethical—because this stance devalues and marginalizes voices of opposition. But I’d like to extend his point to note that while “developmental disqualification” is a rather egregious sin, using developmental theory to label colleagues, even if in good fun, is nearly as egregious.

For example, Stewart, Smith, and Suzuki (this volume) quip that “we can all acknowledge a strong ‘T/Achiever/Orange’ streak” in some but not all of our colleagues. Since everyone he mentioned are making psychometrics for the marketplace and, I presume, care deeply about human development, I struggle to see the grounds for distinction here. We are all in the same boat! It seems to me that the distinction hinges on some rather messy conflations of structure and content. Various values such as interest in science or desire to self-promote (the content) can be held at multiple levels of complexity (the structure). This is an important distinction that Stein and I have made elsewhere (2008).

Without clear referencing to adequate data—and I think referencing particular value content is neither adequate nor clear—these labels are meaningless. They only serve to antagonize and threaten. Is this the kind of community we want?

On Psychometrics

Stein and I made a bold claim that the LAS and HCSS are the only calibrated metrics (2009). I am extremely grateful to Torbert and Livne-Taranadach (this volume) for their detailed description of the reliability testing of the LDP; to Stewart, Smith, and Suzuki (this volume) for their call for greater inclusion of the practitioner’s perspective; and to Basseches (this volume) for highlighting the importance of philosophical argument in determining the desirability of certain developmental outcomes. However none of these speak directly to the issue of calibration. While evidence of blind interrater reliability studies goes part of the way, it is not sufficient evidence of reliability to satisfy the requirements for individual assessment, which demand that statistical reliability is high enough to allow us to have a certain level of confidence

SOME RIGHTS RESERVED

in each possible score (See Dawson's table, this volume). Both Torbert and Cook Greuter argue that they have scored hundreds, if not thousands of SCT's. Submitting their data to a Rasch analysis to examine the statistical reliability of their scales would be a simple matter.

Finally, I wish to point out a few questions that remain open after our publication and its rejoinders. Has anyone further evidence of validity or reliability studies of the Spiral Dynamics metrics? What are the implications of Jane Loevinger having said the test was not to be used to measure individuals (Loevinger, 1979; 1993)? What is the "right relationship" between first, second, and third person approaches (Torbert and Associates, 2004) in the field of psychometrics?

On Cognition and Ego

In this issue, Murray wonders whether "the structural transformations happening inside the body (or body/mind/soul) happen according to a different type of mathematics or logic or geometry" than the logic of hierarchical complexity (p. 344). This is a very reasonable musing that I myself, and many of my students at John F. Kennedy University, have made. I agree with his observation that change in such domains as compassion or inner peace *feel* very different than change in understanding, say, physical science concepts.

However, thus far we have no evidence of this alternative logic. To unfold may in fact *mean* to unfold through hierarchical complexity. Note that I do *not* mean that hierarchical complexity is the only important or real dimension of human change. To the contrary—there are many, many human change trajectories—some healthy and adaptive, others less so. But to conflate change—even the healthiest, most adaptive changes of them all—with development is problematic (e.g. Mascolo and Fischer, in press). As Stein and I have pointed out elsewhere (2008), linking a notion of development with particular content—such as Murray's examples of attributes that characterize wisdom, from "letting go" to a "sensation of expansion" to comfort with "dissonance, uncertainty, ambiguity, and paradox" (p. 344)—makes it impossible to see high forms of development that are not characterized by that content. Surely there must be someone who is highly developed—a complex thinker skillfully adapted to his world—who does not feel expansive?

Ah-ha, I can hear you thinking. *But, Katie, that* means *that person is not developed*. Yes, but only if you define "development" as "expansiveness." But as Stein (this volume) notes, to do so is to make a normative move. Implicit in that distinction is something like "I believe that it is better to be expansive than non-expansive." This may very well be true! But then we must 1) be honest that we are making evaluative claims; 2) be able to explain clearly why we view such changes as developmental—without making recourse to explanations inherent to the claim being made (e.g. "it is higher because it is higher"). For example, one might argue that expansiveness is developmental simply because the progression is hierarchical. That is, the end state of "expansiveness" hierarchically integrates lower order tasks (even if by exclusion): expansive pre-contraction (e.g. A = {e}), expansive with contraction (e.g. A = {e, c}), and expansive post-contraction (e.g. A = {e, not c}).

This is fine—a reasonable definition of development that does not define itself by itself (instead it calls on structural distinctions). But how could we *measure* such a concept? I'll exclude for now methods like clinical observation, simply because the Stein and Heikkinen paper focused on more formal metrics—so we are left with something like self-report. For example, we could ask people to explain their emotional and embodied states in an open-ended interview. If we then scored these interviews using the LAS, we could find one of several trends: 1) The feeling of "expansiveness" is one that is *only* reported at higher Lectical levels; 2) The feeling of "expansiveness" is one that is reported at many developmental levels; 3) That some people reasoning at high Lectical levels don't mention expansiveness at all.

Each of these findings has different implications. #1 suggests that expansiveness as a feeling-state is only experienced or spoken about when people have developed a complex capacity to discuss their states overall. Thus it could be said that "expansiveness" is one of the characteristics common to highly complex performance of emotional state understanding. #2 suggests the opposite; that expansiveness is a feeling state available to people operating at many levels of complexity. So the concept doesn't characterize a particular level; instead, we can track whether and how the concept changes with development. What does a simple understanding of "expansiveness" look like, compared to a more complex understanding? #3 is an almost certain finding, whether #1 or #2 prove true. It is rare for *every* sample at a given complexity level to contain the same concept. So some people who reason about their feeling states in a highly complex—highly developed—way do not talk about a sense of expansiveness. We might argue that this person is less healthy or behaves less adaptively, but in this view, we cannot say they are less developed.

Another option might be to score these self-reports with a newly developed scoring system, based on the surface structure of the performances. However, if this new system were anything like Kohlberg's, Armon's, or Perry's, the LAS would serve just as well (e.g., comparison with Kohlberg: Dawson, 2003; comparison with Armon: Dawson, 2002, Dawson-Tunik, 2004; comparison with Perry: Dawson, 2004).

Some of you may still wish to argue that expansiveness is not necessarily coupled in this way to the capacity to reason about it linguistically—that regardless of self-report, "I know it when I see it" or "I know it when I feel it." This is reasonable. (First of all, I must make the caveat that "hierarchically complex" at least in terms of the LAS does not mean "complicated." It means highly differentiated and *integrated*. So the LAS does not miss the "simplicity on the other side of complexity," as some might claim.) But, again, how can we *measure* that ineffable state of being? We might use clinical assessments based on a set of criteria. A fine approach, but since it weighs on the expertise of the clinician, this approach is less scalable. We might instead develop a trait-inventory similar to a personality test. Fine again, but that is not developmental. At the simplest level, we can watch people and feel into them to determine how expansive they are. However, without psychometric procedures, this allows us to say nothing about the reliability or validity of such a judgment, or whether the capacity develops.

Note that in the end, even if we believe that the capacity to be or feel expansive is not tied to the capacity to reason about it linguistically, that it is somehow different and unfolds differently, we are still left with scant options other than linguistic self-report—*if* we wish to make strong claims about it being a reliable, valid, and developmental psychological construct. But if we do not wish to make such claims, clinical assessments, trait inventories, or informal “grokking” all have their place. In this light we might think of “expansiveness” as something akin to “kindness:” a valued character trait where most people “know it when they see it” but that has no psychometric or developmental properties. This doesn’t lessen the importance of kindness—norms matter deeply, but they should not be part of developmental metrics.

What the LAS has attempted to do is strip the normativity away from the assessment process. Stein (this volume) notes that such notables as Baldwin, Piaget, Kohlberg and Sullivan “used prescriptive, normative, or ethical language, [but] they did not draw it directly from the empirical substance of their models” (p. 15). This point is worth repeating—*they turned to philosophers*. I don’t think that this implies that psychologists have nothing to say about the normative aspects of human development. Some psychological findings—such as those linking various behaviors to happiness or mental health—do offer insight into how humans might attain certain desirable outcomes. But determining whether those desired outcomes *ought to be desired* is not the job of the psychologist—unless they are clear that they are “putting on their philosopher hat” in so doing.

I hope I’ve highlighted some of the challenges in determining whether “the structural transformations happening inside the body (or body/mind/soul) happen according to a different type of mathematics or logic or geometry” than the logic of hierarchical complexity (Murray, this volume, p. 344). Perhaps it’s true! But the science of measurement, it seems, struggles to make this distinction. Whether this is a current struggle—reconcilable with changes in methods—or an intractable struggle—because these aspects can only be known through linguistic performance—remains to be seen.

My Current Research Project

In this issue, Murray wonders whether “ego development” metrics such as those from the Loevinger tradition are “assessing some of the wisdom skills that [he] argue[s] may have elements that do not develop according to hierarchical logics” (p. 345). Musings about the relationship between ego development and hierarchical complexity are a start, but this is fundamentally an empirical question. One way to address this question is to re-score ego development data using a structural method (the LAS or the MHC). However, this is hard to do with SCTs because the stems are so short. Short sentences can be scored by the LAS, but without any justification by the participant, less confidence is placed in the scores. However, another such “ego development” model is Robert Kegan’s constructive developmental theory (1982; 1994), which features a validity profile similar to the current versions of the SCT (e.g. Torbert et al, this volume) in that it focuses on external or predictive validity (e.g. Kegan, 1994; Harris and Kuhnert, 2008; Lewis et al., 2005). I am currently working on a research project to address just this empirical question. I’d like to share my thinking with you here, in hopes that it sheds more light on some of the important distinctions Stein and I have made in previous publications (2008; 2009): content versus structure and metric versus model.

Kegan’s constructive-developmental model details how a person’s meaning-making structure undergoes qualitative shifts over the lifespan. This model includes five stages of change in an individual's "order of mind," which is an overarching structure of self-system organization. An "order of mind" includes cognition as well as intrapersonal and interpersonal abilities, all of which are hypothesized to change in concert with one another. Individuals are located on the stage spectrum by participating in a "subject object interview" (or SOI) where they discuss events that are emotionally significant to them. These interviews are transcribed and then scored using an inductive process that is supported with examples. The scoring process also depends on the skill of the interviewers, since they develop and test stage hypotheses during the interview itself (Lahey, Souvaine, Kegan, Goodman, and Felix, 1988).

Relying on an inductive process—where scorers infer underlying structure of meaning making—has important advantages over scoring methods that rely more heavily on concept-matching strategies, such as Kohlberg's (Colby and Kohlberg, 1987). Concept matching strategies "suffer from bias introduced by nonrepresentative construction samples and an overdependence on particular content" (Dawson, 2003, p. 337). Inferring underlying structure allows raters to "look through" disparate-seeming surface content to see similar structures that lie beneath (or vice versa). However, I argue here that the SOI, like the Standard Issue Scoring System, can only claim to "peer beneath" one layer of *structure*—the conceptual *content*—to view the surface (or domain) structure of a performance (Stein and Heikkinen, 2008). This places it in fine company—this is true of nearly all extant developmental metrics.

In contrast, the Hierarchical Complexity Scoring System and the Lectical Assessment System claim to be able to peer beneath *both* conceptual content and domain structure to discern the core structure that lies beneath. In recent years, research by Dawson and colleagues has shown that interview data collected for analysis with various domain-specific scoring systems can be scored with the domain-general Lectical Assessment System (or its precursor the HCSS), yielding results that suggest that all of these systems measure the same underlying developmental dimension, hierarchical complexity (e.g., comparison with Kohlberg: Dawson, 2003; comparison with Armon: Dawson, 2002, Dawson-Tunik, 2004; comparison with Perry: Dawson, 2004; see also Kitchener and Fischer, 1990 on reflective judgment). Dawson's research suggests that this single dimension is indicative of development in *any* domain about which we can reason.

This claim has important implications for the measurement of development, including for systems like the SOI that claim to assess "whole people." Might metrics of ego development less directly measure the same latent dimension? A handy, though limited, analogy is the importance of controlling for socioeconomic status (SES) in multiple regression studies. Since we know SES impacts so many educational outcomes, we could not trust our results if we did not statistically control for SES. Similarly, since hierarchical complexity is likely a latent dimension of *all* verbal performances, we must assess it separately in order to tease apart its contribution to the performance from the contribution of other factors.

By separately assessing hierarchical complexity, we are able to ask other important questions of the data. Just as controlling for SES allows the impact of other variables of interest to be seen, "controlling for" hierarchical complexity allows us to independently analyze conceptual change in the domain. We can see more clearly which aspects of the performance are related to an increase in hierarchical complexity and which aspects are not. The latter are referred to as "horizontal" differences (Dawson, 1998)—attitudes, dispositions, preferences, factual knowledge, and biases that vary at least somewhat independently from “vertical” complexity. Parsing out these two dimensions allows us to take a closer look at individual difference. We are also able to examine which concepts arise at what Lectical level (because concepts per-se are not tied to a specific level) and trace how concepts that arise early and persist change with development. Tracing a concept through Lectical levels produces a developmental sequence or set of learning pathways that is open to continual refinement (Dawson-Tunik, 2004; Dawson and Stein, 2008).

By scoring the SOI transcripts using the LAS, I will be able to discern how much of the variance in SOI scores is explained by hierarchical complexity. Note, however, that the claim is *not* that hierarchical complexity can explain all the important dimensions of human development. On the contrary, Dawson stresses that hierarchical complexity is *only one* dimension by which to evaluate performances. Her methodology of “developmental maieutics” calls for the close partnership of scoring experts (Lectical analysts) with content experts (experts in the domain being assessed) to ensure that that the full richness of the domain is included (Dawson and Stein, 2008). However, the analysis of domain specific content is a separate process, distinct from the process of scoring. Only after both scoring and content analyses have been completed are the scores and themes re-married to produce rich descriptions of conceptual development—the developmental sequences.

My study will reveal whether interviews like the SOI where people talk about their emotional reactions to important events in their lives provide good “fodder” for the LAS. If the LAS scores and the SOI scores are in agreement, or if the LAS explains a large portion of the variance in scores, it suggests that the SOI coding system, like those of Kohlberg, Armon, and Kitchener and King, taps the hierarchical complexity dimension. This may be due to a property of the scoring method itself—the SOI manual may actually take hierarchical complexity into account in its process, despite calling it by another name. Or, it may be a completely implicit effect—more hierarchically complex samples simple "feel" higher, regardless of the explicit scoring instructions.

This finding would raise questions about the need for a distinct scoring system for ego development (Theo Dawson, personal communication, 11/14/09). The SOI method of scoring would be redundant if it did not add any additional information over and above hierarchical complexity. This does not mean that self-object theory itself would necessarily be brought into question. In fact, results of this kind would serve as an external validation of the current sequence. But using the LAS to score SOI performances would allow researchers to continue to address, in a rigorous manner, the empirical question of how the content of performances on the SOI change with development. As I’ve mentioned earlier, separately analyzing hierarchical complexity and conceptual content allows us to create learning sequences that carefully track the evolution of a concept or skill. These learning sequences themselves are free to change as the research base accumulates or as the culture changes and how concepts are used is altered. In other words, the scale stays the same even as what we know about development in that domain changes. In addition, clarity around what elements of performances are vertical and which are horizontal allow for the horizontal dimensions to be studied with other methods, like the thematic coding in the present study—or myriad possibilities like surveys or scales. Finally, using the same scoring method and scale in multiple domains allows us to make meaningful comparisons across domains, which is not possible when each system's score stands alone.

An important distinction to remind the reader of here is between *model* and *metric* (Stein and Heikkinen, 2009). Both models and metrics in developmental psychology are *representational devices*: "methods, symbol systems, and propositions—built by communities of developmental psychologists—which in some way claim to be *about* cognitive developmental processes" (p. 7). Metrics attempt to assess how much of a psychological trait is present, while models attempt to explain its presence and describe its origin. The LAS and the SOI are metrics; skill theory and constructive developmental theory are models. While models are necessarily linked to their respective metrics, they are not the same. In the present study, the implications impinge on the SOI metric, not the CD model. The subject-object shift may be an important causal mechanism in how development occurs—but hierarchical complexity measures this shift just as well, or as Dawson has argued, even better.

My study will also reveal the role of hierarchical complexity in how people talk about important events in their lives. Complex thinking may play little role in the interview as a whole—complex language is simply not needed to tell a good story about an important event. But the little moments where people show evidence of their more complex ways of thinking may say a lot. These "moments of complexity" may provide insight into how the performance as a whole hangs together; and indeed shed light on their "meaning making structure" by explicating how they perceive interconnections and links between various elements of their story. The learning sequences in particular might reveal how the concept of (for example) "taking responsibility for my own emotions" changes across development—from a "hollow concept" that is stated but not explained to a more rich and nuanced description of what such responsibility means and what forms it should take. These sequences may, in the end, echo Kegan's writings, but they will be arrived at via a different method. This may provide additional support for certain aspects of the constructive-developmental model.

If the LAS cannot be used to score these data, there are several possible explanations. It could be a simple "mechanical failure"—the present data may lack certain properties that are required for scoring with the LAS (such as sufficient evidence of reasoning and adequate length of reasoning performances). But if there is enough material present to assign a firm complexity score, and the scores provide a different ordering of the passages than did the original rater, the implications are quite intriguing. The SOI may be looking for a property that does not vary with hierarchical complexity, but is on its own, independent developmental trajectory. Or, particularly at the higher levels of ego development, a new simplicity may be attained that hierarchical complexity fails to see. These are all questions Murray poses, but this kind of empirical approach has the potential to answer them.

Overall, my intention is to improve measurement in developmental science and to better bridge the gulf between ego and cognitive development theories. I think that understanding stage development in adulthood is important and useful and I encourage wide-ranging use of developmental thinking. But I also wish to see the *science* of developmental stages advance, and this involves building bridges between different measures and metrics. The LAS has the unique potential to be a domain-general *ruler* of any development that is expressed through language broadly construed. Although other systems may tap into important aspects of development in their own right, only by accounting for hierarchical complexity can we make meaningful comparisons across systems and thus advance our understanding of development in multiple domains.

I am excited about this project and welcome any feedback or further inquiries.

Political Aspirations for the Special Issue, *Toward Development of Politics and the Political*

Sara Nora Ross

> *There is no question that in our age there is a good deal of turmoil about the manner in which society is run. Probably at no point in the history of man [sic] has there been so much discussion about the rights and wrongs of the policy makers…[We begin] to suspect that the people who make the major decisions that affect our lives don't know what they are doing…They don't know what they are doing simply because they have no adequate basis to judge the effects of their decisions. To many it must seem that we live in an age of moronic decision making.*
>
> —C. West Churchman (1968, p. iv) in *The Systems Approach*

Welcome to *Integral Review's* (IR) special issue on the theme *Toward Development of Politics and the Political.* Not only is this theme political. Beyond the content that shows up in a journal, the act of publishing itself is also political, political behavior we engage consciously at IR. This special issue integrates its political essays with the politics of publishing, the politics of inviting works to publish, and now the politics of writing an editorial. I use this editorial space for three purposes: to share our motivation for doing this special issue, to introduce its contents, and to reflect on such influences as these for integral thinking about politics and the political and what that can mean—I would say, *must* mean—in today's world.

Our stated aim for this special issue was to make a "politically significant contribution to public knowledge and discourse, to illuminate a comprehensive range of considerations that need to be integrated into effective approaches to today's—and the future's—political behaviors and complex political issues, policies, and systems."[1] This aim is consistent with IR's mission to

> publish a transdisciplinary and transcultural range of works that, taken as a whole, model integral ways of perceiving, thinking, researching, and serving the world we live in… In general, they will reflect some holistic understandings of issues in individual and social life, change, and development.…[IR] encourages attention to the interactive dynamics among individuals, communities, organizations, societies, and international bodies. It invites attention to categories such as the socio-cultural, political, economic, technological, and environmental…to portray the range of factors that need to be integrated into effective approaches to today's complex issues.[2]

---

[1] From the original call for submissions to the special issue.

Thus, we have the conviction that *integral* ways of perceiving, thinking, researching, and serving the world apply holistic understandings to change and development, and that these are necessary to conceive the factors essential in solutions to complex issues. This conviction drives our commitment to publish *new* thought, research, and praxis. Realizing the potential of new work to help address such turmoil as Churchman declared 40 years ago, the purpose of this special issue is to offer new perspectives on politics and the political.

To accomplish this aim, we invited works drawn from one to many disciplines. We conveyed a broad conception of politics and the political. For example, works could relate politics to forms of power, government, and policy making (one dictionary definition) or, more broadly, governance. They could treat politics as the total complex of relations among people living in society (another dictionary definition). They could emphasize political ecology, political economy, political geography, political psychology, political regression, or political development. Regardless of authors' areas of emphasis, the treatments of politics and the political would be consistent with our normative interest in *developing* political relationships, behaviors, impacts, strategies, assumptions, processes, structures, systems, and formal and informal institutions. We welcomed such examinations at any scale from micro to macro. That meant works could range from the scale of individuals, groups, and nations to international and multinational entities and the global commons of humanity. And indeed, such an array comprises this issue.

The message *to develop* in the political domain comes also from one of the 20th Century's most integral thinkers. A hard-hitting invitation for transforming political thought and action, Bateson's message may be more poignant now than when he first delivered it 40 years ago.

> If I am right, the whole of our thinking about what we are and what other people are has got to be restructured. This is not funny, and I do not know how long we have to do it in.… The most important task today is, perhaps, to learn to think in the new way…. The step to realizing—to making habitual—this other way of thinking—so that one naturally thinks that way when one reaches out for a glass of water or cuts down a tree—that step is not an easy one. And quite seriously, I suggest to you that we should trust no policy decisions which emanate from persons who do not yet have that habit.
>
> —Gregory Bateson (1972/2000, pp. 468-469) in *Steps to an Ecology of Mind*

How is one to "get" the dots Bateson connects here? What makes reaching for a glass of water comparable to cutting down a tree? And what relates doing such concrete tasks as *those* with the demands of making policy decisions? What *kind* of thinking is Bateson elevating to essential *habit*? As his extensive writing makes clear, he elevates *integral* thinking because in present-day contexts, the time to restructure the whole of our thinking grows only shorter while consequences of *not* doing so grow only greater.

Resonating with Bateson, our motivations to do a special issue looking toward development of politics and the political meant we too looked for integral thinking, "thinking in the new way," in selecting manuscripts for publication. How were these evaluated for inclusion?

“Integral”[3]

Baseline Integral Criterion of IR

Here at IR, one of our baseline “integral” criteria is that works published exhibit some developmental or evolutionary awareness. This can and does look very different, depending on the nature and scale of an author’s endeavor. And that is because nature and scale of an author’s work involves different ways of focusing attention, driven by the author’s unique purposes. The deployment of developmental or evolutionary awareness in this special issue, for example, takes a multitude of forms when authors do one and sometimes more of the following:

1. Advocate for developmentally different dynamics including additional perspectives in a particular context to transform them.
2. Analyze different dynamics in a particular context so they can be understood developmentally.
3. Examine events or conditions to contrast “what is” with what needs to be developed (or was developed, or is in the process of developing).
4. Propose a method, policy, or action for developing something that one judges needs to develop for greater justice and/or effectiveness.
5. Report on a case or method that reflected developmental concerns either in the case/method itself or the report, or both.
6. Theorize or demonstrate a way to reframe assumptions, concepts, and/or approaches so their replacements contribute to more developed thought, research, or praxis (and praxis includes policy).

Such developmental and evolutionary purposes as these characterize probably all the works published in IR to date. Purpose shapes the *nature* of whatever humans produce. This brief discussion of how developmental awareness can show up is a platform for the following look at the concept of integral, where I suggest that different *scales* of attention make “what’s integral” show up differently.

Contested Term

It was about six years ago, when we were first considering how to entitle this journal, that I was not in favor of using the term *integral* anywhere in connection with it. My reasons were simple: already in 2004, the term integral was contested, with diverse meanings and projections slapped on it from various directions. To position the journal and its publisher in those unclear waters seemed to me, at the time, likely to divert energies that should be invested in the publishing mission itself. It would save time and energy to steer clear of those waters. Of course, as it turned out, we did not steer clear of them at all, but rather directly into them. We (the original editorial committee of ARINA, Inc., IR’s publisher) decided the journal’s main title could and should be *Integral Review* and that we would figure out how to tango with the politics and meaning-making around “integral” as we went along. And, that we have done.

---

[3] Editors at IR can use the term *integral* in different ways. This writing reflects my perspective.

Thus, in conceiving how to approach this editorial, I was surprised to find myself feeling compelled to speak to the meaning of *integral* for this special issue. Prediction confirmed: it is time- and energy-intensive to deal with the extremely multifaceted challenge of using, communicating, and teaching about particular uses of *integral*. That is because there are already so many meanings and projections associated with it.

For some, “integral” refers to an individual scale of personal or spiritual consciousness or the kinds of individual practices one performs. For some, it may refer to Ken Wilber and/or AQAL, for some it may refer to identifying multiple perspectives, for others it may be different yet again, and for yet others it may be “all of the above, and more.” So be it!

The complexity of this multifaceted challenge signals to me that it is indeed time to develop a new paradigm for assessing “integral”—one that rises above such limitations as indicated above and many others besides. And one of those limitations is the time and communication dimension. I propose it is time to implement more content-free applications of “integral” by using it in the high-level fashion its core definition has always really suggested. We can elevate our use of the concept by elevating how we think *about* and *with* the concept and using *methods* that support that meta level use. Then we do not have to abandon the useful concept because its surrounding waters have become so murky. We can give the term *integral* a fresh start in a new generation of applications, which would perhaps be accessible enough that Churchman’s, Bateson’s, and others’ concerns for more integral thinking and policy would be closer to being addressed and transdisciplinarity would potentially have new modes of cross-cutting analysis. That is my current thesis.

Assigning Meaning to “Integral”

For many years, my meaning for “integral” has been in the dictionary sense of *essential to completeness*. This definition can be problematic, because as we know from a developmental perspective, what might be considered integral, essential and/or complete is different when done at different levels of complexity. We cannot assume a given concept means the same thing to everyone. This in turn confronts us with another fact of social life: language is inherently limited in conveying concepts (which is why I am discussing them here at all). When these facts of life are integrated, we can predict that *virtually every abstract concept can and will mean something different to people with different concerns related to it and to people reasoning at different levels of complexity about those concerns*. A developmental perspective generates this essential principle.

Is such a principle a propulsion into relativism around what integral “means” (or, for that matter, what any other concept means)? Not at all. Rather, it should propel us in three constructive directions.

- It should remind us that such abstract concepts are *only* concepts, not to be reified *as if* they “are” a specific or concrete “thing.”
- It should ground us in the essentialness of developmental awareness.
- It should divest us of certain assumptions and thus free us not only to be precise about criteria for considering what’s integral—essential to completeness—but also to be clear about the contexts of and scales at which we apply various criteria.

From the analytic perspective used here, what might be considered essential and/or complete will also depend on such additional factors as

- the complexity of a phenomenon,
- the information available,
- the complexity of the perception(s) of the phenomenon and the information, and
- the resulting complexity of the assessment(s) task itself, and
- methods and capacities to perform the assessment.

If there are so many crucial variables in the task of deciding what is essential to completeness, how can we put this particular definition of integral to good use?

In my analysis, clarifying the *nature and scale of an endeavor* is an important starting point. It affords a cross-cutting route into figuring out if and how an endeavor reflects an integral approach that is suitable *in and for the endeavor's context*. Such a cross-cutting method begins with clarifying the nature of an endeavor and its scale. Once we have clarity about those variables, then we can analyze with lenses aimed both *at* and *beyond* the endeavor's specific content. Only then, I would say, are we positioned to consider the appropriateness or sufficiency of the endeavor's *depth*, certainly a criterion for completeness regardless of subject matter. Because systems of complex relations are nested within a multitude of other systems—and this recognition is a key one in considering the depth of integral analysis—scales are not mutually exclusive; multiple scales may be interrelated and/or integrated within one written work (e.g., see in this issue, Anderson, Atlee, Couto, Quilligan).

This discussion has introduced (though not completed) the notion that "integral" is an abstract concept that cannot be reified and will forever be contested if one insists it be given content-dependent applications. There *is* a way out of the contest. Rather than apply a pre-conceived notion of what might be integral, the "essential to completeness" angle affords reframing. Instead of trying to map an abstract, contested concept onto an endeavor as an evaluation method, we can focus our attention on the endeavor itself and ask, "Completeness of what, for what purpose?" This anchors us immediately in the endeavor's context and scale. In other words, rather than take "integral" as a starting point, we can take the endeavor as the starting point and then consider what is "essential to completeness" about the endeavor. *The endeavor's scale should set the scope for our assessment*. This means we need to adjust our lens to the endeavor and evaluate it *given its nature and scale:* align our evaluative units of analysis with the scale of the endeavor. Units of analysis will differ, depending on the variables to be analyzed.

Macro
global crises,
global interactions and effects,
policy evaluation,
high-level principles and general theory

Meso, and Meso→Macro
levels of policy (local, national, etc.),
domain-specific theory
organization/agency,
eras,
nation-states

Micro, and Micro→Meso
intervention methods,
individual and group action theories,
attitudes toward constructs and *toward* issues,
constructs *as such*

Figure 1. Examples of scales of endeavor.

For example, variables treated in this special issue range from the scale of constructs (e.g., *power, legitimacy, becoming-responsible, integral politics*), to the scale of attitudes toward constructs and toward issues, to the scale of theories, to the scale of individual and group action, to the scale of intervention methods, to the scale of nations, to the scale of eras, to the scale of policy, to the scale of global interactions, to the scale of methods to evaluate policy, and to the scale of global crises. Many of these may be interrelated and integrated within one author's work, resulting in multiple variables *of* different scales synthesized *at* another, higher scale.

These general ideas can be applied in a preliminary way right here. Figure 1 is a broad indicator of various scales addressed by authors in this issue. This approach to indicating the nature and scale of a given endeavor continues as I introduce the works by these authors.

In this Special Issue

Authors address their subjects at a variety of scales from the individual to global, and certain themes overlap and weave through these treatments. As devices for organizing this overview, I cluster articles by certain kinds of similarities in their nature and/or by shared themes. The vital caveat is that in no case can any of these articles be reduced to such simple categories: each offers more complexity than categorical schemes can convey.

Theory and Paradigm Development

Power: Unpacking, Reframing, Scaling

One way or another, perennial political topics of power and legitimacy weave through this entire issue, with quite a few authors offering complex renderings at contrasting and overlapping scales. In the hands of Phillip Guddemi, Richard A. Couto, and William R. Torbert, for example, an examination of *power* ranges from the most basic level of examining power as a construct, to a principled theory that reframes power and terrorism, to development of principles for the power of balance. The several participants in the rare kind of conversation modelled by Phillip Guddemi in his *A Multi-Party Imaginary Dialogue about Power and Cybernetics*—rare to our political detriment—question and deliberate the very construct of power, give it deep looks from dynamic relation angles, and come to a cybernetic reframing of power with implications for developing political wisdom. In *The Politics of Terrorism: Power, Legitimacy, and Violence,* Couto theorizes a new paradigm for understanding the politics of power and terrorism. In the course of doing so, he begins at the scale of first person experience and examines settings and interpretations, shifts to the scales of constructs, definitions, and theory where he reframes legitimate power and direct and indirect violence and terrorism, and develops this paradigm—which leads inevitably to his proposing a specific kind of reform of domestic and international policy toward terrorism as redefined here.

In excerpts of Torbert's 1991 classic, *The Power of Balance: Transforming Self, Society, and Scientific Inquiry* are essentials of his developmental action inquiry paradigm. As both political theory and action science, it describes a form of political power that encourages inquiry, even of its own foundations. He proposes new political principles of inquiry and quality—and what their elevation as principles means for society, academic disciplines, and practice. The emerging general theory of inquiry and its first, second, and third person practices span all scales.

Through these contributions and others introduced below, integral approaches to conceiving, using, and analyzing power, and to reforming policy and structures of power show up at micro to macro scales, a spectrum of potential influence on politics and the political.

"Integral Politics"? Defining, Proposing

Using distinctly different approaches to posit the need for, and then define, something called "integral politics," Daniel Gustav Anderson and Tom Atlee nonetheless share complementary premises (e.g., becoming-responsible and conscious evolution, respectively) in arguing for integral political behavior originating at grassroot, micro scales and evolving at all scales. In *"Sweet Science:" A Proposal for Integral Macropolitics,* Anderson critically reviews two Wilber-integral models for their ontological assumptions and directionality and queries implications for politics founded on them. He develops his theoretical foundation from an opposite direction, elucidating it via drawing out Blake's model in *The Four Zoas,* and contrasts its integral foundations with other models. Anderson analyzes at the scales of ontology, theory, and individual and collective behaviors. Atlee proposes his definiton and dynamics of *Integral Politics as Process*, and explicates the ramifications across many domains of public life and behavior. Like Anderson, Atlee too has a conception of wholeness and organic coherence. In their analyses and discussions, both authors depict or at least meaningfully implicate micro, meso, and macro political scales, theorizing the dynamic behaviors associated with the kind of practical, principled integral politics they propose.

Organized Non-Partisan Political Interactions: Designing, Conducting, Learning

Interactive group efforts toward development of politics and the political reveal a variety of ways to integrate (implicit or explicit) theory and practice. The vista of multifaceted practice unfolds across six essays anchored in practical experience, two of these in the *Integral Review*-tradition of Russ Volckmann interviews with seasoned practitioners. Because these works discuss mostly in-person endeavors with individuals, they include the scales of self and groups, and therefore of social-perspective-sharing, a capacity long posited as characteristic of integral interpersonal design and practice.

Jake Chapman reports on *Lessons from a Pluralist Approach to a Wicked Policy Issue*, identifying archetypal voices commonly heard in his public policy work in the UK and making the case for a systems approach in public policy at the local level. Ken White analyzed findings from a series of action research with Generations Salon groups in the US, theorized about them, and now shares a different kind of archetypal analysis and introduces his three-dimensional model for practical, processual implications for why generational eras of US citizens can, and should, develop *Politics in a New Key: Breaking the Cycle of U.S. Politics with a Generational/Developmental Approach.* These contributions illustrate that archetypal patterns crisscross other scales of analysis, while affording their own individual- or time-transcendent scales.

Russ Volckmann sought interviews that draw attention to the scale of design principles and processes, seeking integral lenses on *Design and Sustainability* with Michael Ben-Eli and civic engagement politics or *3D Democracy* with Jan Inglis. As Volckmann observes, theirs involve political acts often taken outside the realm of formal politics. By contrast, Elke Fein and Hans-Peter Studer report from the field in *Integral Politics: A Swiss Perspective*, recount the history of their NGO's several years of efforts, and announce the late 2010 planned launching of a political party, "Integrale Politik (ip)." Their report shares the meso scales of ip's processual and organizational development.

The foregoing endeavors include the scale of design of activist and/or participatory processes and interventions and those designs' relationship to public process and political structures, dynamic political cycles over short and long periods, issues that need to be addressed, and the evolutionary effects on, and of, culture and society at various scales.

Theory-Based Analysis

Elke Fein presents her project analyzing political discourse in Russia, in *Adult Development Theory and Political Analysis: An Integral Account of Social And Political Change in Soviet and post-Soviet Russia.* She conducts her analysis by comparing and building on various kinds of systems: historical conditions in past and present, effects of those conditons, and how political discourse is conducted. By interpreting conditions, behaviors, and discourse through the lens of political and adult developmental theories, she models an integral approach to synthesizing theory and application in supporting her argument's claims.

Meta / Analysis of Analysis

In *The Superbubble behind "The Great Moderation:" How The Brandt Report Foresaw Today's Global Economic Crisis,* James Bernard Quilligan's political economic framing reintroduces the Brandt Commission's work on its 30th anniversary. The scope of international monetary policy is more inclusive of other 21st Century concerns than meets the eye; for example, Brandt emphasized that sustainable development could not reach intended goals until the global monetary structure ceased to undermine the very changes upon which sustainability depends. Quilligan analyzes key types of structural imbalances as he compares conditions before and since the Brandt analysis. He identifies the large-scale sovereign, currency, and purchasing powers currently structured into the global system and supports the Brandt argument for reform of international monetary policy. Reform there will in turn reform the global political balance of power—if long-term structural roots of the global economic crisis are to be transformed.

To consider, much less actively address, restructuring relationships at the global level invites examination of assumptions about globalization or assumptions guiding analyses around the concept of "culture." Such tasks may both become easier and become more challenging after reading Meg Spohn Bertoni's *The U.S. Imperial Jugger*-not*: Saturation Points and Cultural Globalization.* Easier in the sense of being liberated from a handful of erroneous assumptions about the effects of globalization processes; more challenging in the sense of seeing nonlinear relationships among very large systems. Spohn Bertoni's project should set straight some common misconceptions about globalization and culture, and support more meta level views of global system dynamics, including her use of nonlinear dynamics concepts to expose the nature of the movement and saturation points of cultural globalization.

Such attributions of simple causation such as Spohn Bertoni puts to rest would be less likely to get traction if more meta level, systemic thinking characterised 20th-21st Century life and thought. Steven E. Wallis, in his *Towards the Development of More Robust Policy Models*, applies what he calls neo-integral thinking and metatheoretical methodologies to conduct critical comparisons of logic models. He proposes a deceptively simple quantitative test of robustness for policy designs' logic models, for learning and reflection in policy model building, and assessment of a model's sufficiency: how much complexity does it indicate was considered, by the way the model builds in the interrelationships of factors? Wallis proposes "neo-integral" thinking and methods should be applied to the creation of more mature policy models by encompassing greater complexity and a careful understanding of interrelationships.

Toward Development of Politics and the Political

To begin this piece with the Churchman and Bateson invocations from our past could introduce our motivations for publishing this issue, could highlight dismay at policy- and decision-making, could underscore continued urgency to set our planetary course aright, and could possibly reinforce attachments to the sidelines of theoretical armchairs and post-game or post-election 20/20 vision. These would be politics as usual, yes?

Yet our purpose here is to help our world develop beyond backward-looking politics as usual. The service of our present and future lies in the Eternal Now. The contemporary voices published here should give us hope. Why?

- Because they are doing pathfinding of the kind so essential to transforming 21st Century conditions.
- Because they are modeling pathfinding processes and directions that follow from them.
- Because such pathfinding and direction-setting make it clear there are countless roles for integral consciousness, thinking, and practice in developing politics and the political, writ large.
- Because there are tangible actions, projects, analyses, deliberations, policies, conferences, and reframings of directions to embark on *now* and they can and should take many forms at all scales. Why?
- Because systemic change depends on getting politics and the political developing and to get *that* development humming at all scales.
- Integral thinking and approaches are essential to structuring systemic change, and can be supported by a new paradigm for understanding and applying integral criteria.

We express our deep gratitude to each of the authors published here for their generosity in sharing their work, and special thanks to Thomas Jordan who helped with editing this issue. We hope this collection plays its intended role in fostering development of politics and the political.

“Sweet Science”
A Proposal for Integral Macropolitics

Daniel Gustav Anderson[1]

Abstract: This treatise proposes the practice of becoming-responsible as a basis for integral micropolitics, defined as taking active responsibility for the well-being of the totality of living beings without exception, for the sake of that well-being alone. After reviewing two extant integral models for political action and interaction, demonstrating some of the limitations inherent in them, some ways are outlined in which the characteristic features of becoming-responsible—including critical clarity, compassion, competence, and consciousness—can be expressed in the realm of public concern; first, theoretically, drawing on a model proposed by poet and artist William Blake, and second, also historically, reflecting on an experiment in radical democracy in Chile (1970-1973), such that both examples critique and advance the claims and methods of mainstream integral theory as well as the alternative approach elaborated in this essay.

Keywords: Allende, Blake, Chile, democracy, integral praxis, integral theory, micropolitics, mimesis, politics, power, public sphere, responsibility, socialism, The Four Zoas, well being, Wilber.

Introduction

> The fact of enormous suffering does not warrant revenge or legitimate violence, but must be mobilized in the service of a politics that seeks to diminish suffering universally, that seeks to recognize the sanctity of life, of all lives (Butler, 2004, p. 104).

Problem Definition

In relating to others, it is better to be just than unjust. Socrates makes this argument throughout the *Republic*, and it is perhaps his most convincing one. But beings, classes, nations, corporations, and institutions profit and develop materially and socially by injustice to others in the *present* (in terms of labor alone, Marx demonstrates this mathematically in the first volume of *Capital*) and to others in the *future* (insofar as present profitable practices risk and exploit the existence of our species and others into the future), on the basis of division rather than integration, democratic control, or any sort of responsibility for the needs of the totality. *Politics, at bottom, becomes an ethical problem of relating to others of all species in good faith (at present and for the future.)*[2] A responsible approach to this is the problem I intend to explore in the present essay—how best to approach the practice of living among other beings and aggregates of beings such that an unjust order may be transformed and a just order may arise, delineating a proper *object* of responsibility for integral practice which has, thus far, tended to emphasize *subjective* states and lines of development (as self-realization or self-transcendence): practice for the sake of a public good, a concern for the integral wellbeing of an other and others.

Claim

My claim is that the conscious practice of taking responsibility for the well being of others, *for the sake of that well being alone*, gives a coherent and productive foundation for an integral approach to politics as an ethical problem in the public domain, and addresses an interconnected set of problems in mainstream integral models,[3] the demonstrable existence of irresponsibility in and of "higher powers," and worse, an implicit justification for an order that allows that irresponsibility to persist (a problem detailed in Anderson, 2006). Plato anticipates this as well, of course: Socrates' concern for the education of future generations, for instance, betrays a desire to take responsibility for a collective future by intervening in the present, transforming or developing that moment, through collective storytelling and spectacle-making (institutional and otherwise),[4] and assuming the probable arising of irresponsibility (necessitating a pedagogy, which is precisely a plan for mitigating irresponsibility, by helping others become-responsible).

---

[2] In this regard, the present inquiry should be understood as a form of ecocriticism—not as a rhetorical or aesthetic project (Bate, 2000; Garrard, 2004), but as a critical program for the welfare of life-systems in perpetuity.

Definitions

I begin with the traditional definition of political theory as that body of thought cognate to ethics concerned with the public good, of relating to others in and of collectives and institutions responsibly.[5] *Micropolitics* is the practice of becoming-responsible for an object, understanding the object for what it may be on the terms of its arising, persisting, and decomposing, and coming to appreciate and care for that object for the sake of its well being, be it oneself or another living being, a community or a world—in its totality.[6] I have proposed four characteristics for becoming-responsible in this context: becoming-critical, becoming-compassionate, becoming-competent, and becoming-conscious (Anderson, 2008). For the purposes of *macropolitics* or politics as such, a subject is tasked with responsibility for the development and potential transformation of *an object of public concern* such as a "public" as such (as a tyrant, an oligarch, or in a participatory way as a citizen in a democracy)—or is excluded from that responsibility, becoming a responsibility of another, "handing over" by virtue of life circumstance any control over the terms of one's future, or the future of one's community or nation in relation to others. Because this is an unjust relation—some, by accident of birth or life chances, have control over the lives of others who themselves have no control over the terms by which they must live—I assume it is better to ensure that all who are capable of becoming-responsible for themselves and for others find the opportunity to do so, which is to say, I assume the present regime of "uneven geographical development" (Harvey, 2000) to be unsatisfactory and in need of transformation. Specifically, I do not object to "hierarchy" as such or differentiation as such, nor do I assume unity or totality to be necessarily oppressive; I do have reason to object to the terms and conditions of the present order, the kinds and qualities of hierarchy and differentiation prevalent and possible now.

---

[3] For the purpose of this essay, I define "mainstream integral models" as those proposed by Ken Wilber or his followers, or any of Wilber's claimed theoretical antecedents, including Hegel, Aurobindo, or Gebser. This is not intended to be a comprehensive or exclusive category, but a provisional and expedient one. I do not claim to analyze these authors exhaustively, given the scope of this work.

[4] Plato's pedagogy is either problematic or in part satirical. Following the structure of Socrates's argument: because God is the author of good things but not bad things, children must be raised with a certain kind of faith or else the direct and observable presence of evil in what they have been instructed to see as a divinely ordered world may disturb them, complicating their development and disrupting the State (pp. 623-630). Jameson (1974) by contrast explicates Marx toward a utopian transformation of consciousness by means of engaging with the difficulties of life rather than a rejection or avoidance or enforced denial of them (p. 116).

[5] The concepts public, public sphere, and "counterpublic" are both necessary and vexed: necessary because any notion of political action is predicated on interpersonal communication outside the home or the workplace, positing (explicitly or not) a mediated space in which communication can occur; vexed because a public so defined has hardly been a homogenous reality at any time or place (Habermas, 1989; Ranciere, 1995; Berlant, 1997; Laclau & Mouffe, 2001;Warner, 2002; Butler, 2004; Fraser, 2009)—bracketing the yet more vexed questions of the kinds of subjects such a public may demand, exclude, or make possible, the mediation of discourses through institutions and private technologies, and the relationship of a public to the state form (and by homology the subject to citizenship). This essay may prompt such questions for future integral work, but it hardly seeks to resolve them.

[6] This principle is developed in detail in Gampopa (1981), Shantideva (1997), and Chagdud (2003)—the practice of *bodhicitta*. I explore the phenomenological, hermeneutic, and semiotic implications of being in a world among others in D.G. Anderson, 2008.

What does it mean for a subject or a collective to take responsibility for the transformation of an objective situation like this one? Recorded history shows again and again that simply *having* or *taking* responsibility is not the same as becoming-responsible as defined above. It is possible to be responsible for another *and* to exploit that other, behaving irresponsibly toward that other. It happens all the time, it happens a lot, and it happens over and over, repetitively, even—significantly—mimetically. Many, in positions of relative responsibility, are uncritical and incompetent; the regime keeping them in place is predicated on a lack of compassion and consciousness, as I have suggested (Anderson, 2008; compare section *Holarchy and Macropolitical Praxis*). The coincidence of becoming-responsible (a practice), with being responsible (the fate of having a position of responsibility for others), can be called *politics in good faith*, in which the subject is motivated to act or refrain from acting for the sake of the object, at present and for the future, to be helpful and to prevent harm. This is conscious, creative, self-critical work; it is authentic leadership (see section *Politics in Good Faith*). It is an upstream swim.[7]

But two other valences are possible. The first can be regarded as politics in bad faith, which Clausewitz calls "hostile intentions," and can be understood as will-to-power, the diagnosis of which may be Nietzsche's most useful conceptual contribution to an understanding of the condition of modernity. This is the exploitation of a divided order such as the one I describe above, in which a "higher" force directs the transformation of a "lower" one, which lacks agency, while the resources of the "lower" fuel the uncritical and mechanical sword-waving and self-indulgence of the higher. Clausewitz (1993) characterizes this kind of intervention precisely as "an act of force to compel or enemy to do our will" (p. 83). The second valence, to be distinguished from this structured relation of dominance and exploitation, is the infamous Hobbesean state of war, in which no one is responsible for anything, violence characterizes all transactions, growth and culture are impossible, and chaos wins the day. This last possibility will remain in the background of this inquiry.

Politics in good faith is earnestly to be wished for, to be worked for—a just sociopolitical order that makes an integral and non-parasitic development of the totality possible and actively encourages that development too. Politics in bad faith or a hopeless state of conflictual free-for-all are to be avoided. To advance this end, I present the following proposal.

---

[7] Since present circumstances are best understood as a product of multiple histories moving on the power of causation in time (Anderson, 2008), transformative leadership must work against this kinetic energy, or at least redirect it.

Plan for this Inquiry

These are ambitious intentions, appropriate to more than one book-length treatment. It would be impossible to deduce any of them exhaustively even in the generous space allowed for this essay. Further, the archive I have assembled in order to illustrate my point is an admittedly eccentric one; I have drawn from sources representative or emblematic of the problem at hand, ones that carry a certain kind of rhetorical force.[8] Even so, this is a long essay, but a principled (and not self-indulgent) one.[9] The imperative to show and suggest with appropriate nuance if not always demonstrate the logic behind the claims I make and significant points of departure for further inquiry[10] justifies the length. This seems a responsible compromise and appropriate to a provisional inquiry, a beginning: to make the broad strokes and the skeleton of the rest available for consideration, to evoke and when necessary provoke further thought. To facilitate reading through and around this essay, I have included numbered section headings which are cross-referenced where useful, and pointed back to the companion piece to the present inquiry (Anderson, 2008) at regular intervals.

The trajectory of this argument corresponds in a suggestive but imperfect way to the pedagogic sequence of the Four Noble Truths in traditional Buddhism: first defining a problem, then identifying its nature, proposing that the problem is not insoluble or inevitable or somehow a good (that an alternative way is possible and desirable), and pointing toward a practical method to address the problem. As an intervention, it begins with an analysis of two metaphysical models for integral politics—Karen Litfin's (2003) Wilber-inspired proposal for Aurobindian *evolutionary idealism* as a means for understanding the present sociopolitical order and as an imperative for transforming that order, and Wilber's (2000b) definition of the holon in holarchy, which I show to be *inherently* political, even in its ideological[11] disavowal of political significance. These metaphysical models, at least as Litfin and Wilber present them, prove untrustworthy. This leads to a proposal for an alternative model which is simultaneously integral and responsible as defined in (0.3), which I develop from a juxtaposition of two unlikely postmetaphysical moments: William Blake's prophetic epic *The Four Zoas*,[12] which develops a detailed conceptual and imaginative foundation for a responsible integral macropolitics, and the

---

[8] Here I follow the archival and rhetorical examples of Berlant (1997), Agamben (1998), Warner (2002), Sedgwick (2003), and Butler (2004).

[9] This follows from Gurdjieff's (1999) aphorism, "'If you go on a spree then go the whole hog including the postage'" (p. 35).

[10] I have drilled down into certain arguments in some detail to point toward questions that will be productive of future inquiry. For instance, in the course of my treatment of *The Four Zoas*, I identify in passing a foundational problem in Wilber's means of knowledge-production, and suggest that a postmetaphysical interpersonal ethics of alterity (as distinct from the ethical aspects of political theory proper) rather than identity or sovereign command may be developed from Blake's vision.

[11] Teasing apart the precise relationship between the terms *ideology*, *spectacle*, and *make-believe* in the present inquiry constitutes a point of departure for future inquiry.

[12] Blake published his work himself, on copper plates; the manuscript presents remarkable difficulties for any reader, and relies heavily on the work of editorial interpretation. Due to the peculiar nature of Blake's early printing habits, all citations to this text refer first to the plate number and the line of the poem as collated and resequenced in the Erdman edition (1982), so that line three of page two will be cited as (2.3). This practice allows for easier comparison to other editions of Blake's work. Also, citations to *Paradise Lost* refer to the book and the verse line, also for ease of comparison.

Popular Unity period of Chilean history (1970-1973), which gives a historical example with direct consequences both for the macropolitics I explicate from *The Four Zoas* and the metaphysical models I offer up for criticism.

The Four Zoas uses visionary space to imagine clearly how the inter- and intra-personal politics of Empire works—interventionary politics *par excellance*—and points toward a politics of responsible action. Then the inquiry moves from an imaginative and conceptual space into a material, historical field, Chile moving toward radical democracy. I find this experiment on principle if not in all details a responsible intervention, along the lines the proposal for a macropolitics of responsibility in *The Four Zoas* suggests. Further, the coup staged on 11 Sept 1973 by a "higher power" to reintegrate Chilean resources and resource management into a larger, deeper, and more complex regime was by the measure I construct from one of Blake's visions an irresponsible, undemocratic, counter-integral act of war, of "hostile intentions" as Clausewitz defines them—politics in bad faith. By contrast, following Wilber's prescription, one is compelled to claim that this coup was a moment of self-transcendence for Chile, insofar as it was reintegrated into the "superholon" of global capital and drawn forward in evolutionary terms toward the "telos" of that regime (a term of spiritual significance for Wilber). In this regard, Wilber's doctrine "flickers" or mechanically reproduces in its ontology the divisive and parasitic social and political order of which it is an artifact: late capital (or globalization or neoliberalism [Harvey, 2000]) and its "postmodern" cultural logic (Jameson, 1991). Wilber's evolutionary idealism is, *for the purposes of understanding and expressing politics*, an exercise in make-believe with potentially dangerous consequences, regardless of the theological and therapeutic value Wilber's model and the "orienting generalizations" on which it is premised surely has for those who choose to believe in it (a value I do not wish to dismiss or denigrate, only to recontextualize).

For the sake of argument, I assume that social institutions and social formations (the state form, the family, the corporation, and so forth) can be understood abstractly as though they are unitary and homogenous, as Wilber does—but not without some reservation. It suffices at present to suggest that the ambivalence on the nature of the state form and other social institutions in the present work and in Anderson (2008) is attributable in no small part to real contradictions in and of the state form under neoliberalism. Harvey (2000) summarizes one of these, on the state in relation to others and to "globalization" as an economic and political activity, with particular relevance to my argument on the homology between the structure of Wilber's ontology and political conditions under neoliberalism:

> The preservation and extension of state power is crucial to the functioning of free markets. If free markets, as is their wont, undermine state powers, then they destroy the conditions of their own functioning. Conversely, if state power is vital to the functioning of markets, then the preservation of that power requires the perversion of freely functioning markets. This is, as Polyani outlines, the central contradiction that lies at the heart of neoliberal political economy. It explains […] why the great eras of globalization and freer international trade have been those where a single power (such as Britain in the late nineteenth century or the United States after 1945) was in a position to guarantee the political, institutional, and military conditions for market freedoms to prevail. (Harvey, 2000, pp. 180-181)

Berlant (1997) considers this contradictory relation of “above” and “below” from another perspective, that of the absence of any meaningful public sphere as defined against private interests: personal matters not obviously of public concern such as the details of sexual practices, desire, and affect become contested, intensely, and made irrationally political and publicized under neoliberalism (pp. 1-24). The subject, like the state in Harvey’s analysis, is for Berlant an irreducible but functioning contradiction. Thus, the state, the subject, and the specific nature of diverse and changing social and political institutions will remain a convenient (if marked for future analysis) fiction of homogeneity and coherence in this essay. That said, I will distinguish for practical purposes between two sorts of social aggregates or formations: on the one side are mechanical formations, products of history such as a given state or corporation; this is to be distinguished from what I will call intentional communities, which are organized responsibly; the discussion that follows in major sections *Imagining a Postmetaphysical Macropolitics* and *An Experiment in Radical Democracy* assumes it is possible to transform an aggregation of the former kind into one of the latter through a certain kind of practice. Hershock (1996, 2000) develops this distinction in mythopoetic terms appropriate to this context. A dialectic prevails: a social agent methodically cultivates virtuosity, a kind of creative competence. Defined in contrast to the practice of “absorption into a featureless or universal consciousness along the lines of Indian yoga,” virtuosity functions “as a practical method for attaining improvisational excellence—a virtuosic ability to respond to any contingency or demand” (Hershock, 1996, p. 160). Part of this is to consciously transform one’s behavior and intentions toward others, forming through one’s self-performance “dramatic affinities among patterns of narrative movement” or “reciprocally meaningful confluence” (Hershock, 2000, p. 94), working in counterpoint or contradistinction to prevalent modes and mores rather than in imitation of them (developed at length in section *Imagining a Postmetaphysical Macropolitics*). These dramatic affinities themselves become a condition for cultivating virtuosity, as in “liberating conduct or concern with others, not in the privacy of meditative absorption” (Hershock, 2000, p. 97). This is not a Promethean or a consumerist project: it is about coordinated, collaborative work.

In the interest of full disclosure, I should also describe my own position. I am an American of working class origin, male, and of European descent. As such, I have surely benefited from the injustices I describe in this proposal socially and materially; I have also suffered from them. This can also be said for my nation, the United States of America, which has both materially benefited and suffered from the injustices it has participated in, but which also has remarkable history of disciplined efforts toward transforming those injustices, many of them successful in unexpected ways. This essay aspires to be another such moment of Americana of the latter kind.

Metaphysical Macropolitical Doctrines

Evolutionary Idealism

Evolutionary Idealism: Introduction

Karen Litfin’s (2003) proposal for an integral approach to global relations and macropolitical action represents an early and untested contribution, and is therefore most fairly understood as speculative—that is, intended to open a field for inquiry rather than to present a wholly authoritative, unproblematic project. Litfin’s evolutionary ontology attempts to make space (in my view useful, even necessary space) for transformative practice inclusive of spiritual disciplines in political theory, descriptive and prescriptive. This is a valuable contribution. The present analysis of Litfin's ontological model is designed to keep this space intact, in fact to predicate authentic transformation on the disciplined practice of becoming-responsible rather than the invocation of a long-discredited idealistic historiography appropriate to one aspiring to the position of a Hegel or a Dilthey—or in a different respect, an Engels (De Certeau, 1988).

The Claim of Evolutionary Idealism

Litfin finds the present global political order problematic, and attempts to diagnose a cause for this. She claims that "the global problematique is rooted in a mode of consciousness that is becoming increasingly recognized as dysfunctional" (p. 31); this mode of consciousness is taken to include cultural manifestations such as secularism (p. 30), "deconstructive postmodernism" (p. 31), reason (p. 36), and the scientific method (p. 37)—leaving faith, pathos, and emphatic declamation as legitimized means of knowing and knowledge-production[13] (see section *Mechanics of Make-Believe*). Litfin attributes the problems of late capital inclusive of the characteristic maldistribution of wealth between the global north and the global south (Smith, 1997) and the catastrophic ecological consequences of unmitigated capitalistic development (Burkett, 1999) to this worldview[14] (p. 31), which in her view is not a precarious existential situation for trillions of vulnerable life-forms (Agamben, 1998; Butler, 2004), but a monologic story now in the throes of a crisis of legitimacy (p. 30).

Litfin's solution to the problem of a dysfunctional paradigm she diagnoses, and therefore her proposal for resolving the global political-economic and environmental catastrophes she identifies, is to tell a new story.[15]

> Recognizing that the old story is out of synch with the world we now inhabit, we turn our attention to our individual and collective (un)conscious in order to decipher that story and move towards a new one that will entail new practices (p. 33).

Litfin calls this position *evolutionary idealism*, which she defines as "an integral view of the world as the unfolding of Spirit" (p. 32) and as "an integral worldview that understands the universe as a revelation or manifestation of consciousness, Spirit, or intelligence" (p. 33)—a position explicitly indebted to Aurobindo and Wilber, and an expression of Wilber's specific

---

[13] In terms of conventional public discourses, Litfin's approach is appropriate to theology and metaphysics. I recognize that there may be postconventional means of verification for a truth claim, but Litfin does not discuss these substantively in the context of her proposal for an integral macropolitics.

[14] Litfin's approach in this regard is not unique. For instance, Tarnas (2006) takes a similar position, arguing that astrological forces affect human consciousness in ways that then produce or determine workaday experiences.

[15] The totalitarian overtones of Litfin's proposal, in which the multitudes are to be reeducated (indeed to introspectively reeducate themselves) into the Correct Story, are surely unintentional; it would be unwarranted to attribute an explicitly totalitarian agenda to Litfin's project on these grounds.

Hindu-Hegelian synthetic theology, but attributed broadly (if incorrectly) to world culture generally.[16]

Arguments for Evolutionary Idealism

Litfin makes three arguments in favor of Spirit's reality and utility as a concept for the purposes of understanding and transforming global politics. Her first is that "much of both pre-modern Western thought and non-Western thought has accepted Spirit as the fundamental reality" (p. 41). For the present, the implausible claim that much of pre-modern Western thought and (depending on how one understands her meaning) *all* of non-Western thought (a remarkably diverse category of cultures and concepts) uniformly posits Spirit in the manner Litfin and Wilber do can be bracketed and left aside, because even if one assumes it for the moment to be so, it does not constitute a warranted and supported argument *vis a vis* contemporary politics; it merely recontextualizes (arguably marginalizes) Spirit into a large-scale historical or anthropological *artifact* of a premodern, superstitious past–or as an exotic, Orientalized *other*. Put another way: masses of people have affirmed and accepted the reality of many things that seem unacceptable at present; correspondence of contemporary concepts to practices of ancient cultures presents some difficulty methodologically for this reason. For instance, one may argue that many cultures in the past and in the "mystical" East have practiced slavery and believed in the benefits of slavery, and practiced misogyny and believed in the value of misogyny, and for this reason, contemporary problems can should be solved by the reinscription of slavery and misogyny into world culture. I very much doubt that Litfin intends to marginalize the core of her ontology, the reality of Spirit, in the manner that her first argument in favor of that ontology leads if pursued to its conclusion. This argument is best discarded.

Litfin's second argument in favor of Spirit: Hegel seems to have put his faith in it (p. 41-42). I suggest some ways in which this argument is immediately problematic in Anderson (2008); Marx's comment that for Hegel "*sense*, *religion*, state-power, etc., are *spiritual* entities" regardless of the objective actions taken by those powers or their means of subsistence (p. 111) anticipates several decades of scholarship on Hegel in this regard. In brief, neither of Litfin's first two arguments overcomes one major argument against Spirit as Litfin herself deploys it: if one accepts the claim that all contexts, including the present, are expressions of a Spirit that knows better than we do (Litfin, 2003, p. 41), then the crisis of the present should be understood in the first place as a consequence of that Spirit's demonstrable and necessary *incompetence* and *irresponsibility*—in Wilber's terms, because the "higher" holarchy has the greatest freedom to act, that higher holon, Spirit, must have the greatest freedom to act for the good of those holons under its aegis, which it has clearly *not* done, as the problematique of the present as Litfin diagnoses it proves. Spirit as Litfin proposes it is (in Wilberese) the *telos* of a *pathological superholon*[17] (see section *Retelling the Epic of the Superholon*). This argument, also, is best disregarded.

---

[16] Following Wilber, Litfin claims "the modern West became the first major civilization in human history to deny substantial reality to the Great Chain of Being" (p. 36). This is an unsubstantiated claim, and easily refuted with one of many historical examples, one being Theravada Buddhism. If one holds to Litfin's claim, one must then claim that Theravada does not represent a major civilization. A more productive approach may be to identify in history specific cultural artifacts that may have proposed a Great Chain of Being analogous in some detail to the one Wilber (2000b) posits. Finally, there is some danger in identifying evolutionary idealism with all spiritual traditions generally—it may lead one to conclude that criticism of evolutionary idealism amounts to attacking all spiritual traditions without exception, or spirituality as such.

All this points to two problems with Litfin's third argument in favor of Spirit: "The appeal of evolutionary idealism will then depend upon its internal coherence" (p. 50). First, internal coherence is useful—I aspire to it myself—but it does not alone verify a truth claim.[18] The example of the Flying Spaghetti Monster (Henderson, 2006) shows that a motivated individual with no special qualifications can improvise an internally coherent model for the intelligent design of the Cosmos[19]—no one confuses the Flying Spaghetti Monster with a verifiable existant, or accepts Henderson's explicitly satirical claim regarding the cause of global warming as science,[20] but both positions are acceptable theologically and perhaps useful to some for that purpose (on principle at least, even in a ridiculous case such as Flying Spaghetti Monsterism). Second, evolutionary idealism as Litfin presents it is not coherent internally, as I have suggested already. To give another example, Litfin claims that reason has overcome superstition in the West (p. 37), which compromises her later claim that Western culture is predicated on a superstitious cult of scientific materialism (p. 37), not reason.

---

[17] The logical necessity of an incompetent Spirit for one seeking to accommodate Wilber's metaphysical position while also accounting for the Terror of the present Situation (Gurdjieff, 1999, pp. 1184-1238) is not a problem unless and until one insists on trusting this incompetent Spirit or attempts to make it responsible for matters of public or personal concern. Wilber tends to do this. For instance, in one of the informal writings of his that he has chosen to make public Wilber asserts that "enlightened awareness […] alone knows how to proceed" with a method for addressing ecological problems, where enlightened awareness is equated with "One Taste" which is characterized as "Spirit itself" (Wilber, 2000a, p. 212).

[18] One may argue (fairly I think) that insisting on a description of reality that is free of internal contradiction assumes a *reality* that is without contradiction or explicably by reason without contradiction, or is even particularly "real." I assume instead that an argument in favor or against a particular view ought to be reasonable—that logically coherent arguments are qualitatively superior to thinly reasoned ones—and that one's premises ought to respond to the empirical contours of the object of one's analysis, such that a contradictory object will be presented as contradictory or at least paradoxical. My objection to these metaphysical models for macropolitics (those of Litfin and Wilber) is not the contradictions latent in their ontologies; experiences are contradictory, complex, paradoxical. Rather, I object that these contradictions are not explicit *as* contradictions, and that the arguments given in support of them are themselves contradictory and more than occasionally implausible.

[19] Litfin's description of Spirit connotes precisely this theology (Forrest & Gross, 2004) in that Spirit is posited as "an animating intelligence [that] underlies the development of not only life forms, but of all creation" (Litfin, 2003, p. 41).

[20] Henderson (2006) includes an elaborate riff exploiting a logical fallacy inherent in some arguments in favor of the teaching of "intelligent design" theory in American public schools in place of more trustworthy science curricula, specifically the assumption of necessary causality between two phenomena when only correspondence and no plausible causality can be demonstrated—suggesting that because there are fewer pirates on the high seas at present than in the nineteenth century, the decline in pirate population must be a cause of climate change in the diction of a corporation producing and selling commodities of conviction called the "Enlightenment Institute" (pp. 126-164)—a mashup of Wilber's Integral Institute and Andrew Cohen's *What Is Enlightenment?* magazine. Tarnas (2006) presents an argument related to the one Henderson (2006) critiques.

Evolutionary idealism is a coherent theological position and very likely a useful one for those who are committed to it, but as Litfin's argument elaborates it from subjective spiritual or mythopoetic speculation to objective macropolitics, concerned with lives lived among others in material conditions, her arguments for evolutionary idealism crumble into incoherence. This incoherence is compounded into a preposterous totalitarianism in Litfin's description of political praxis.

Praxis According to Evolutionary Idealism

Litfin's proposal for transforming the present sociopolitical order by invoking a "new story" is not without difficulty. One can argue that it is narrative of a particular kind that holds nations together in the first place (Anderson, 1991), often through *forgetting* significant details as much as remembering others (Renan, 1993), an insight that informs Great Books education as practiced in North America (Adler, 1956; Hutchins, 1954; A. Bloom, 1987)—a cultural matrix from which American neoconservatism arose at the University of Chicago (with the introduction of Leo Strauss's political science). *Story* is how power enforces certain values, sometimes through the figure of authors imagined as epic geniuses or timeless sages, as H. Bloom (1994) and Wilber (2000b) tend to present them (Foucault, 1977; Guillory, 1993; Eagleton, 1984; Michael, 2000). As Renan argues, in order to impose a story for the purpose of consensus consumption, the regime must ask that socius to forget or ignore certain things—to forget national embarrassments, humiliations, and mistakes. For instance, theological traditions often ask adherents to forget certain kinds of scientific evidence that invalidates particular theological tenets.[21] Readers of the *9/11 Commission Report* (2004) may or may not notice the total absence of any analysis of American foreign policy since the second World War, remarkable for a document committed to explicating an attack from abroad by motivated actors, but this is forgotten, arguably in the interest of reassuring a vulnerable national sensibility already convinced of the official story, that the terrorist attack was an assault on American *values* rather than American *power*. Apropos of "story," Garcia Marquez (1995) shows how this kind of forgetting can work in the global south—after the banana company (through its subsidiary, the state[22]) massacres thousands of striking workers, only Jose Arcadio (Segundo) Buendia and a random child caught in the moment are able to testify to the historical event. The others forget as if by magic, insisting on the veracity of the official story:

---

[21] Members of the LDS Church, for instance, must put their faith in the historical existence of ancient North American tribes such as the Nephites, Lamanites, Jaredites, and Mulekites, as recorded in the *Book of Mormon* (Smith, 1841) despite the lack of any archaeological or historical evidence to support their claimed existence. *This is wholly unproblematic as an article of faith*, as a metaphysical or theological position. Only when mistaken for scientific theory does this point of theology become contestable, and contested.

[22] The *9/11 Commission Report* (2004) claims that "the American homeland is the planet" (p. 517). This is at first blush a gesture of rote imperialism, but in a subtle way also expresses the subordination of the state to the regime or "telos" or "attractor" of global capital. Since the Bretton Woods Conference in 1944, the U.S. has been the capitol of global capital as it were, and its champion-in-chief—its main military exponent. The doctrine presented in the *9/11 Report* suggests, among other things, that the purpose of the American state is to defend, protect, and promote the strategic interests of capital *anywhere,* because defending these interests maintains the U.S.'s position in holarchy as evolving toward the protocols of the telos of global capital (to express my point in Wilber's diction—see section *Retelling the Epic of the Superholon*).

> "You must have been dreaming," the officers insisted. "Nothing has happened in Macondo, nothing has ever happened, and nothing will ever happen. This is a happy town." In this way they were finally able to wipe out the union leaders. (Marquez, 1995, p. 310).

The cost of Jose Arcadio Segundo's adherence to empirical fact is his necessary withdrawal from civil society and into a kind of mysticism. My point is that stories of the type Litfin attributes the world's problems to are not simple; they are institutionally and ideologically enforced (and as often theological and cultural as materialistic or scientific, contra Litfin's characterization of the present ideological moment); they are contested; they are not at all uniformly distributed, nor readily replaced.

Effectively, to impose a "better story" is to reinvent a web of nation and subject and global interconnection, inclusive of educational infrastructure (see section *An Experiment in Radical Democracy - Introduction*). It is not a matter of Providence so much as a matter of power, politics, and responsibility. As I have suggested (Anderson, 2008), some have control over the terms of their lives and some do not. The challenge is to democratize this. Further, as I show in (section *Holarchy and Macropolitical Praxis*) it is not at all clear that the new story Litfin proposes, insofar as it reterritorializes Wilber's evolutionary ontology into global politics, is in fact a new story at all. I agree with Litfin that the ideologies spun by capital are typically counterproductive, an argument as old as the Frankfurt School but perhaps positioned most creatively as presented by Debord (1995). However, I propose instead not to disseminate the content of a new narrative or a set of themes or a new paradigm, but (following *The Four Zoas*) to make possible the recovery of cultural memory from the top to the bottom of any stratified socius—democratizing the production of values and personal autonomy in a responsible way (Anderson, 2008). E.P. Thompson (1963), P. Anderson (1979), Ginsburg (1980), Braudel (1981, 1982, 1984), Shapin & Schaffer (1989), Buck-Morss (1991), LeGoff & Nora (1985), Gilroy (1993), Roach (1996), de Certeau (1998), Linebaugh & Rediker (2000), and Zinn (1995) represent divergent and sometimes conflicting approaches to this task,[23] the last recalling a bloody three-year war fought by American soldiers for control of the Phillipinnes and its resources, wholly forgotten in the mainstream narrative of American self-identification (pp. 305-306). Responsible historiography has the advantage of exposing the problems of accrued and contradictory ideologies for what they are, make-believe,[24] rather than risking a top-down propagandism passing as personally-meaningful "re-storying."[25]

---

[23] This selection of scholarship is not intended as a rhetorical gesture of canon-formation of the kind so characteristic of Wilber's rhetorical strategy ("from Aristotle to Spinoza, from Leibnitz to Whitehead, from Aurobindo to Radhakrishnan" [Wilber, 2000b, p. 116]), but as a practical syllabus for those motivated to address the question of how changes occur in historical time in integral and critical (not idealistic) terms.

[24] Karasu (1994) evokes the sense of this concept of make-believe precisely:

> People are increasingly satisfied to believe whatever they want to, or whatever they wish for; perhaps they are scarcely aware that they've left off reasoning, reflecting, attempting to see things as they really are. By the time they become aware, darkness will have set in (p. 11).

This context should be contrasted against the role of "attractors" in Wilber's metaphysics (section *Retelling the Epic of the Superholon*).

It is worth noting, finally, that Litfin reproduces Wilber's problematic post-Dilthey tendency to attribute broad social transformations to "worldviews" produced by conspicuous intellectuals.[26] For instance, Litfin claims that modernity has "architects," inclusive of "Descartes, Newton, and Locke" (p. 36)—that the predilections and methods of a shortlist of great men have produced the present complex of contemporary forms of consciousness, an implausible but familiar theory of determination (Foucault, 1977). Similarly, Wilber (2000b) argues that because early scientists chose as their object of analysis "the dumbest holons in existence," such as stones, reality as understood *in an everyday way, by everyday people*, has been reduced "to a flat and faded landscape *defined* by a *minimum* of creativity and a *maximum* of predictive power" (p. 56)—with Newton's analyses of matter as well as his arguably more systematic exegesis of Biblical prophecy (another kind of "predictive power") the unspoken subtext of Wilber's claim. This invites one to ask: are the findings and methods of individual seventeenth-century scientists, working on the edges of their culture's normative values (rather than representing them in an integral way), truly responsible for the contingencies of contemporary consciousness, in which people behave mechanically, view their worlds mechanically, and experience their lives with minimal creativity and maximal predictability? I suggest that another explanation may be more plausible: our social world, our work lives and political lives, have become structured such that minimal creativity is possible, that outcomes are maximally predictable—and further, that the regime or "attractor" in Wilber's diction of the prevalent social order works to reify and reinforce this mode of consciousness (see section *Retelling the Epic of the Superholon*), beginning with an unplanned social experiment born in England in the eighteenth century. This was the transition from seasonally-variable agricultural work and urban, industrial capitalism, first coincident with the arising of early science—a process that, in Gurdjieffian terms, derails healthy human development in order to make machines of people for the purposes of labor power for the accumulation of capital[27] or for consumption that drives the same (Marcuse, 1964). In short, I suggest that if one wants to understand the conditions and determinants of the day-to-day consciousness of people and the conditions of possibility for their future life chances, one would do better to look to their day-to-day lives (at work, in the family, in committed relationships) rather than to European and postcolonial intellectual history, which is useful for other purposes, particularly the practice of becoming-critical.

---

[25] This is the political significance of the opposition I assume throughout this essay between material history and degenerated or misapplied forms of mythopoetic speculation: responsible history reserves the right to be self-critical, which is to say, the right to being wrong and corrected.

[26] Ferguson (1990) gives a useful history of the arising of the concept of the "worldview" as a means for understanding historical transformations, as an expression of the psychological and social needs of a particular time and place but imagined as universal, as inherent, archetypal determinants of consciousness and its forms. Tarnas (1991) should also be understood in this context.

[27] In the *Manuscripts* of 1844, Marx (in the context of his discussion of alienation from humanity and nature) argues:

> [t]he savage and the animal have at least the need to hunt, to roam, etc.—the need of companionship. Machine labor is simplified in order to make a worker out of the human being still in the making, the completely immature human being, the child—whilst the worker has become a neglected child (p. 95).

Holons and Holarchy

Introduction

The "new story" Litfin proposes, the one she claims is identical in some regards to all ancient traditions, is Ken Wilber's ontology, which finds its first detailed elaboration in *Sex, Ecology, and Spirituality* (2000b). This section will recount the plot, so to speak, of Wilber's presentation of this ontology, in order to understand in some detail what the consequences of this ontology of *holons* (things) in and as *holarchy* (organization of things, structured relations in and among things) might be if used to interpret global politics, as Litfin has attempted. A challenge arises immediately, because Wilber expressly disavows reading social collectives such as nation-states, corporations, or ethnic groups in the same way as other putatively self-conscious phenomena[28] (for Wilber the category of the singularly self-conscious includes compounded or aggregated things such as atoms, rocks, and the cosmos at large) (Wilber, 2000b, pp. 72-73). I have argued elsewhere that this is a self-contradictory objection on Wilber's part (Anderson, 2008); further, I will show presently that Wilber himself identifies social or aggregated units as holons regardless of his advice against doing so, and further, that holons and holarchy as Wilber describes them represent with some accuracy global political phenomena, inclusive of relations of dominance, subordination, and actual injustice among global powers.[29] Litfin is very much justified in elaborating from Wilber such a politics. On these grounds I will retell Wilber's ontology *as it expresses these political units* in order to demonstrate the political significance of this ontology,[30] which coincide with the particular social regime (or in Wilber's terms, the "telos") it expresses, integrated global capital (Guattari, 2000). My purpose is not to explicate the flaws in Wilber's logic or demonstrate his misreadings of particular texts; such exegesis has been taken up elsewhere;[31] it is instead to suggest ways in which Wilber's holarchy flickers or mechanically reproduces in the field of metaphysics and spiritual aspiration the social and political structures of late capital, which are not integral at all.[32] Further, because Wilber's holonography reproduces the present political order and forecloses any legitimized means of transforming its problematic terms of exchange, the unevenness of its development (as I will show), one may plausibly claim that it is not a transformative model but a conservative one in the last analysis, where conservatism is understood as an attempt to maintain the status quo for its own sake.

---

[28] This does not prevent Wilber from assuming a kind of singular self-consciousness on the part of social collectives or units of analysis such as academic disciplines, generations, or social movements insofar as they express categories of value according to his adaptation of the vMemes of Spiral Dynamics (Wilber, 2003a; Wilber, 2003b).

[29] Harvey (2000), a geographer, observes that "[h]uman beings have typically produced a nested hierarchy of spatial scales within which to organize their activities and understand their world," concerning "[h]ouseholds, communities and nations" as "obvious examples" (75). Holarchy as interested hierarchal relations should be understood as a means of social organization in the first instance.

[30] Further, Mastustik (2007) argues for contextualizing Wilber as a critical social theorist in the tradition of Marx and the Frankfurt School. If Wilberian theory is to be regarded as wholly integral, a "theory of everything," it should account responsibly for social and political phenomena—and should be held accountable for the social and political consequences of its positions, if Mastustik's project is to be pursued.

[31] To cite an early example, Helmeniak (1998) offers a detailed treatment of the category errors, logical fallacies, and implausible claims in Wilber's foundational work, from a position much more sympathetic to Wilber's project than mine (pp. 213-292).

[32] W.I. Thompson (1998) points to this critique of Wilber (particularly in regard to mimesis and the near-totalitarian hyperbole of Wilber's authorial self-fashioning as expressed in the politics of his cosmology) (pp. 12-13), but does not develop it in a thoroughgoing way.

Retelling the Epic of the Superholon

Wilber (2000b) gives a series of characteristics that specify what holons[33] are, how they behave, and how they relate to each other. This foundational moment in Wilber's project is rehearsed in some detail to show its assumptions, functions, and consequences.

The first is the most basic: "*Reality as a whole is not composed of things or processes, but of holons*" (p. 43). Holons evolve relative to one another in a hierarchic fashion (itself evolving) that Wilber calls *holarchy*, such that all holons are both wholes as they are but also parts of a larger order. My hand is a whole hand, as it is; but it is also part of my arm, part of my body, and part of my work; my thumb is a whole thumb, but it is also part of my hand; each are both wholes and parts of other wholes. That is the logic of the holon as Wilber presents it, and to that extent, the holon is a remarkably useful and flexible concept.[34] Wilber argues, convincingly in my view, that it is reductive to see any given holon (a thumb, a hand, a body) as *either* a whole or a part; at any time, a holon is both a whole and a part (p. 43). This tendency toward reductivity and incompetence is a characteristic Wilber uses to distinguish "dominator" or pathological holarchies from "natural" ones; a dominator holarchy is a regime that "occurs precisely wherever any holon is established, not as a whole/part, but as a whole, period" (p. 45). This distinction proves to be problematic.

Holons, according to Wilber, are capable of at least four things: "*self-preservation, self-adaptation, self-transcendence, and self-dissolution*" (p. 48). The first two of these can be understood as agency or autonomy, on one side, and communion or interaction on another; taken together, one finds that holons are self-interested social actors, interacting with others for their own reasons. The second two, self-transcendence and self-dissolution, imply a potential for development and growth in opposition to decline and decay. In short, the holon lives an ordinary, mortal life among other holons. Wilber extends the third capacity listed here, that of self-transcendence or creativity, into another characteristic: "*Holons emerge*" in the context of other holons that, to a greater or lesser degree, condition or even determine that holon's trajectories (p. 54)—one might say its *life chances*. According to Wilber, "determinism arises only as a limiting case where a holon's capacity for self-transcendence approaches zero, or when its own self-transcendence hands the locus of indeterminacy to a higher holon" (p. 55). This begs at least two questions: Under what circumstances might a holon's capacity for self-transcendence approach zero? And under what circumstances does something or someone capable of self-transcendence pay out to an external agent or a higher power its own potential for future development, its "locus of indeterminacy"? Under a foreign invasion or occupation, a nation-state indeed becomes subject to the self-interested determination of a "higher" power, a possibility Wilber explores next.

---

[33] As a historical matter, the holon as a unit of organization is analogous to the scale holism (homology of microcosm and macrocosm) discussed at length in Plato's *Timaeus*.

[34] I express this function of the holon as a concept for explaining a given thing through the concepts *coherence*, *articulation*, and *totality* in Anderson (2008).

This kind of imperialism, and the potential for pathology or domination inherent in it, gives some significance of the fourth characteristic Wilber assigns the holon, that each one emerges "*holarchically*" (p. 56). This is because, according to Wilber, "[e]ach deeper or higher holon embraces its junior predecessors and then adds its own new and more encompassing pattern or wholeness" (p. 56). Thinking politically, two consequential interpretations follow from this. First, one must deduce from Wilber's premises that an imperial holon must be more integral, more whole, more complex, and arguably closer to Spirit than the holons it absorbs into itself, insofar as it reterritorializes those holons into a "more encompassing pattern," a deeper structure. Second, one must conclude that disengagement from a superholon is a counter-evolutionary, counter-novelty, and counter-integral gesture, insofar as the disengaging holon becomes of itself less deep and less complex. A *coup d'etat* or a hostile corporate takeover could be interpreted as a self-transcendent, evolutionary, even spiritual event, then, if it serves to accumulate depth and complexity, to hold the totality together; a postcolonial drive for democratic home rule would be the opposite (see section *An Experiment in Radical Democracy*). This returns Wilber to his distinction between pathological and "normal" holarchies. In the case of the former, "one holon usurps its position in the totality" (p. 58), a part claims to be a whole, reducing the rest of the whole to a part of itself;[35] by contrast, the latter regime expresses "the natural interrelations between holons that are always both parts and wholes in horizontal and vertical relationships" (p. 58). Litfin's "problematique" arises here as the pressing question *par excellance* of global politics: is capital as it has imposed itself on totality of the planet[36] a "higher," normal, natural holarchy or a pathological but normalized, naturalized, even spiritualized holarchy? Wilber moves to address this relationship between higher and lower, and the transcendence of the lower by the higher, by reference to Hegel.

Litfin's invocation of Hegel may have its roots in Wilber's explicitly Hegelian (and implicitly theological) interpretation of holarchic time, as expressed in the fifth characteristic of the holon: "*Each emergent holon transcends but includes its predecessors*," or, worded differently, the emergent holon "*preserves* the previous holons themselves but *negates* their separateness" (p. 59)—the agency that had characterized each holon becomes at best subject to the agency of another holon[37] volitionally as in the case of the masochist's contract,[38] or at worst, is wholly negated, handed over to a "higher" power regardless of the nature or intention of that power. The subaltern does not speak or act for him or herself (Spivak, 1988). Tellingly, Wilber's example in this instance is a sociopolitical one: the Kingdom/Republic of Hawaii slowly becoming integrated[39] into the United States (p. 60). For "lower" holons such as Hawaii, the Navajo Nation, the Philippines, Chile, Iraq—are the terms of Empire "communion" for the sake of development as Wilber suggests it must be in all possible realities (p. 60), or rather simple defeat, surrender of agency for no mutual gain, be a historical possibility in some cases, or some mix of both with costs and benefits evenly or unevenly distributed in the totality? Wilber attempts to mitigate this problem with a rhetorical strategy Blake parodies extensively (see section *Imagining a Postmetaphysical Macropolitics*), *doublespeak*: "the new and senior pattern or wholeness"—an oxymoron read literally—"can to some degree limit the indeterminacy (organize the freedom)"—two more oxymorons—"of its junior holons" (p. 60). This means *might*, expressed as *height*, makes *right*. The meaning of "right" here is fulfilled below in Wilber's discussion of "attractors," having to do with the ultimate significance of evolutionary change in Wilberian doctrine.

---

[35] As Urizen does early in *The Four Zoas*—see section *Mechanics of Make-Believe*.

[36] See Lenin (1967), Luxemburg (2003), and Aglietta (2000).

[37] This poem is the epigraph to an essay by Franklin Jones (cited as Da Free John, Da Avabhasa, or Adi Da in Wilber's writings), "The First Word," which is reproduced in many of Jones's publications as an introduction: "Do Not Misunderstand Me—/I Am Not "Within" you, but you Are In Me,/and I Am Not a Mere "Man" in the "Middle" of Mankind,/ but All of Mankind is Surrounded, and Pervaded,/and Blessed By Me" (Da, 2004). This is, clearly, a theological statement. Its expression of the guru-disciple relationship is a theological antecedent of the superholon-subholon, higher-lower relationship Wilber posits in his ontology (immediately recognizable if one substitutes "higher" for "I" and "Me," and "lower" for "you" in Jones's poem), where any holon's development or self-transcendence is here reterritorialized into a top-down Providential mechanism, insofar as "[t]he higher embraces the lower, as it were, so that all development is envelopment" (Wilber, 2000b, p. 59). That is: Wilber's ontology, and by extension the rest of his theoretical project, repeats or mimics this theological gesture, the devotional foundation of the religion of Adidam. I do not intend to affirm or negate the theological validity of Jones's claim; rather, I intend to suggest that, true to its New Age roots (Ross, 1991), *some of what Wilber presents as scientific theory* should best be characterized as *an expression of a specific theology or desire* instead.

First, however, Wilber develops the properly political aspects of his Kosmic theory of right. The sixth characteristic of the holon and the significance of limiting the indeterminacy as Wilber invokes it has much to do with natural resources—physical ones, such as petroleum and minerals, but also human labor power and creative productivity in work: "*The lower sets the possibilities of the higher; the higher sets the probabilities for the lower*" (p. 61). Consider petroleum: the industrial North, a deep superholon aggregated of many levels or layers of subordinate microholons, is limited by the pace and volume of oil it can extract from those subordinate petroleum states and contracts in Asia and Africa ("lower" and subordinated holons), the global South generally; the terms of that extraction, the laws ("probabilities") are established for the petrostates by the "higher" superholon (Karl, 1997). Wilber claims, "even though the higher level 'goes beyond' a lower level," within a holon that is among other things a whole that contains as parts other wholes that are organized as levels, "it does not *violate* the laws or patterns of the lower level" (p. 61). This is a debatable truth claim because, as the fifth characteristic pointed out, the laws of lower-level subordinates are "organized," under capital literally established in the first place, by the "higher," as in the case of the so-called Seven Sisters (Samson, 1975), sometimes by explicit violence if implicit violence fails (Kinzer, 2003).

The next two characteristics are concerned with depth (seven), and the accumulation of depth (eight). As suggested earlier, a deep holon has more levels, while a shallower one has fewer levels: "it is not merely population *size* that establishes order of richness (or order of qualitative emergence), but rather *depth*" (Wilber, 2000b, p. 64). And depth has qualitative value for Wilber, insofar as "*[e]ach successive level of evolution produces GREATER depth and LESS span*" (p. 64, emphasis in the original). This is the evolutionary idealism Litfin invokes, in which the deeper holarchy demonstrates its evolutionary and therefore spiritual superiority by that very

---

[38] The masochist effects a transformation in himself by first establishing a program, and then negotiating that program's execution. For this reason, masochism may be a useful site for considering power differentials as they relate to transformational dynamics, self-fulfillment, and justice (Deleuze & Guattari, 1987, pp. 149-166; Deleuze, 1991).

[39] The historical analysis of this event Kinzer (2007) presents confirms my interpretation of the imperialistic implications of Wilber's metaphysics.

depth—as though the deeper holon inhabits a different kind of evolutionary time, relegating the colonized holons in a permanent past relative to the empowered or "higher" ones—hardly a responsible form of knowledge-production (Fabian, 1983). This establishes the criterion for distinguishing the "rightful place" of one holon among others in holarchy—its depth, its level. The natural place of a holon is where the higher power or "telos" of its moment in evolution has put it, precisely where it is (a circular argument). Further, this position evokes Wilber's earlier suggestion that an imperial holarchy is by definition more advanced developmentally by evidence of its greater depth, differentiation, and complexity. In Wilber's words: "*The greater the depth of a holon, the greater its degree of consciousness*" (p. 65). But Empires are fragile and fraught to the degree they are *profound*. As Wilber observes, "[t]he greater the depth of a holon, the more precarious is its existence, since its existence depends also on the existence of a whole series of holons internal to it" (p. 64)—thus the documented ruthlessness of the superholon in securing from its subordinates the resources it believes it needs to ensure its survival and continued hegemony, which it also believes it needs.[40] Global capital, the deepest mundane superholon at present, is by degrees more conscious (and implicitly closer to Spirit) than any one of its subsidiaries by this model. For the purposes of the global South, global finance must be God; as for me, my employer must be my guru, as a leader in a higher level of an institutional hierarchy that subordinates me, organizes my freedom, and profits from my labors, regardless of Heaven's "heights" or the "depths" of my soul (Wilber, 2000b, p. 66)—a thought experiment Wilber will later entertain, in discussing the twelfth characteristic of the holon.

Wilber next offers a diagnostic for determining the relative depth of a holon within a holarchy for the ninth characteristic: "*Destroy any type of holon, and you will destroy all of the holons above it and none of the holons below it*" (p. 69). This recalls one of the better developed propositions of Marxism, by which meaningful democracy (in the sense of full enfranchisement across all contexts) in the form of socialism is only possible after the full development of industrial capitalism (Rader, 1979, pp. 120-129); following this, if one were to remove the possibility of capitalist development, one thereby makes impossible the development of radical democracy, thus proving on Wilber's terms either that a flattened, egalitarian socialist order must also be a deeper, more differentiated, and more evolved regime than late capital, the problematic of the present—or that Wilber's diagnostic is fallible. Perhaps more significantly, Wilber's model of evolution assumes a sequenced, single-voiced or "epic" teleology (Bakhtin, 1981) that seems to elide the possibility of coincident development on multiple lines in different contexts without reference to the One of Godhead, generally preferring the "higher" One to the "lower" multiplicity (both of which being necessarily nondual—see Anderson, 2008 and section *Time and Telling*), such that the lower holons on which the higher One or ones subsist become relatively less meaningful; "the more fundamental a holon is, the less significant it is" (Wilber, 2000b, p. 70). Following this, and recalling Wilber's earlier example of the absorption of the Kingdom/Republic of Hawaii into the United States (and into global finance), Wilber would need to claim that native Hawaiian lifeways and other resources must be less significant than American macroculture (presumably the spectacle [Debord, 1995], since Hawaiian folkways were not integrated wholesale into all regions of American economic activity or folklife uniformly) and needs (perceived or real) of the early and middle twentieth century (arguably as early as 1893), a difficult claim to justify qualitatively.

---

[40] The School of the Americas and Operation Condor are two integrated, conspicuous, and well-documented examples of this (Lopez & Stohl, 1984; Gareau, 2004; Gill, 2004; Kornbluh, 2004; McSherry, 2005; Dinges, 2005).

The tenth characteristic, "*Holarchies coevolve*" (p. 71), is significant methodologically for Wilber, because "the 'unit' of evolution is not an isolated holon (individual molecule or plant or animal) but a holon plus its inseparable environment" (p. 71). Regimes evolve; the by-stages of historical evolution of capitalism summarized by reference to corresponding stages in integral theory in Anderson (2008) is a conspicuous example. Manufacturing practices may migrate from Michigan to Manchuria or Mexico, but in any of those sites, the class differential (some control and direct the labor of others, buying that labor from them with wages, where subsistence can only be *purchased*) and the profit motive are reproduced. Wilber accounts for the possibility for formal circumstances to change, while structured relations of dominance persist not in spite of those changes but *by means* of those changes (which serve to keep the status quo intact) (Aglietta, 2000)—and Wilber's accounting of this tendency in capital becomes part of his model of reality at this moment. A trait of capitalism, a historically contingent and unnecessary regime, is given ontological significance by Wilber's holism. The eleventh characteristic of the holon reifies this class separation that capital both reproduces and depends upon: "*The micro is in relational exchange with the macro at all levels of its depth*" (p. 73). This means that global regimes produce local formations, which in turn reify global regimes, in part through the consciousness of those subject to this causal loop;[41] "as holons evolve, each layer of depth continues to exist in (and depend upon) a network of relationships with other holons at the same level of structural organization" (Wilber, 2000b, p. 74). Wilber presents here a broadened purview for on an old claim, that of class consciousness. According to Lukacs (1967), "class consciousness consists in the fact of the appropriate and rational reactions 'imputed' […] to a particular typical position in the process of production" (p. 51), which is to say, one's consciousness is conditioned by work and work among others in the same position or "level" relative to the superholon that subordinates them (in this instance, that of capital). Lukacs observes, however, that this is not always obvious; one of the functions of ideology is to transform a subject's understanding of social phenomena that are wholly contrived into naturalized, normal, even spiritualized *realities*; in Lukacs's (1967) words, "[t]he division of society into estates or castes means in effect that conceptually and organizationally these 'natural' forms are established without their economic basis ever becoming conscious" (p. 57), because if this basis were to come to consciousness, the "pull to pattern" Wilber identifies with ideology (to anticipate the story) would risk disintegration. Presently, this is increasingly articulated as a multitude against Empire (Hardt & Negri, 2004) constituted by beings with little in common culturally or historically except a subaltern position in the "depth" of holarchy—the same "level," as Wilber expresses it.

Wilber concludes his narrative of evolutionary idealism on the topic of spirituality, unambiguously inscribing the ontology he builds into the Providential scheme suggested by the Hegelian speculation latent in his sixth characteristic of the holon. Wilber claims that "Evolution has directionality" (p. 74), which implies increases in "complexity" (p. 74), "differentiation/integration" (p. 75), "organization/structuration" (p. 78), "relative autonomy" for the superholon, such that "the greater the depth of a holon, the greater its relative autonomy" (p. 78), and "telos" (p. 81), a concept Wilber develops at length: "the end point of the system," its deep structure,[42] "tends to 'pull' the holon's actualization (or development) in that direction" (p. 81). These "attractors" or end points are "examples of the regimes or organizing forces of social holons and their inherent teleological pull to pattern" (p. 82). "Regime," "telos," and "organizing forces" are *ideologies* (Anderson, 2008), or the "political unconscious" of a given social order (Jameson, 1982). Wilber speculates that "God may indeed be an all-embracing chaotic Attractor" (p. 85)—which is to say, God may well be the political unconscious, the regime, the *ideology* of that order. Wilber's speculative God, in this instance of consumer capital, is functionally a comprehensive marketing and human resource management strategy. Turned around: Wilber's view of God and Kosmos in this instance is in his own terms a code (attractor, regime) that expresses this ideology, and arguably serves that regime which in Wilber's view holds the holarchy together in an embrace[43] (the nature and value of which is explored in sections *Imagining a Postmetaphysical Macropolitics* and *An Experiment in Radical Democracy*). This means *there are no "pathological holons" except in resistance to the ideologies, regimes, "attractors"* (any one of which or the aggregate of all *might* be God) *that keep the superholon whole, intact, and functioning*. Because depth is good, and increasing depth is good, the dissolution of depth any hypothetical withdrawal from the superholon implies is by definition a counterdevelopmental, counterproductive, counterintegral gesture in Wilber's terms. Here, I think Wilber is fundamentally wrong, dangerously so.

---

[41] As Marx expresses this position in the *Manuscripts* of 1844, "the *social* character is the general character of the whole movement: *just as* society itself produces *man as man*, so is society produced by him" (p. 85).

Holarchy and Macropolitical Praxis

Wilberian holarchy is inherently political insofar as it is concerned with the relations among beings who are subordinated to others, such that those higher in the bureaucratic order, the superholon and its telos, are necessarily responsible for the development and well-being of the lower, while the lower is in possession if not control of resources needed to maintain the order by which the higher is higher and the lower, lower. That is: the superholon becomes responsible for those subject to it, and uses the resources of the totality (its labor, its creativity, its resources necessary for continued existence) for its own purposes, the accumulation of capital, or complexity, or depth, in this sense planting its banner in the dirt to claim the whole for itself as part of the whole. The empowered subject makes objects of less-powerful subjects—a perverse object of responsibility—rather than relating to other subjects as coherent others in their own terms.

Parenthetically, Wilber's most explicit public comments on interventionary politics—his unfortunate[44] post at the Ken Wilber Online website, "The War in Iraq" (2003b)—does nothing to contradict this analysis, although here Wilber works from different premises, specifically his muddled and contradictory iteration of Spiral Dynamics. Wilber assigns to a "second-tier" value system on which a utopian "World Federation" would be established, the task of preventing "any first-tier memes from dominating, attacking, or exploiting any other populations," equating "memes" and "populations" (which are quantitatively and qualitatively different things) in the process. Parenthetically, according to Spiral Dynamics this imperative to prevent bullying and allow all subordinated voices to be heard would be read as a manifestation of the "green" vMeme, not the "yellow" one Wilber assumes it to be.[45] Wilber then claims that all "orange or higher" political structures (where "orange" is ambiguously defined either as capitalism proper or as the value system of capitalism) anticipate this and are already functionally "second-tier" themselves. This means that the hegemonic order of the global north, which Wilber catalogues by name—"Germany, France, America, Britain, Japan"—integrated global capital, the "orange" value system, is already "yellow" or integral.[46] This confirms the previous interpretation of Wilber's holarchy in that structures claimed as relatively more evolved or "higher" are actually spiritualized expressions of contemporary global power dynamics, as of the second Bush administration—that Wilber's metaphysics are in one sense a representation of contemporary social and political relations mapped onto subjective and objective *space*.

---

[42] Wilber's adaptation of tree-diagram Chomskian linguistics—surface structures and deep structures (p. 68)—should be contrasted against Deleuze and Guattari (1987) on the rhizome (pp. 3-25), which directly critiques Chomsky on this point.

[43] The imperative here is to offer one's volition upward to a more evolved, deeper organ, which then takes responsibility for one's transformation and self-transcendence. By contrast, I follow Shantideva (1997) and Chagdud (2003) in proposing that one's volition should be intentionally devoted in all directions toward the recognition of the needs of others.

[44] This document is riddled with non sequiturs, ad hominems, unwarranted evidence, contradictory terminology, misattributions, and shrill rhetoric. Its claims are advanced exclusively by forceful

It also corresponds to another trend in Wilber's writings: when he does endorse a coherent political position, it tends to be a neoliberal, pro-interventionist (or anti-anti-interventionist), even reactionary, position. Berlant (1997) offers a political context for the non sequitur expostulation against the "hypocrisy" of American protestors against the Vietnam war, inclusive

---

declamation and emotive appeal (see sections *The Claim of Evolutionary Idealism* and *Mechanics of Make-Believe*). For this reason, I will refrain from critiquing it as if it were a serious work of scholarship, only as an artifact that confirms findings already established in Wilber (2000b). To give but one example: Wilber claims that Tony Blair cannot be accused of "defending his oil interests" as a rationale for his unquestioning support of Nixonian intervention in Iraq because the U.K. is a net exporter of petroleum—forgetting or ignoring the longstanding investment of British capital by profitable British firms in Iraq, beginning with the very creation of the Iraqi state by the British for the purpose of these oil rights under the British Mandate for Mesopotamia, after the division of the former Ottoman Empire by northern powers (Samson, 1975) that was disrupted by Saddam Hussein's nationalization (but not socialization) of the oil industry. Wilber's historical claims on Blair are thoroughly discredited by the 2002 Downing Street memos (Danner, 2006).

[45] Wilber's application of Spiral Dynamics replaces arguments and proposals for and against different values or methods which are qualitatively heterogenous with a color-coded, systematized rubric of value systems or "vMemes," which are qualitatively homogenous. This move leads Wilber to equate all work in humanities disciplines as "green" or "boomeritis," inclusive of rigorous analysis of the type Jurgen Habermas practices (to emphasize a Wilberian favorite) and the uncritical speculation on popular culture Wilber parodies as self-indulgent gabbing about unimportant things (Wilber, 2003a). If both are green, then both are "first-tier," and therefore one is not more or less useful or valuable than the other by the logic of Wilber's adaptation of the Spiral—clearly an untenable position.

[46] It follows from this that Allende's move away from "orange" patterns of domination, which according to Wilber are somehow "yellow" patterns of integration, toward local control and a flattened, democratized social space, could be interpreted as an instance of the domination of "blue" nationalism over international "orange" property claims, justifying an "orange" intervention to "curb" this project (see section *The Endgame; Or, Limiting the Indeterminacy*)—just as Bush's actions serve to curb "red" terrorism, according to Wilber (2003b).

of bourgeois dilettantes who joined in for their own reasons, aired in Wilber (2003a, pp. 60-61) with no rebuttal):

> The antiwar, antiracist, and feminist agitations of the sixties denounced the hollow promises of the political pseudopublic sphere; then, a reactionary response grew dominant, which claimed that, in valuing national criticism over patriotic identification, and difference over assimilation, sixties radicals had damaged and abandoned the core of U.S. society. (Berlant, 1997, p. 3)

Wilber's sentiments, voiced by Fuentes (an instructor at the fictional Integral Center), identify him wholly with that reactionary response.

To return to holarchy, the practice of any regime may be critical, compassionate, competent, and conscious—it may be responsible—but it is not *necessarily* so (and even if it is irresponsible, it is still spiritualized for Wilber, it is still maybe-God). My retelling of Wilber's holarchic story suggests some ways in which it may be abused by an irresponsible regime, insofar as it is an accurate, spiritualized representation of what Litfin (2003) accurately diagnoses as a problematic political order (Anderson, 2008). The evolutionary-idealist picture Wilber paints and Litfin evokes may be a valid one on theological grounds; it may be useful therapeutically in some contexts; it has a certain appeal aesthetically. It is not unproblematic, however, and its problems (particularly as regards social and political applications) are such that an altogether different theoretical approach from it (Anderson, 2008) is in my view a more efficient and plausible beginning than the alternative of reconsidering or revising the evolutionary-idealist position to account for those problems.

Worded differently, this analysis of Wilber's ontology is only concerned with its practical application as social and political theory. I make no claims regarding its validity or veracity as a specific theology, however, a theology that claims to coincide with some trends in contemporary science. Wilberian metaphysics is not unique in this sense, either; the theology of Joseph Smith Jr., for instance, was consonant with certain emerging trends in the social sciences of his moment, such as Ethan Smith's *The View of the Hebrews* (1823). I do not wish to dismiss *belief* in evolutionary idealism.[47] Rather, my purpose here is to demonstrate the value of a rigorously postmetaphysical integral project, open to a spectrum of doctrines and metaphysics but not predicated on any one of them, for the purposes of social and political action (Anderson, 2008) relative to the problematic, divisive, and unjust social order implicit in *this* particular theology.[48] Toward this end, I explicate a more conspicuous postmetaphysical project, Blake's vision *The*

---

[47] In the diction of Wilber's comments on Iraq, I want to propose that an authentically integral space is one in which no theological project is permitted to dominate any other one—and that an authentically integral theory will, by necessity, be nontheological, in order to accommodate all possible theologies (Anderson, 2008).

[48] If all major spiritual traditions affirmed Spirit in the way Wilber does, as Litfin (2003) argues, then this critique of Wilber's theology would be directed to all major spiritual traditions—it would, in effect, be an argument against theology as such. This is not the case. Since I reject the claim that they do, I also do not claim that this critique of Wilber's theology has any necessary implication for any theology other than Wilber's.

Four Zoas, that is explicitly informed by and articulated in the language of dissenting Protestant theology (see section *Imagining a Postmetaphysical Macropolitics*).

Conclusion to Metaphysical Macropolitics

In sum, when Litfin (2003) proposes to replace the current pathological story with a more comprehensive, meaningful, and constructive one, she effectively reproduces the old order in a bigger, more absolute context. The task remains to identify some means for introducing a legitimately new course of action. I find that an old source may have something new to offer for an integral theory of political action: Blake's masterpiece, *The Four Zoas*, which proposes a wholly different view of political responsibility from Wilber's evolutionary idealism, in which the multitude becomes-responsible for the totality as an act of goodwill to an other taken seriously as an equal, not as an imperialistic act of envelopment and disenfranchisement. The subaltern sings, slavery of all kinds is abolished, and ordinary beings find responsible, "virtuosic" ways to organize their own freedom in *The Four Zoas*.

Imagining a Postmetaphysical Macropolitics

"Just as philosophy begins with doubt,
so also a life that may be called human begins with irony."[49]

Introduction to *The Four Zoas*

Before proceeding, a qualification: the question of Blake's politics (or rather, the coherence of the political gestures identified with the author William Blake) represents a longstanding division in Blake scholarship. This can be summarized in a rough-and-ready way on one side by Damon's (1965) compaction of the Blakean complexity to a Jungian personal metaphysics, historically favored by readers seeking to recover a *private*, transcendent mysticism from Blake's writings (symptomatically from the static nationalism of *Jerusalem* the epic and "Jerusalem" the lyric) and on the other side by Erdman (1969) and on more explicitly normative grounds by Thompson (1993), recuperating Blake not as a God-and-country introspectivist but as a "prophet against Empire" aspiring to a *public* intervention. Neither position represents the totality of Blake's oeuvre without serious qualification or outright contradiction, like the angels and devils mistaking their limited points of view with an absolute or complete narrative of right (though Blake typically sides with the "Satanic" position) in *The Marriage of Heaven and Hell*. I find both approaches wanting and the enterprise of constructing a unified and unproblematic author-function unwarranted, counterproductive, and cultish (Foucault, 1977). I propose instead to read *The Four Zoas* not as the timeless expression of an Important Author's good judgment

---

[49] This is Kierkegaard's main claim in *The Concept of Irony* (1989), an important contribution to the development of Rorty's concept of a postmetaphysical culture, a concept Wilber has consistently claimed as his own (Anderson, 2008). Arguing directly against an aspect of Clark's (1991) analysis (in her comparative study of Blake and Kierkegaard), I find there are ways in which Blake can be understood to be concerned with questions of "community or human 'solidarity'" (p. 109), but I agree with Clark that such a solidarity is not in the last instance premised in the traditional way on identity or adherence in *The Four Zoas*.

(necessarily eschewing at the same time any self-aggrandizing pretense to be, myself, a Respectable Expert on said Important Author), but as an artifact of a particular time and place when democratic alternatives to nascent capital were lived realities. Linebaugh & Rediker (2000, pp. 344-351) locate the text in a period of Blake's career when he publicly identified and interacted with active republican and anti-slavery causes, calling for the freedom and enfranchisement of all (and not only the English, as his later work implies). It is not implausible to suggest that Blake's most involved work of this period included in it a still-relevant critique of a social order predicated on impressments and slavery, and a vision for an alternative emerging from that critique. My claims on *The Four Zoas* are not intended to be last-word authoritative or to account for all of Blake's writings—I do not seek to ventriloquize Blake or any other now-fetishized sage of the canon, or to recuperate an "integral" canon—but they are suggestive of a properly integral political vision itself largely unencumbered by the desire for authoritative final answers from singular Great Minds.

In contrast to Wilber's idealism, Blake's transformational project as presented in *The Four Zoas* is primarily temporal rather than spatial or structural. It proceeds in three discrete steps. First, a static, pathological hierarchy kept in place by make-believe and mimicry[50] motivated by unchecked and irresponsible will-to-power is established, and the nature of that pathology is explicated psychologically and domestically; then, the poem introduces a surprise that disrupts this hierarchy and temporarily makes of it a smooth, organless state, after which a new set of values is introduced.[51] This proves to be a bottom-up, rather than a top-down, transformation.[52] Since this is not a conventional way to read *The Four Zoas*, each of these steps is recreated in detail below with references to the Wilberian gestures discussed above in section *Metaphysical Macropolitical Doctrines*.

Time and Telling

The Four Zoas is a paradox: a Big Book,[53] an integral project, on the limitations of Big Books and a fully-elaborated all-quadrants, all-lines integral theory.[54] The poem earnestly courts comparison to *Paradise Lost* by its frequent and explicit allusions, showing a concern for being received in the context of epic and in contradistinction to Milton's imperialistic theology (Evans, 1996). Many of the poem's nonparodic features mark it most conclusively as such: it more-than-encyclopedic scope, its exoticism, and its unity of form, manifested by means of an elaborate and symmetrical ring composition. Ault (1987) has mapped in close detail the symmetrical and pseudo-symmetrical patterns of mirrorings, repetitions, and embeddings by which Blake structured the poem. According to Ault, each Night constitutes a ring composition, as does the entire poem; further, the first three Nights taken together mirror the last three taken together, constituting a point of contact with the wholeness/partness condition of the holon as Wilber describes it. More interestingly, patterns of repetition (with difference), a familiar Kierkegaardian theme, give a feeling of mechanical, top-down inevitability to the events of the poem, against the current of which more responsible or virtuosic actions must swim. In this sense, an arbitrary hierarchy is reproduced as a set of relations across time as well as space.

---

[50] In this section, the concepts of mimicry and make-believe imply but do not develop a comparative study of cognate concepts in Lacanian psychoanalysis (*Wiederholungszwang*), Gurdjieffian practice, Benjamin's critical theory (among others) and Blake's political and aesthetic vision. Such a detailed analysis is beyond the scope of this paper but a fruitful point of departure for future work.

[51] This contrasts Wilber's (2000b) emphasis that increasing grade, depth, and complexity is a positive development, a symptom of spiritual growth for individuals and societies (p. 78).

[52] For Wilber, transformation is how a holon acquires more levels, which "produces greater depth, and less span" than before (p. 68). I call such a process development in Anderson (2008). Transformation as I explicate it in Blake should be contrasted against Wilber's view of transformation, rather than compared to it.

[53] According to Wilkie & Johnson (1978), *The Four Zoas* is "one of the most encyclopedic works of the last three centuries, a deeply considered critique of public values" (vii).

[54] While critics such as Bakhtin (1981) assume that individual epics aspire to a kind of unity, according to Quint (1993) the genre of the modern epic inclusive of *The Four Zoas* is discontinuous. This discontinuity proves to complicate Blake's project, because the genre of the dissenting modern epic has nearly as long a history as the Virgilian epic does. Quint traces the history of two epic traditions apparently but not actually in dialogue with one another in the west: that of the "winners," identifying their own interests with that of imperial power (The *Aeneid* and its successors), and that of the "losers," which functions

Characters throughout *The Four Zoas* lament a lost golden world, an absolute past of pleasure and peace. According to Ahania, "liberty was justice & eternal science was mercy" (39.11) in this prelapsarian time. *Paradise Lost* is primarily concerned with this beginning of history as a theological matter, promising from the start a moment when "one greater Man/Restore us, and regain the blissful seat" (1.4-5) but never showing precisely how this promise can be fulfilled. That paradise is also lost for most of *The Four Zoas* is obvious in that something has intervened in the lifeworld of the poem's characters, dividing them from each other and the fruits of their labors and intentions; much more unique (also in contrast to *Paradise Lost*) is Blake's narration of the End of History, which brings about a return to this state of affairs by special means (see sections *One Way to Stop Pretending and Start Transforming the Whole (Damned) Thing* and *Kindness and/as Revolutionary Praxis*). If *Paradise Lost* promises to assert Providence through the grand narrative of Christendom, *The Four Zoas* is intended to provide an even more complete version of that teleology, including the intervention of a pathological social order and a redemptive end to its naturalized, repetitive patterns of use and abuse that characterize everyday life under that regime—in short, to show how Providence is asserted politically (a first intervention). This end leads to an instance of improbable logic: *Blake's epic is still more absolute in its repudiation of absolutism than Milton's presumptively encyclopedic epic* because it seems that much more complete, even as Blake disregards the singular metaphysics of God as exclusive character or monotonous voice. Paradoxically, in terms of determination and causality, *the text not needing to posit a personal God becomes more inclusive of the subaltern, of time,*

---

satirically in relationship to both the politics and the structure of the Virgilian epic (The *Pharsalia* of Lucan, for example). Virgil founded the literary and political conventions of the written epic. According to Quint, "The *Aeneid* had, in fact, decisively transformed epic for posterity into both a genre that was committed to imitating and attempting to 'overgo' its earlier versions and a genre that was overtly political: Virgil's epic is tied to a specific national history, to the idea of world domination, to a monarchial system" (p. 8). By contrast, "paths of resistance to epic triumphalism assume a common shape: in opposition to a linear teleology that disguises power as reason and universalizes imperial conquest as the imposition of unity upon the flow of history, the dissenting narrative becomes deliberately disconnected and aimless" (Quint, 1993, pp. 40-41), as if to show that history is not going anywhere in particular, regardless of what the empowered say in authorizing their own position.

and of possibilities for real transformation than the metaphysical one claiming to justify His existence and to describe the practical application of His Being.[55]

Paradise Lost presents an exotic, mythopoetic world in its concern with space and time beyond mundane comprehension; presumably, none of Milton's readers can *really* know the actual breakfast conversation of Adam and Eve. Similarly, *The Four Zoas*' opening introduces the reader into a necessarily exotic world relative to mundane human existence: "Four Mighty Ones are in every Man […] The Universal Man" (3.4-6). This verse, heavily glossed with references to the Gospel of John, insists that the figures of the following action, the titular four Zoas—Urizen, Tharmas, Urthona, and Luvah—are actually present in the reader (assuming in the process that all readers are literally men, and that all readers will identify themselves with its model of the subject, the Universal Man), and in fact present an accurate map of the reader's person and potential. Traditionally, this poetic and rhetorical technique is called *psychomachia;* it is not without significant precedent in English print culture (Anderson, 2003).

One means Blake employs to encourage his audience to identify with the psychomachia is to tie it to national identity, a strategy used for explicitly nationalistic, even paranoid, ends by Phineas Fletcher in *The Purple Island* (Anderson, 2003). The Purple Island topos works on the principle that what is true psychologically and physiologically for an individual consciousness stands without fail for religious and cosmological truth, and also holds for the body (and mind) politic. This is holistic in its nature. Blake adopts a similar allegoric logic in *The Four Zoas*. The Universal Man, Albion the Giant, is identified without equivocation as England early in the poem (an expedient nationalism crushed in the poem's revolutionary finale), as evidenced by the names of his circulatory organs: "Groans ran along Tyburns brook and along the River of Oxford" (25.7). And as in *The Purple Island*, the peak of the political structure of the poem's subjective space is found in the brain, "Where Urizen & all his Hosts hang their immortal lamps" (11.17). The world of the poem is further made exotic by the behavior of the landscape, which does not abide by conventional physics. It is sympathetic rather than static, changing in one instance from a space resplendent with flowers and "rivers of delight" as Los and Enitharmon pass through happily, into a series of "dismal vales" and "iron mountains" as they return racked with guilt (61-62). The irony of Blake moving Milton's exotic into psychomachic space lies in the same assumption that all readers will recognize the elements of the action within themselves and their culture, allegorically;[56] that which is most foreign to experience—a time before the beginning of time—becomes an aspect of that which is most near, the stuff of one's body, being, and becoming, an intimation of nonduality (Anderson, 2008).

---

[55] *The Four Zoas* relies on a different theory of determination from Paradise Lost and from Wilber and Litfin. The agent of transformation is not Spirit or God—it is a human recognition of error and a contrary resolve toward compassion-in-action among active subjects (a basic virtuosity). I do not claim Blake excludes his dissenting Protestant God from the poem or from politics; I do claim that the role of said Godhead in political theory differs from an idealistic position in this respect. The total vision of *The Four Zoas* is theological to the core if idiosyncratically so.

[56] Buck-Morss (1991), working from premises in Walter Benjamin's critical theory, examines this kind of allegoric thinking as a form of critical practice analogous to waking from a dream (with some relevance to the practice of lucid dreaming): one must recognize the dream as a dream before waking from it (or in it) and acting on it (or in it) meaningfully.

Mechanics of Make-Believe

Instead of asserting absolute authority, the Miltonic mandate to justify the ways of God to anyone, Blake relentlessly represents the mimetic consequences of that gesture of discursive and ideological power, describing an impenetrable, preposterous, turtles-in-all-directions field of subordination and domination, a great bureaucratic chain of *bindings*. This is the first state from which the poem's transformative model begins, the problematic of the present. The problem is not a mythopoetic fall of man, but a perverse and divisive social experiment.

Initiating the action of the poem, Urizen the usurper establishes a certain pattern of behavior that is congenial to his own idea of empire, and the rest imitate him (or enact a Great Refusal of doing so) in ways suggesting both assent and dissent at once. The characters of the poem mimic Urizen's self-fashioning because they are constituted to do so as Urizen's subjects. His power and his means reproduce as others imitate his power and means. But no imitation is perfect; each instance represents a duplication with a difference, and that difference, when observed, makes the act of mimicry explicit (Bhabha, 1994). This bears an important relationship with Blake's preoccupation with demonstration and doubt, and Blake's parody of Urizenic denial of material conditions and affirmation of self-serving Cosmic-scale make-believe.[57] The figure of Urizen, the specific form of his self-fashioning, embodies many forms of absolutism recognizable to an eighteenth-century audience—that of the monarch, the rationalist, and the epic poet—all conflated in the figure of the seemingly divine sage of the sun, as if each assertion of power represents a legitimately unlimited imperial stake. Blake is invoking a convention of epic established by Torquato Tasso, where "rationality" becomes "embodied by the teleological epic plot" (Quint, 1993, p. 38). The epic hero and the epic poem are made representatives of normative rationality; Urizen embodies this. Imitating Urizen, the others produce occasionally dissenting behaviors that show how Urizen's are constituted by contrast with them.

Urizen behaves as one would expect a colonial power to behave, by now-familiar mimetic means, disrupted by transformational surprise.[58] According to Bhabha (1994), "[t]he success of colonial appropriation depends on a proliferation of inappropriate objects that ensure its strategic failure"—a slave mimicking a master must remain a slave, the fact of which disrupts said mimicry—"so that mimicry is at once resemblance and menace" (p. 86). The menace is the threat to order, to the coherence of regime, presented with the assumption that any subordinate element could become the master *fully* and without qualification or accountability (see section *Retelling the Epic of the Superholon*). As such, "[m]imicry *repeats* rather than *re-presents*" (Bhabha, 1994, p. 88). And a knowing, parodic take on this repetition informs Blake's rhetorical, poetic, and thematic strategies.[59] Irony induces a practical skepticism, minimal doubt; this doubt discredits the *mechanical* kind of belief needed to maintain the absoluteness of the absolute, making space for virtuosic action. Blake pursues this line of thinking to its logical end, long before Richard Rorty began to propose the basis of a postmetaphysical culture in precisely this kind of humane irony (Anderson, 2008).

---

[57] Blake's merciless parody of the political, authorial, and implicitly commercial uses of claiming to be God (or of God, or uniquely knowing God) does not foreclose the possibility that someone may in fact have been God, or be God, or become God—a possibility Blake's theology in fact depends on. It also depends in every case on the assumption that for such a performance, there will be a ready set of followers.

[58] In a related context, Ziporyn (2003) offers a suggestive recontextualization of alterity: Revolutionary desire is "the only true revolutionary ethics," in that it is "the desire for the *wholly other*. This is the desire for *everything without exception*, including oneself, including the rules, including the parameters making the field of experience possible, to be *otherwise*" (Ziporyn, 2003, p. 410). This is the precise counterpoint to mimicry. As will be seen, Enitharmon's diabolical abandonment of all known values in a moment of impiety, behaving with kindness and in a sense creativity rather than mimicry, is such a moment. It is a miracle. Every being is participating in this; for Ziporyn (2003), it is up to each holon to accomplish this, or to be led through "potentially disastrous" consequences in the form of a pathological regime (p. 416). In language that echoes Deleuze-Guattarian desiring-production: "every moment of experience is inescapably a revolution, setting up a new standard of value" (Ziporyn, 2003, p. 417).

As a Sun King, Urizen's self-promoting rhetoric conflates political and supernatural power: "I will walk forth thro those wide fields of endless Eternity/A God & not a Man a Conqueror in triumphant glory/And all the Sons of Everlasting shall bow down at my feet" (95.22-24). His bad-faith claim to be God authorizes the absolutism of his politics and by implicit fiat his role in that political structure, which manifests in the form of a maritime empire, under which "slaves in myriads in ship loads burden the hoarse sounding deep/Rattling with chains the Universal Empire groans" (95.29-30). This empire, in its literal universality, subsumes everything, and by this logic it can presumably reach any corner of any space and claim that space for itself because all of everything is always already part of itself. Blake's knowing use of Virgilian epic conventions establishes Urizen's character very efficiently. Urizen's epithet, typically, is Prince of Light; that Blake bestows upon him a ridiculous number of additional epithets is telling of his skeptical and mocking attitude toward Urizen's hyperbolic epicness and philosopher-sage acumen and Importance—of the pomposity of his claim to be God, king, and knower of everything at once. One such is "the great Work master" (24.5), which corresponds to Urizen's behavior insofar as he masters the work of others while others do not affect his; he orders a bower built "for heavens darling in the grizly deep" (24.7), invoking Satan's role as project manager of Pandemonium's construction in Book One of *Paradise Lost*, where presumed or performed imperial power is mimetic of God's putatively real power in heaven. After landing at the burning lake, Satan rises up giving commands, and those around him follow as if the performance had been scripted; banners rise from nothingness, trumpets sound, a war machine is prepared, and a cherub "forthwith from the glittering staff unfurled/Th' imperial ensign" (1.525-570). Beelzebub complains that God may "over hell extend/His empire, and with iron scepter rule/Us here, as with those in heav'n" (2.326-329); Milton explains that the "sword of Michael," having smitten them, induces in them "no less desire/To found this nether empire[…]/In emulation opposite to heav'n" (2.294-298). The experience of political defeat subjectifies[60] the defeated ones in such a way that they intensely desire to construct for themselves a political order both in opposition to and imitation of that which defeated them, a resentful recipe.[61]

---

[59] Blake exaggerates in Urizen the kind of hero Alexander Pope presents in his translation of the *Iliad*. Pope (1967) takes pains to represent Menelaus, the cuckolded King, as a dignified figure to be taken seriously; "his Character is compos'd of Qualities which give him no uneasy Superiority over others while he wants their Assistance, and mingled with such as make him amiable enough to obtain it" (p. 206). Pope does not elaborate or demonstrate Menelaus' goodness; to assert it is enough. Pope recognizes that interpreting a monarch's actions ironically, as he accuses Chapman of having done, as "a Character of Ridicule and Simplicity" (p. 206) is to introduce skepticism of an assumed absolute into a text predicated on the inviolability of such an assumption. Pope is not willing to doubt his assumption that kings inherently practice politics in good faith.

[60] Foucault (1983) discusses the kinds of processes by which Urizen and his imitators produce their roles in terms of subjectivity constructed by means of power imbalances. In his late essay "The Subject and

Blake directly invokes this pattern in the behavior of the Zoas toward each other, each one imitating Urizen's power through building projects and violence as they take turns being God and king. Urizen, the Prince of Light, is revealed to be a version of Milton's Satan rather than Milton's God, as he pretends to be (as Satan does). Curiously, Satan is himself a subaltern in that he is imitating (rather than being) God; Urizen, the parodied figure of the emperor, is a direct imitation of the most comprehensive loser the European imagination has produced, the endlessly resilient and resentful devil. Blake reminds the reader of this through juxtaposition of Urizen's shape-shifting body and geographic location and his ideas about himself. Even when in the form of a dragon-tailed Satanic beast in the abyss, Urizen ironically keeps his epithets intact in the face of their falsehood: "the King of Light outstretched in fury/Lashes his tail in the wild deep his Eyelids like the Sun" (106.41-42). The mind of Urizen is, indeed, its own place. With this elaborate set of allusions, Blake suggests that one means by which empire is authorized may only be a performance of conventional make-believe gestures, and a blatantly incompetent one.

Pointing out the potential unreality of a *Weltanschauung* assumed to be concrete is fundamentally an act of dissent by means of doubt, or skepticism. Urizen moves against the potential for dissent by effacing the power of skepticism. He assigns to the rhetoric of science certainty, and claims *this* science for himself; to this end "schools [are] Erected forming Instruments/To measure out the course of heaven" (28.20-21), which heavens are soon arbitrarily "squared by a line" (30.10), suggesting regimented bureaucracy and the inadequacy of phenomenal reality to reflect Urizen's performed splendor, and a pedagogy that bends science to doctrine and ideology, reducing knowledge to story and spectacle (Debord, 1995). Urizen wants nothing in his performance to disturb the suspension of disbelief, not even the existence of material reality, as if observing the world of phenomena and drawing conclusions from it could undermine his project of absolute dominion. Blake parodies here the methods of absolutism by drawing it to its logical conclusion, and shows the twisting of scientific means and vocabulary to

---

Power," power becomes a "form" but also as a "technique" as it conditions the individual and individual behavior:

> power applies itself to immediate everyday life which categorizes the individual, marks him by his own individuality, attaches him to his own identity, imposes a law of truth on him which he must recognize and which others have to recognize in him. It is a form of power which makes individuals subjects (p. 212).

Rhetoric and performance are used here as tools in the service of power, crafting cells in a body politic to behave in predictable ways useful to power. For Foucault, the identities thus manufactured are useful to the empowered as real-time dramaturgy, which conditions or subjugates members of its audience, who then reenact that drama, continuing the process of subjectification. Representing a story authorized as history is a re-representation of an earlier performance to an audience suspended of its disbelief. To be authoritative, it must be familiar, bearing (repeating, reifying) familiar features.

[61] Nietzsche, among the first to explicitly analyze resentment as a condition of modernity, frames it much as Blake does implicitly, as an internal conflict corresponding to a concrete social situation:

> Certain human beings have such a great need to exercise their force and lust to rule that, lacking other objects, or because they have always failed elsewhere, they finally have recourse to tyrannizing certain parts of their own nature, as it were sections or stages of themselves (Nietzsche, 1992, p. 151).

accomplish the rhetorical ends of power, repeatedly invoking paradoxes illustrative of skepticism's potential power over discourse. Blake asks, "Is not the wound of the sword Sweet & the broken bone delightful" (92.36). One must take it on faith alone that war wounds are pleasant, and contradict the personally verifiable experience of pain. Again, reason and the scientific method are excluded as legitimate means of knowing (see section *The Claim of Evolutionary Idealism*). The kind of faith that by necessity contradicts experience of everyday phenomena makes Urizen's absolutism and the violence that follows from it possible. In this sense, Blake's equation of rationalism, the epic genre, the tropes of the Important Canonical Writer, and religious hegemony is not only in response to Milton and the history of epic, but also contemporary religious expression.[62]

Urizen's turn as an epic poet invokes tangentially Milton's own biography—an old man pushed from a position of political power into an obscurity allowing him to write Very Important Books—but more importantly, the use to which absolute epic rhetoric can be put: maintaining empire and the status quo of the empowered class. Urizen is closely tied to the books he writes, as if the books signify his being, and his presence or brand-image guarantees the validity of the books. Urizen the travels with his books, constantly arranging them about himself like a pieces of a self-conscious costume (77.19, 78.13); he answers Orc's questioning of him with the command, "Read my books explore my constellations" (79.20) and, hilariously, claims to be God again straightaway (79.23). Urizen assumes an overdrawn image of the *vates*, an icon: "Hair white as snow coverd him in flaky locks terrific/Overspreading his limbs. in pride he wanderd weeping/Clothed in aged venerableness" (73.28-30). His arms and legs covered over with his terrific hair, Urizen the icon becomes so hyperbolically overdrawn as to be useless for work; he is reduced to a legacy, a piece of rhetoric for the eyes, a preposterous spectacle of a man presenting himself to be Very Spiritual (or at least more spiritual than the others) in order to promote himself politically. Further, this costume seems intended to give some credibility needed to the bizarre and implausible claims he makes about his own knowledge. Urizen narrates in his "books of iron & brass" his reminiscences of "The enormous wonders of the Abysses" (70.3-4). Like Milton himself, Urizen claims knowledge of that which is beyond ordinary apprehension, and his books—like patterns of belief—seem supernaturally sturdy across expanses of time and space. Urizen dies and awakes from death during his descent into a

---

[62] Rosso (1993) situates *The Four Zoas* in "a distinct tradition of Anglican apologetic poetry" that includes poems by Edward Young, William Cowper, James Thomson, and Alexander Pope (p. 48-49). When Blake's project of illustrating Young's *Night Thoughts* collapsed, "Blake salvaged the work by co-opting proofs from his *Night Thoughts* designs," and directly "inserted his own text into the blank space reserved for Young's poem" (p. 49). While he does seem to be sending up *Night Thoughts* specifically, Blake is more concerned with targeting the more robust epic tradition, as evidenced by his nearly obsessive parody and praise of Milton. Rosso puts this intertextuality in the context of eighteenth-century English religious history: "The liberal wing of the Anglican establishment consolidates its power between 1680 and 1720, when the concepts of mechanical science make their way into the common language of philosophers, preachers, literary journalists, and coffeehouse wits" and many poets (p. 51) working under the anxiety of Milton's influence. As with Urizen and his followers, only the vocabulary and not the method of science is embraced. Ironically, scientific language, predicated on doubt and experiment, becomes a means of erasing doubt. By Newtonic theology, "The Creation becomes a model for a stable polity, as God is manifest not only through the laws, order, and harmony of nature, but, by analogy, through the law of right reason within" (Rosso, 1993, p. 52). The sound of Urizen's name—voiced as "your reason"—suggests Blake's view of this development.

Miltonic hell repeatedly, and as his body rots and falls away, “the books remaind still unconsumd” (71.35-38); according to Blake, “such a journey none but iron pens/Can write And adamantine leaves receive” (71.41-42). Blake compares the creation of these seemingly static and eternal documents with the act of government—Urizen often seats himself “in a dark rift” in order to “regulate his books” (72.6)—implying that the persistence of political forms is tied not only to the adamantine pretensions of epic conventions and positivist, metaphysical expostulation, but more importantly to implicit belief in the discourse of self-serving political figures such as Urizen who use the pretense of timelessness embedded in such gestures to maintain and enlarge their field of power.

In making of himself this spectacle of the Great Man of Great Books, Urizen is *doing politics*. Specifically, Urizen’s self-fashioning presents the intersubsumption *not* of knowledge and power as in the familiar Foucaultian formulation, but of power (“I am God”) guaranteed by threats and acts of violence *integrated with a simulacrum of the production of knowledge* (“read my books”)—a belief system in scientific drag, passing as reason, and promoting itself as more than merely authoritative but also profound, timeless, important and canonical by means of this performance. From here, a characteristic feature of Wilberian practices of knowledge production and dissemination can be marked if not at present analyzed in comparison to Urizen’s. Wilber’s claims about his person and his spiritual status, as in Wilber (2000a)—the veracity of which I will not contest or defend—serve to supplement or guarantee the validity of his claims to knowledge about Spirit, which predicates his claims about all other things, as in Wilber (2000b). The latter claims then give sense, context, and meaning to the former.[63] Thus, Wilber’s oeuvre is in some ways predicated on the same deferred, circular logic of self-fashioning as Urizen’s.

Ironically, Urizen does not write until he is removed from power, as if his writing is intended to recover his position of actual dominance, but the patterns of his behavior continue as the other Zoas carry on their imitation of and of his self-fashioning. The content of Urizen’s books is strikingly explicit. Urizen reads from his book of brass on power and its means, explaining his use of discourse in maintaining his position of privilege. The excess of unintentional pathos in Urizen’s rhetoric further indicates his tendency toward hyperbole and exaggeration; his conscious use of contradiction seems strategic and Satanic (the mind making a heaven of hell) at once. Urizen’s matter-of-factness is revealing:

> Compell the poor to live upon a Crust of bread by soft mild arts
> Smile when they frown frown when they smile & when a man looks pale
> With labour & abstinence say he looks healthy & happy
> And when his children sicken let them die there are enough
> Born even too many & our Earth will be overrun
> Without these arts If you would make the poor live with temper
> With pomp give every crust of bread you give with gracious cunning
> Magnify small gifts reduce the man to want a gift & then give with pomp
> Say he smiles if you hear him sigh If pale say he is ruddy
> Preach temperance say he is overgorgd & drowns with his wit

---

[63] This circularity can be represented schematically as follows: Writer claims X is true; writer claims Y is true. X is premised in part on Y, Y is premised in part on X, and both depend on and reify a certain rhetorical position of the writer as a coherent, homogenous figure of authority.

In strong drink tho you know that bread & water are all
He can afford Flatter his wife pity his children till we can
Reduce all to our will as spaniels are taught with art (80.9-21)

Urizen continually repeats himself, as if he is trying to convince someone—even himself—of the rightness of his violence and oppression, even if denying and obfuscating material conditions through personally-meaningful storymaking is necessary (one imagines his books repetitively cover largely the same material). The strategy he describes here, of rejecting verifiable *Schein* for the sake of a doctrine, a performed *Sein*, seems directed at *creating subjects who only believe and do not doubt*, and who are willing to work for the sake of the one in the role of the absolute; in Wilber's patois, allowing the senior holon to organize their freedom on the promise of metaphysical development (see section *Retelling the Epic of the Superholon*). Urizen's repetitiveness foregrounds the offensiveness of his program. It shows Urizen does not unintentionally, incidentally, or accidentally mistreat those over whom he has power; nor is it a momentary lapse in judgment; he does so again and again. This suggests that repetition is a strategy for making Urizen's social policy normative, naturalized. Urizen constantly and repetitively discourses to a captive audience;[64] his voice is omnipresent from "the temple of the Sun his books of iron & brass/And silver & gold he consecrated reading incessantly/To myriads of perturbed spirits thro the universe" (102.23-25). *Not* listening to this same dull round, disengaging from it, is not possible insofar as it is not yet imaginable. However, that Urizen's captive audience is privately disturbed by his rhetoric implies that dissent is already present and, following this, that any seeming act of faith among Urizen's subjects is also a motivated or interested performance of conviction

Micropolitics of Mimicry

Blake also presents some of the consequences of these broader sociopolitical patterns in the everyday, domestic, and private lives of the Zoas—giving readers an alternative context to the epic sweep of nation that proves useful to the integral project.

Recalling the holographic logic of the Zoas (see section *Mechanics of Make-Believe*), one sees that the patterns of behavior Urizen and the others repeat over and over are both subjective and objective—a psychological and sociopolitical map. Blake exploits Urizen's monstrosity and performativity to illustrate the excesses of empire. Urizen establishes a pattern of violence as the other Zoas mimic his behavior; this process proves to be a means of subjectification and of revealing the limits of its own power. Benjamin (1986), developing a Weberian argument but also in some respects anticipating Agamben's (1998) claims regarding sovereign power and "divine violence," posits that legitimized states assume to themselves a monopoly on violence, which becomes the means of production and maintenance of law, of normalcy (p. 300). Following this and returning to Los, one can suggest that acts of violence performed by those opposed to the regime in power (bracketing the question of the "rightness" of oppositional violence) make explicit the rhetorical and performative nature of that assumption of monopoly;

---

[64] This recalls the pedagogy Wilber (2003a) presents, in which students at the IC attend the same repetitive lectures again and again until the "second tier" occurs to them, such that the crowd knows all the arguments and becomes angry or joyful as if by a script or mechanical reproduction. Their stupidity constitutes the laugh-track to the novel's vapid and inconsequential plot.

empire is not so absolute that it can prevent someone from harming another by his own volition, regardless of the norms generated by state violence. The Others, such as Blake's hero Urthona/Los, can inflict cruelty on *someone* to assert their equal ability to be cruel—or, to reintroduce the political allegory of the bureaucratic relationship between Milton's God and His creation, the ability to exercise arbitrary power, power for the sake of power, and play at being God. This is what it means to be the same but not quite the same (Bhabha, 1994).

Accordingly, in *The Four Zoas*, the initial exercise or claim of power is immediately followed by violence of a strikingly domestic and personal nature. After Luvah seizes Urizen's horses, leading to Urizen's claim of absolute political and religious power, Los (so often a heroic figure for Blake) reacts with unexpected violence against his partner and lover, Enitharmon: "Los smote her upon the Earth twas long ere she revivd" (11.3). This conjunction of pompous rhetoric and domestic violence is one way in which Blake illustrates both the unexpected and dangerous consequences of discursive and mimetic power (and later, how those consequences become a site of responsibility). When Urizen declares himself "God from Eternity to Eternity" (12.8), Los, the prophet against Urizen's empire, sits resentfully "plotting Revenge" (12.9), and produces immediate, conscious mimicry of Urizen's behavior: "If you are such Lo! I am also such" (12.19). Urizen's own violence against Ahania comes after she gives him her vision of Luvah's ascendance, in an attempt to alert him to this potential danger to his position: "his strong right hand came forth/To cast Ahania to the Earth he siezd her by the hair/And threw her from the steps of ice that froze around his throne" (43.2-4)—another arbitrary exercise of power, the mimetic precedent to Los's act of violence against Enitharmon. Admiring without a second thought Urizen's success in transforming Ahania into nonexistence, Tharmas imitates this act by giving his companion Enion the same treatment, even taking on in the process Urizen's characteristic "voice of Thunder" (45.27). Los claims in Urizenic double-speak that "Our God is Urizen the King […]/We have no other God but he" and that "Los remains God over all" (48.15-18) after bringing about Urizen's fall. The awkward and unsatisfying position of Los, the artisan become King-for-a-day, is that his revenge on Urizen is precisely his *becoming* Urizen, *from which Los begins to learn that this mimetic cycle of violence is counterproductive*.

This lesson is reinforced immediately: Tharmas responds to Los' rise with his own variation on a peculiar strategy; rather than harming Enion, "he rap'd bright Enitharmon" (49.4). The consequence of this disgusting act—Los' dissolution into the Spectre of Urthona, emblematic of his alienation from himself and Enitharmon—proves Los' identification with Enitharmon through his grief and despair, and his inability to be like Urizen, distinguishable from his female counterpart, as Tharmas is. Los, now proven *not* to be omnipotent God but only what he always was, a fallible man, cannot pretend to be Urizen for the sake of playing the Sun King role, but the opportunity to develop an alternative to the cycle of mimicry and violence around him, which remain intact, presents itself. According to Tharmas, "Los, thou art Urthona & Tharmas/Is God" (51.14-15). Los the prophet remains discontented regardless of the personality of the absolute, "Raging against Tharmas his God" (53.25) instead of Urizen. Los works for Tharmas now on Urizen's terms, by Urizen's means, and with the same tools, such as the "Ruind Furnaces," as Urizen, in the process himself of torturing Enitharmon publicly (53.8) as if again to prove his identity as Los by his separateness from Enitharmon. Luvah, born as Orc, gets his turn at playing a rhetorically legitimized Sun King godhead by means of a bizarre parody of Christ's birth: "The Enormous Demons woke & howld around the newborn king/Crying Luvah King of Love thou art the king of rage & death" (58.21-22). Los binds him to a rock to the accompaniment of Enitharmon's cries (60.28-30), jealous of Orc/Luvah's supernatural claim to power, based on a story (as Blake suggests) that seems as arbitrary as Urizen's patterned claim to be God and king. As it turns out, Luvah finally takes his turn at playing God under very different circumstances late in the poem (see section *Kindness and/as Revolutionary Praxis*), mitigating the implication that Christ's story might be just another story, which is potentially offensive to Blake's project.

These fallacious demonstrations and rhetorical disputes against demonstrable fact among the Zoas have a juvenile and arbitrary feel to them, up to the moment change begins to take hold. Upon gaining power Tharmas muses, "is this to be A God for rather would I be a Man/To Know sweet Science & to do with simple companions" (51.29-30). Despite his long involvement in mimicking Urizen, Tharmas candidly recognizes the misery of this roleplay as Los does, and longs for what proves to be a restoration of a lost golden age posited simply as that state prevailing in the absence of the present nationalistic, imperial, and capital-accumulative regime. Blake's representation of political struggle (in public and private contexts) as a kind of mimetic roleplay shows the arbitrary and therefore alterable nature of claims and means to power.

One Way to Stop Pretending and Start Transforming the Whole (Damned) Thing

Finding means for ending such patterns, beginning with undermining the ridiculous claims that help hold them in place through means of knowledge other than pathos and blind trust of present authority, becomes a means for transforming unjust relations by ending the politics of privatized will-to-power. But those in control of these means recognize this possibility and move to foreclose it. Urizen structures the world of his intended subjects through a curse: "they may worship terrors & obey the violent" (68.26). The ones to be obeyed, even worshipped, are defined by their violence. Specifically, Urizen circumscribes himself, his own role and consciousness of it, as he makes his subjects literally into themselves. This works also by means of patterning.

Just as Milton's Satan constructs hell as an imitation heaven, Urizen attempts to reconstruct the space of Albion's members and faculties—the Universal Empire, after all, is reducible to one man by holographic logic—into a new, less divine space:

> he began to dig form[ing] of gold silver & iron
> And brass vast instruments to measure out the immense & fix
> The whole into another world better suited to obey
> His will where none should dare oppose his will himself being King
> Of All & all futurity bound in his vast chain (73.16-20).

Urizen seeks to erase dissent by erasing all doubt, creating thereby mechanical, automatic, and perfect faith—a notion Milton's God disavows—in a perverse Great Chain of Being. In *Paradise Lost*, God prefers obedience freely given. He could have constructed Adam in such a fashion that his obedience was assured, if it pleased Him to do so; "I made him just and right," God explains, "Sufficient to have stood, though free to fall" (3.98-99). Unlike Milton's God, Urizen is not interested in obedience for its own sake; to him, faith and loyalty are useful to achieve an end rather than inherently good virtues. In this way Urizen's imitation of the command to piety parodies Urizen and his clamoring after power and performing in its costume, rather than the Miltonic Godhead, who is posited as power necessarily regardless of any relationships He may be involved in. In short, Urizen himself mimics the traditional Protestant God *imperfectly*, but this God is a silent referent in the world of the poem, given that Jehovah does not appear as a character in *The Four Zoas*. In the causal position God the Father occupies in *Paradise Lost*, *The Four Zoas* offers repeated instances of rhetoric, violence, and industry—social patterns as determinants. The reader is led to expect a break in the pattern not only because such patterns are explicitly mutable, but also because even Urizen seems to anticipate such a break.

But Urizen is not interested in anything breaking from patterns of his own (mimetic) making. The Work Master, he plans, organizes, and regulates building projects of great magnitude. The altar alone of Urizen's hall represents the "labour of ten thousand Slaves" and the lives of "One thousand Men of wondrous power" (30.39-40). Work, the power to make another work for oneself, the product built, and the subjectivity of the worker are all conflated with and against each other in mimicry. Los and Tharmas each take turns undertaking large-scale construction and manufacturing projects in imitation of Urizen's. Regardless of the personality in the role of the Sun King, the act of manufacturing manufactures the kind of consciousness that Urizen desires among his subjects:

> We behold with wonder Enitharmons Looms & Los's Forges
> And the Spindles of Tirzah & Rahab and the Mills of Satan & Beelzeboul
> In Golgonooza Los's anvils stand & his Furnaces rage
> Ten thousand demons labour at the forges Creating Continually
> The times & spaces of Mortal Life the Sun the Moon the Stars
> In periods of Pulsative furor beating into wedges & bars
> Then drawing into wires the terrific Passions and Affections
> Of Spectrous dead (113.1-8).

The experience of work under these conditions creates in the worker a sense of time and space, measuring the peristalsis and circulation of the body by the rhythms of the factory. This transformation of a consciousness into a machine by these means becomes a kind of death.[65]

---

[65] Blake anticipates here and elsewhere much of Benjamin's compelling argument in "Theses on the Philosophy of History." Benjamin (1969) observes that the "struggling, oppressed class is itself the depository of historical knowledge" (p. 260), rather than the oratory singular, Urizenic figures. Blake demonstrates this in juxtaposing the physical transformation of the Zoas working under and for Urizen with Urizen's rhetoric of denial and contradiction. Here, the workers experience time in a way Benjamin characterizes as "empty" and "homogenous." For Benjamin, what is called progress is but a series of catastrophes, empty of any ameliorative progression—going nowhere. Empty, homogenous time can be opened into its own ceasing, at any moment. This "conception of the present as the 'time of now' which is shot through with chips of Messianic time," or the force of redemption (pp. 262-63), is analogous to the everyday, prosaic apocalypse Los and Enitharmon bring about one day when they stop acting (and reacting) according to pattern, but instead establish a new one.

This is true also for the Zoas, starting from the poem's beginning, where Blake explores subjectification also in the domestic context, in terms that are echoed later in the factory scenes. Tharmas asks Enion, "Why wild thou Examine every little fibre of my soul/Spreading them out before the Sun like Stalks of flax to dry" (4.29-30). Urizen, the Sun King, is present in every interaction; Tharmas feels exposed to *Urizen's* sun-like sight by means of Enion's eyes. Tharmas' being is drawn out like the wedges and bars of the mill. Enion first dissects Tharmas, then weaves him together again: "in gnawing pain drawn out by her lovd fingers every nerve/She counted. every vein & lacteal threading them among/Her woof of terror" (5.16-18), domesticated subjectification. Enion reconstructs Tharmas' being by following the patterns of Urizen's architecture. In the jargon of Deleuze and Guattari (1987), Enion first deterritorializes then reterritorializes Tharmas from his former state into paranoia. Blake's narration of this act, including Tharmas' agonized cries, reveals Blake's disgust with this process and the regime behind it.

Blake's ironic approach to absolute assertions can be understood as a kind of scientific doubt. Moments of materialism in place of rhetoric become moments of real productivity. Just as absolute certainty in the rightness of empire makes abuses such as slavery a ready means of upholding empire and slavery as right, the claim of absolute power introduces uncertainty into the rhetorical field; its logic is self-defeating. Declaring sovereignty without end implies the existence of ends. This claim exists because it is *not* a self-apparent fact; if so, the endlessness of sovereignty would not be claimed. For Blake, this lack of evidence produces doubt among those affected by the claim. Skepticism becomes a condition of dissent, and tied with irony, a *means* of dissent. Once Urizen has claimed absolute imperial domain, irony becomes effective because uncertainty (the opposite of absolute certainty) arises. According to Luvah, speaking from within Urizen's work machine, "Urizen who was Faith & certainty is changd to Doubt" (27.15). Blake parodies Urizen's reduction of phenomena to the controlling vocabulary of geometry, producing three sets of worlds with illogical lists of characteristics: some worlds "triangular right angled course maintain. others obtuse/Acute Scalene, in simple paths. but others move/In intricate ways biquadrate. Trapeziums Rhombs Rhomboids/Paralellograms" (33.31-35). A triangular course leads nowhere but back upon itself, and an angle cannot be both acute and obtuse at once. This suggests a kind of arbitrariness in the means by which Urizen sets out to conquest the material world, and to control the contingencies of demonstration and testimony. Los and Enitharmon attempt to revive Orc (62-63) because of this uncertainty. Their failure to undo their actions and their ensuing resolve to productive and nonviolent action demonstrates the relationship Blake posits in epic and system-making between certainty and oppression in many forms, and develops the opposing relationship between uncertainty and responsibility or virtuosity. Doubt becomes an interpersonal virtue, a basis for relations of care for another.[66] Immediately following this moment of domestic sorrow is a scene of mistaken certainty—Urizen, still calling himself King, reminisces over lost moments in the past when he could behave like himself, a king (63-65), not recognizing or admitting that the reason why he cannot do so is that another has taken his role. In spite of his presumed supernatural means of knowing, Urizen the *vates* consistently proves to be mistaken. Urizen "thought himself the Sole author/Of all his wandering Experiments" (80.51-

---

[66] Explicating the precise nature of alterity in Blake's ethics in this poem (as distinct from the ethical and virtuosic aspects of his political understanding) is beyond the scope of this essay, but it can be pointed to in this post-revolutionary observation—"Man liveth not by Self alone but in his brothers face" (113.25)—in comparison to the nonviolence of alterity proposed in Butler (2004).

81.1). This is not so, as Orc points out that he had taken some of Urizen's "light," and that much stood outside Urizen's "bounds of Science in the Grey obscure" (80.39-42). As practical science depends on publicly verifiable and replicable results, it follows that it must be at odds with the cult of unitary and singular epic vision such as Urizen claims for himself.

While it is true that Urizen is not actually God, the period between the eternity of the past and that of the future is occupied with Urizenic patterns of domination and violence. While Urizen acts as though he were God between the eternities, he recognizes that his tenure is limited to that period of linear time. The daughters of Beulah write "the Eternal Promise" on everything they construct, "their tombs & pillars & on every Urn/These words If ye will believe your B[r]other shall rise again" (87.5-6). Here, as they work at building Urizenic structures, they efface them with an artifact of a different sort of faith from the kind Urizen relies upon. In this instance of effacement, Blake narrates active *disbelief* in the permanence of the status quo in order to invoke a transformation, and predicates productive practice on uncertainty rather than make-believe. As Hershock (2000) suggests, this virtuosity is an active, creative act, not an ascetic or transcendental one. It is a practice of becoming-responsible.

In *Paradise Lost*, Milton signals the coming of the fall with a recognition that he must "change/ Those notes to tragic" (9.5-6). Milton's poem ceases to be an epic at that moment. Blake reverses the fall into a Urizenic regime by introducing redemption into *The Four Zoas* in such a way that its epic features vanish. The Zoas stop playing at being God-men, making complete Blake's exclusion of the Miltonic Godhead as a political agent in this poem,[67] and of any legitimized sovereignty of any being over any other.

Kindness and/as Revolutionary Praxis

In contrast to Wilber's evolutionary holism, in *The Four Zoas*, responsibility for meaningful transformation is taken up by the subordinated for the sake of the totality (inclusive of those who have, in the past, behaved irresponsibly), not offered from the "lower" to the "higher" by grace or bureaucracy.

A *domestic* and local transformation, initiated by Los and Enitharmon, utterly ruptures the top-down, heirarchic Urizenic pattern of imitated violence. Los and Enitharmon recognize the errors of their past actions and identifications, resolve to behave responsibly, and withdraw their children from warfare; the family cooperates in building and decorating the city Golgonooza (97-98) for their own use and enjoyment.[68] This leads to a fantastic (and bizarre) inversion of the political and rhetorical order of the poem up to this moment. When Los refrains from harming

---

[67] This is consistent with Blake's theology as expressed in his fragments and *The Marriage of Heaven and Hell*, which is critical of Milton's representation of God as a Urizenic force: "All dieties reside in the human breast" (plate 11). It may be that the Zoas' struggles with one another is a kind of allegory of God pulling Himself together in one being, the archetypal Albion the Giant. Because Blake wishes to recuperate Milton as an ally, he argues that Milton unconsciously sought to undermine his own God by identifying with Satan, the opposer of God's works.

[68] This sequence of actions corresponds to the beginning of mainstream Christian practice: one repents one's mistakes, one carries forth with the resolve to sin no more. This is one way in which Blake's explicit religious views penetrate into his political program.

Enitharmon and clamoring against Urizen, Luvah, or Tharmas for the right to claim absolute dominion over everything and everyone, enacting a Great Refusal, peace and productivity arise, and he finds that *he must care for Urizen as one of his own children,* and *does*: "Startled was Los he found his Enemy Urizen now/In his hands. he wonderd that he felt love & not hate/His whole soul loved him he beheld him an infant" (98.64-66). *Los has become-responsible*. Even though this moment barely lasts a complete verse paragraph, it suggests that the means of peace are available to the parties involved in this dispute within Albion's body politic; the scene of domestic peace casts a deeply satiric light on the rest of the actions in the poem that have made such peace less possible for no reason comprehensible in the context of the poem's radically unfamiliar space. Smooth, destratified social space—radical democracy—proves to be more integrative, and experientially favorable to (and formally more transparent than) a baroque hierarchy of the type Urizen imposes from the stage of the philosopher-sage.

The turn-taking among the Zoas for the role of God is not yet complete, however;[69] the symmetry of the poem's structure, ironically, demands that the fourth Zoa, Luvah/Orc, finally play the part of the Sun King. The changed conditions demonstrate, however, that the end is near. When "fierce Orc in wrath & fury rises into the heavens/A King of wrath & fury" (111.15-16)—Urizenic repetition ironically invoked—the pattern of local violence is definitively disrupted, in that "Urthona gave his strength/Into the youthful prophet for the Love of Enitharmon" (111.31-32). Los/Urthona's effort and his motivation in this case is a sign of the transformation underway because, earlier, Los had prevented his son Orc's ascendance, jealous of the story surrounding him that authorized his turn at playing God. Luvah as Orc, however, continues to imitate Urizen against Urizen, even as his behavior is infinitely softer. Instead of conscripting armies of laborers and working them often to death as Urizen had, Luvah begins his role as architect by building a simple home for himself and Vala at her suggestion (127.29-30), also reflecting the domestic, democratic revolution of kindness Los and Enitharmon had begun.

Blake unambiguously defines this transformation and that of Urizen in apocalyptic terms. The last Night is entitled "Night the Ninth Being The Last Judgment." Blake asserts that his text is not only allusively and structurally apocalyptic but is literally of the same substance as the Biblical Apocalypse, declaring that "John saw these things Reveald in Heaven/On Patmos Isle" (115.4-5). Los decisively begins this event by seizing the "Sun" and demolishing "the heavens across from immense to immense" (117.8-9); the parallel to Urizen's claim of being God from eternity to eternity is explicit. As Wilkie and Johnson (1978) show, Los advances the transformation further by destroying Urizen's books (pp. 212-213). Symbolically Los' striking at the sun does not obliterate phenomenal reality—the world of forms—as much as the totality of social strata, including the role of the Sun King, the field in which he operates, and the mechanisms holding him in place; "slaves are set at liberty" while "the thrones of Kings are shaken they have lost their robes and crowns" (117.15-23). The props and costumes by which these monarchs iconify themselves evaporate, as if performance as such has fallen away. Significantly, Urizen loses his status as an iconic *vates,* at this moment. The Giant Albion, the figure analogous in scale to the Wilberian superholon, awakes, and not understanding what is happening within him, laments that moment when "shall the Man of future times become as in days of old" (120.5). He cries out for Urizen, first by his epithets—"great opposer of change" and "dread form of certainty"—but Urizen does not respond (120.14-25), at which point Albion himself behaves like the Urizen of old, vowing to "sieze" his "crown and scepter," to "regulate all my members" (120.35). Urizen's rejection of his own absolutism leads to an implicit transformation of the macrocosm, Albion. Urizen encourages Los to do what he has already done, to precipitate the apocalyptic transformation—"Rend down this fabric as a wall ruind & family extinct"—and renounces any regulation or control over anyone: "Urizen no longer curbs your rage" (121.25-26). Urizen ceases to play at being a Milton or a Leibnitz; his venerableness falls away with his hair and robes, "he shook his aged mantles off/Into the fires" (120.29-30), arising youthful. But the structural symmetry and kinetic (karmic) energy of the poem have not yet been exhausted, with the consequence that the end of history has not been completed. When Urizen becomes fully what Kierkegaard (1989) might call fully human after casting off his Milton costume, Ahania dies of excess joy (121.37), the opposite process of the earlier patterned violence, but giving the same end (and suggestive of a bawdy Shakespearean pun). This surprise, the transformation, is not a "symmetry break," which is taken to be a leap or momentary discontinuity in an otherwise continuous evolution (Wilber, 2000b, pp. 50-51), where evolution is understood as a teleological—even divinely-sanctioned—process. By contrast, the Blake of *The Four Zoas* is a *revolutionary*, not an evolutionary integral thinker; he proposes a transformational, not developmental, model for action against a totality of contingent social and political formations.

---

[69] In Buddhist terms, it is as if the Zoas have purified some of their past karma but not yet exhausted it, so that it manifests in a modified form rather than as a mechanical reproduction of it (Gampopa, 1981, pp. 74-90).

Urizen finally declares with joy that "Times are Ended" (131.31), and with time slavery and empire have also ended, indicating that the posited absolute past has returned; "their ancient golden age renewd" itself (126.29). A very strange moment arises in response to this, when "an African Black from the little Earth of Sotha" sings a song (echoing Blake's "Jerusalem") of his own composition, recognizing a lost Paradise before him:

> Aha Aha how came I here so soon in my sweet native land
> How came I here Methinks I am as I was in my youth
> When in my fathers house I sat & heard his chearing voice
> Methinks I see his flocks & herds & feel my limbs renewd
> And Lo my Brethren in their tents & their little ones around them (134.35-135.3)

How is it that the body of England can be a direct replication of an African village—specifically, a village in an Albion-like place (or being, since this is still psychomachia, still holographic in representation) that is suddenly and happily identified with part of Africa by an African native as his own? Conventionally, an element of the microcosm Sotha is understood as foreign to Albion's green and pleasant land, but that he feels at home in it suggests a hospitable dissolution of the divisions and exploitations of empire, nationalism, and slavery, as if beyond the psychomachia conventional subjectivity falls away and minds literally run into one another, also implying absolute democracy and authentic communion of the African singer's experience with that of Albion's Zoas. Everywhere is home, anywhere is here—this presents a decentered logic approaching nonduality. Blake's singer experiences with them the same change in being. After being ignored and remaining silent for the entirety of the poem's action (Spivak, 1988), after this apocalyptic transformation, the subaltern *sings*.

The poem closes with this claim: “The war of swords departed now/The dark religions are departed & sweet Science reigns” (139.9-10). Direct apprehension of phenomena is used as a means of showing what emblems and ideas had been bent to do—“The tender maggot emblem of Immortality” (136.32)—to misrepresent reality while claiming to do the opposite, in short, to obfuscate and lie. Skepticism, science, reason, and irony properly applied rectify the real limitations, make-believe, and ideological work of idealism as epic or as Final Philosophy. After the revolution that is, literally, an act of love, violence and limits between minds have fallen away, suggesting that all vestiges of subjectification and mimetic performance have evaporated. The ending of *The Four Zoas* is actually an annihilation of empire, the total destruction (not reform) of the pathological regime. In contrast to the image of reterritorialized, domesticated Bibles of 19th century English missionaries in India (Bhabha,1994, p. 92), after the revolution no trace of Urizen’s missionary activity or his repetitive literary output can be seen.

Albion the Giant has become a radical democratic Utopia, a Body without Organs. Blake concludes that once a certain kind of doubt is introduced, an ideal community can arise. Observations of it are possible, but no story can be told in or from this community, because time imagined as progress does not exist. By contrast, where Wilber promotes evolution of consciousness, Blake prescribes a radical intervention, working virtuosically with the discourses available to him—the mythmaking of vernacular Protestantism and epic poetry—by means of skepticism toward the claims and the knowledge-production of these discourses.

Politics in Good Faith

Blake presents a responsible transformational model in *The Four Zoas*. Becoming-responsible for present purposes has four characteristics: critical clarity, competence, consciousness, and compassion (Anderson, 2008). Blake considers each one in the course of *The Four Zoas*, by reversal: first rejecting a prevailing ideology and then proposing in its place a more productive strategy.

Critical clarity. Blake establishes a pathological pattern of subordination and abuse predicated on (and expressed as) aesthetic normativity and good-sense metaphysical doctrine, pushed to its sociopolitical conclusion: playing at being God through make-believe and violence, epistemic and physical. Then, Blake encourages a critical response of doubt, scientific skepticism, and Socratic irony (a postmetaphysical response), typified by Tharmas’s observation that playing make-believe is inherently unsatisfying. This intervention leads to a second one, that which transforms the totality.[70]

Competence. Urizen’s performance of capability (“read my books!”) in a costume that renders him incapable of doing practical work is contrasted against the domestic labors and artisanic craft of Urthona (Los and Enitharmon), who proves to be capable of making useful and beautiful things—and taking responsibility for the impersonal welfare of beings as if they are his own children (competence in critical action and competence in compassion).

---

[70] I explicate this doubled structure of first and second interventions in Anderson (2008).

Consciousness. Mimetic, mechanical, unconscious stupidity expressed as thinly costumed will-to-power (as in Urizen's books) is counterposed by situationally aware, intelligent, and capable action (Urthona), as suggested by the capacity for taking competent action and quantifiable through Urthona's in-the-moment creativity.

Compassion. Blake recontextualizes the brutal selfishness of Urizen and Los's moments of violence against Enitharmon and others with Enitharmon's impersonal, egalitarian kindness as well as Los's taking responsibility for a vulnerable and childlike Urizen, by no means a configuration of his own will-to-power.

An Experiment in Radical Democracy

> [A]ll our sympathy lies with the wanderers, the gypsies, and heretics, rather than with the totalitarian murderers who try to fix them in place, number them, control them, and finally exterminate them. We wander because no nation, no ideology, no culture, no religion, no philosophy holds our loyalty or pins us down in time and place. We are cut loose. We drift. (Wilson, 1993, p. 156)

Introduction

I have proposed that Marxist and post-Marxist theory may offer a useful methodology for integral praxis in some respects (Anderson, 2008). One acknowledged problem with this position: Marxist revolutions have, by and large, turned out badly by degrees. Popular Unity, under Salvador Allende,[71] attempted to overcome this problem, broadly speaking as Buddhist social theorist Ken Jones (1989) diagnoses it:

> Where it has fully established itself, revolutionary socialism's intellectual elites have only been able to consolidate their power through an oppressive collectivism. These inert bureaucratic societies have no resemblance to what Marx envisaged, with their massive hierarchies of power, their harsh restriction on political and religious liberty, their

---

[71] Uribe (1975) offers an incomparable and candid first-hand narrative of the events from the perspective of a well-placed and well-informed Chilean diplomat, neither a socialist nor a conservative but a member of the Christian left; the so-called "Church Report" (1975) gives an equally valuable account from the perspective of the CIA. Henfrey and Sorj (1977) present the street-view perspective of everyday Chileans during this period; Castro (1972) shows what kinds of specifically Marxist inquiry were developing among workers and students in Chile; Morris (1973) gives a historical and topical overview of the moment informed by the author's experiences in Chile under Popular Unity; Cooper (2002) and Dorfman, Aguilera, and Fredes (2006) give a retrospective view from the bottom strata of the socius looking up, during and immediately after the Popular Unity period. Debray (1972) includes a series of interviews with Allende early in his presidency, affording some insight into his agenda; Cockraft (2000) anthologizes many of Allende's speeches, addresses, and letters on various occasions and subjects. Sigmund (1993) and Haslam (2005) both offer mature, sober, and critical histories of the period and its aftermath, the former emphasizing internal Chilean politics and the latter more concerned with U.S. intervention. Moss (1974) in my view gives an irredeemably flawed reading of the historical evidence, but one that counterposes the others cited here.

> persecution of dissidents, their insistence on ideological conformity, and the persistence of patriarchal patterns of life. (Jones, 1989, pp. 120)

Allende attempted to address each of these rather self-evident problems by instituting a Marxist revolution *democratically*, through the civil state, *predicating* this transformation on the enfranchisement and becoming-responsible of the socius rather than in opposition to the needs and interests of it. As Grandin (2007) summarizes this project,

> Allende's Popular Unity government rejected both Soviet-style suppression of civil liberties and American economic dominance, believing it could steer Chile down a peaceful road to socialism while maintaining political freedoms. Chile's challenge, therefore, was not that it would be turned into another Castro-style dictatorship but that it wouldn't. (Grandin, 2007, p. 60),

and the Nixon administration worried that this radical democratic model might spread first to western Europe, particularly Italy (Grandin, 2007, p. 60), where Autonomist Marxist praxis was developing along recognizably similar lines[72] (Wright, 2002; Katsiaficas, 2006). This shows Wilber's claim that the superholon evolves *toward* a regime latent within itself is valid in politics only so long as the "higher" holon is willing to enforce, by force, the imperative of that regime, to "organize the freedom" of its subordinate holons according to its own program. It also suggests that a bottom-up politics of becoming-responsible may be possible along lines suggested by Urthona's project, rather than Urizen's. Worded differently: To imagine putting a popular critical culture, mass virtuosity[73] as distinct from post-Leninist vanguardism (*pace* Jones' [1989] engaged Buddhist critique of Marxist institutional history) in charge of the totality is to imagine an integral society in place of the stratified, conflictual one that obtains under neoliberalism.[74]

---

[72] Uribe (1975) confirms this: "The United States needs very much to prove that the Chilean model, in which a state attempts through democratic means to stand on its own outside the imperialist system, is not possible" (p. xi). The coup was as much about ideology and hegemony ("spreading democracy" in the interventionary patois of now-disgraced but still vocal American neoconservatism) as natural resources and labor.

[73] Here, critical culture should be understood as a historically contingent set of means for mitigating *stupidity*, where stupidity is understood much as Lukacs (1967) understands reification, as unwittingly acting against one's objective self interest by *necessary* involvement with a situation or structure one has no final control over, and where one's real interests are defined as the immediate and ultimate benefit of every being with any investment in the situation at hand (Van Boxsel, 2003; Anderson 2008).

[74] The present inquiry considers how a subordinated totality, a state or society, can begin considering how to viably democratize, destratify, and intentionally integrate itself with itself. This differs from the problem of reterritorializing the global totality analogous to the "World Federation" Wilber (2003b) proposes in his comments on Iraq. Relations among states will, of course, be contingent on resource control and allocation, and the terms of that control. This problem is much more difficult to conjecture on because the only known global order—the only total superholon this planet has known in the political-economic sense—is imperial capital, in one iteration or another. Marx, for instance, has precious little to say about global communism as an alternative. That said, while this relation is beyond the scope of this work, it is of primary importance for further development.

In Wilber's diction, one might say that Chile in 1970 was integrated into a particular holarchy, subordinated to a superholon (global capital, enforced by the hegemony of American military power) that determined the scope and terms of its development, while that regime extracted useful natural resources from Chilean soil—copper ore, saltpeter, and human labor (see section *Retelling the Epic of the Superholon*). Capital had "organized the freedom" of this particular holon's members in a particular (and predictable) way. Chilean society was stratified along class lines, expressed in a separation of those in relative control (or in alliance with those actually in control) from those in relative poverty, but also expressed in viable mass-political movements. Allende proposed instead that Chileans from all classes should take responsibility for their working conditions, the products of their labor, the redistribution of their land, their natural resources and the terms of their extraction and development, and for general welfare measures (particularly in mass education and health care) to help ensure a socius competent to take on this responsibility.[75] This quite literally made the state both fragile and vulnerable—fragile in that Allende, concerned more with democratic rights than with the centralizing power behind his agenda, refused to subordinate and reorganize Chile's military forces, which arguably alienated the military and state bureaucracies from his leadership—and vulnerable due to the disorder inherent in any transition toward a comprehensive reorganization.[76] As it happened, everyday life circumstances, such as the price and availability of foodstuffs, fluctuated uncontrollably as the state sought to reintegrate a different regime for developing the terms of everyday life circumstances such as labor, health, and education (see section *The Endgame; Or, Limiting the Indeterminacy* for plausible causes of this disarray).

Specifically, Allende proposed to integrate the Chilean socius by democratizing Chilean institutions, beginning with a mitigation of the lack-of-control over one's life habits and labor that characterized Chilean working life: in Allende's words, "[o]ur aim is the attainment of social freedom through the exercise of political freedom, and this requires the establishment of economic equality as a basis" (as quoted in Debray, 1972, pp. 182-183), the social ownership of productive means, in traditional Marxist diction. Pursued a bit further, however, economic equality can also be expressed as work democracy, where all who labor toward the fulfillment of a given project have a hand in determining the course of the project and the conditions of executing it (Schweickart, 2002). As *The Four Zoas* suggests, full and impartial enfranchisement is a condition of compassionate politics. This is distinct from the undemocratic idealism of Wilber's model (see section *Retelling the Epic of the Superholon*).

---

[75] In this respect, the program that Allende led into power is analogous in its broad strokes and strategies to the Deleuze-Guattarian nomad project, insofar as Popular Unity swept a locus of power (the disenfranchised) into the legitimate State. As Wilson (1993) argues,

Deleuze and Guattari based their work *Nomadology* in part on Ibn Khaldun's thesis of nomadism as the nucleus of power (a 'war machine') against the State and by extension against any centralized or absolutized authority. They simply turn Ibn Khaldun on his head by arguing that the purpose of culture is not the glory of the State, as Ibn Khaldun says, but is rather to be found in the freedom and even the randomness of the nomad (as Ibn Khaldun at times seems to imply). Deleuze and Guattari, who may be called Nietzschean post-Marxist anarchists or 'dada epistemologists' (to quote Feyerabend), here find themselves in harmony with our Sufi historiographer (pp. 158-159).

[76] P. Anderson (1980) summarizes this: "[m]orality without strategy, a humane socialism equipped only with an ethic against a hostile world, is doomed to needless tragedy: a nobility without force leads to disaster, as the names of Dubcek and Allende remind us" (p. 206). The "embrace" from above is, here, a vulnerability to risk, a precariousness.

Further, Allende proposed democratizing (destratifying) culture and its production as it is conventionally understood ("story" in Litfin's terms) along these lines, by promoting an ambitious program of education for Chileans of all ages, classes, and geographic locales, so that all members of the social formation could have the tools, skills, and materials to do at least basic intellectual work, and by relocating cultural production from the global-hegemonic to the local-democratic.[77]

> A new culture cannot be decreed. It will spring from the struggle for fraternity as opposed to individualism, for the appreciation rather than disdain for human labor, for national values rather than cultural colonization, and from the struggle of the popular masses for access to art, literature, and the communications media and the end of their commercialization (Allende, as quoted in Cockcraft, 2000, p. 273).

Pax Cultura: this is a *critical* politics predicated on care for the well being of the totality and all its members, recalling Los and Enitharmon at their work, in contrast to the tiresome and self-imitating decrees of Urizen in his philosopher-sage costume demanding to be read and obeyed, but unwilling to teach, listen, or discuss.

Allende's strategy for reterritorializing a bourgeois regime into a fully responsible democratic one shows his program to be creative, in fact conscious. Allende's plan relied necessarily on a unified, organized, and totality-conscious polity to enact, as needed, constitutional reform. "If we put forward a bill and Congress rejects it," Allende claimed, "we invoke the plebiscite" (Debray, 1972, p. 83)—which he counted on winning, so long as his proposals were in the interests of the subaltern majority and that majority voted its interests and was not misled or deluded. This is authentically Marxist theoretically (Marcuse, 1964; Lukacs, 1967), but innovative in praxis. Majority is not consensus; some, it should be understood, stand to lose a position of material and social privilege (that of acting the role of the senior holon) as a result of lifting those below up into cultural literacy and economic parity, while the totality (and thus everyone involved in it) benefits from dissolving its constitutive conflict between those that have and those that do not, the inherent disequilibrium in arbitrarily uneven development. Following Blake, insofar as Allende's project is creative and totality-contextualized (competently working for the impersonal benefit of all), I consider it a *conscious* one.

That said, Allende and his party were arguably incompetent to the very difficult task they took responsibility for, or at least not adequately competent to it. Haslam (2005) interprets Allende's actions as a kind of pataphysics,[78] managing multiple contingencies in several parties on an *ad hoc* basis while not adequately accounting for real resistance from outside and above, rather than implementing in a disciplined and coordinated way one theoretical and practical program—very unlike the rigorously planned and executed coup that forced him to suicide before surrender (p. 233). According to Haslam, Allende was not an original or rigorous theorist,[79] "no administrator and no economist;" the Soviets found the Chilean administration to exhibit "manifest […] incompetence" (p. 230). Further, Allende maintained—at least publicly—that the rule of law would protect his project from intervention from outside or above, a position that ultimately proved profoundly naive. Responding to the question of whether or not the Nixon administration would direct an intervention into Chile, military or otherwise, Allende responded:

---

[77] This is, without a doubt, a risky social experiment, but insofar as it is an intentional one, those participating in it are at minimum no less prepared for its consequences than social experiments such as industrial capitalism that arose not from a plan or a dialectical process of consciousness and conditions but from causes and conditions internal to the European economy. As it happens, Chile had been home to a specifically integral experiment as well, Oscar Ichazo's community of practice at Arica; the productive lifelong inquiry of Claudio Naranjo has its roots there.

[78] See van Boxsell (2003, pp. 194-198) for a value-neutral examination of pataphysics as an intellectual practice.

> I believe they will not do anything of this nature; firstly, because as I say, we have acted within the laws of Chile, within the Constitution. It is for this reason […] that I have maintained that victory through the polling-booths was the way to pre-empt any such policy, because this way their hands are tied." (Allende, as quoted in Debray, 1972, p. 126)

In short, to transcribe his thinking into Wilber's diction, Allende publicly argued that the superholon is incapable of "violating the laws" of its subordinate holons (see section *Retelling the Epic of the Superholon*), which history proved false in this case—whether he knew better privately remains an open question.[80] For present purposes, this suggests that Allende's radical democratic project may be sound in the abstract, but lacking in implementation and resources—and that reflecting on Popular Unity's successes, failures, and contexts can yield some useful insights for future integral macropolitical projects as an act of cultural memory, of story-making in the form of history and virtuosity rather than make-believe (see section *Praxis According to Evolutionary Idealism*).

The Endgame; Or, Limiting the Indeterminacy

This anticipates a significant observation about Wilberian evolutionary idealism when applied to politics: the end of Popular Unity by the irresponsible intervention of the superholon on the justification of an inherent telos that might be God proves Wilber's model problematic, having more in common with Urizenic will-to-power than with responsible development or transformation in the context of macropolitics, matters of public concern.

In response to Allende's election (and upon the failure of an attempted coup to prevent him taking office), the American president Richard M. Nixon

---

[79] In fairness, however, it should be recognized that Allende knew what to do with extant theory; he had what I call a *method* (Anderson, 2008). Specifically, Allende was interested in using theory in a dialectical relation to practice, claiming that "basic works like *State and Revolution* contain key ideas, but they can't be used as a Catechism" (Debray, 1972, p. 64); he was aware of Marxist theories of the imperialism of foreign capital such as Luxemburg (2000) (Debray, 1972, pp. 69-70), and as I have suggested, was capable of authentic innovation on the level of praxis and persistence over his long public life.

[80] In this context, the relationship between law and power in Wilber's holonography can be understood in terms Agamben (1998) develops for the state, law, and subject: law is produced through sovereign action, which is itself not bound by the law it enunciates; consequent to this capriciousness, there exist states of exception in which the law is defined such that it does not apply, and those placed under a state of exception have no legal or political identity apart from the enunciation of the sovereign: a position of absolute vulnerability not as a subject but as "bare life."

> instructed the CIA to 'make the [Chilean] economy scream,' and over the next three years, Washington spent millions of dollars to destabilize Chile and prod its military to act. It finally did on September 11, 1973, in a coup that brought Augusto Pinochet's seventeen-year-long regime to power. (Grandin, 2007, p. 59),

just as the U.S.S.R. had brutally put down a nascent radical-democratic regime in Hungary in the fall of 1956 (Brown, 1988). I characterize this as an expression of will-to-power on the part of the superholon, seeking to "organize the freedom" of a wayward, "lower," or "junior" holon on which it depended for resources—will-to-power because the superholon had benefited from the legitimately exploitative relation that had prevailed before Allende resumed power and was put at risk by his remaining in power, not because of a competent intention to be of benefit to the totality on the part of Richard Nixon (not only Nixon personally or primarily as a synechdoche for global capital). Interestingly, according to Haslam (2005), Nixon was motivated to act in Chile in part to avoid appearing weak internationally as his own incompetence and corruption in the chain of events conventionally referred to as Watergate was becoming exposed (p. 255). The coup that ended the Allende experiment and began nearly twenty years of state-sponsored terrorism in the South American cone was in part a vanity project of a resentful neurotic, but more broadly a gesture designed to reintegrate Chilean resource management into supply chains favorable to the accumulative or developmental regimes of international corporations. This is how "indeterminacy" is "limited."

Here, Chilean history parts ways with Blake's model as well, because the Cosmos did not sympathize with Popular Unity as it did in the Universal Man with Urthona. Allende's actions did not invoke a Romantic apocalypse of spiritual renewal that allowed the subaltern to sing and reinstituted a global Golden Age of "sweet science" that was sustainable in its time. Popular Unity represents an attempt to establish a regime of new values in the face of very strong resistance from outside and above,[81] of responsibly made values; that the attempt failed is but more evidence on the nature of the transformative project and the risks of a fully engaged life:

> Life is very strange. To live: to go forward into a new country, set foot blindly on unknown ground and keep on drawing back the curtain of time. We know that somewhere is the precipice over which we shall fall. When? Will the next step be our last? We can neither stop nor draw back. (Thomasson, 1980, p. 190)

Politics in Good Faith (Reprise)

Was Allende's transformative project critical? Yes.

Was it compassionate? In that it was predicated on ameliorating the sufferings of others, yes.

---

[81] Allende's advice to Chile on the day of the coup, seeing the coup coming, suggests this persistence and commitment in spite of personal difficulty and risk: "You must defend the right to construct, through your own effort, a dignified and better life" (as quoted in Cockcraft, 2000, p. 7). As it happened, Allende chose to construct for himself a dignified and pedagogic death (a "moral lesson" p. 10): a self-inflicted gunshot wound, from a carbine given as a gift by Fidel Castro on his state visit.

Was it competent or virtuosic? Arguably not as competent as it would have needed to be, given the pushes and pulls and other strains it had to resist.

Was it conscious? Insofar as creativity in response to a challenge is a measure of consciousness, then yes, revealing a remarkable departure from the clearly hopeless Stalinist model for socialist practice (bureaucratic capital), to legislate an intentional revolution. It certainly would have benefited from greater situational (class) awareness.

Returning to the problem Plato poses in *The Republic*, on justice and responsibility, one can argue that the intervention of global capital into the Chilean state on 11 September 1973 was an unjust act, as it ended an attempt to redress an injustice through instituting a hopelessly unjust regime, the Pinochet dictatorship. This is politics in bad faith (see section *Introduction - Definitions*). But insofar as it served to disengage the Chilean subholon from the superholon of global capital, Allende's project can be seen as a counterintegral embrace and envelopment, to a follower of Wilber; further, the coup that restored that order by a "higher" power can also be seen as an integral gesture expressing increased depth and complexity, an evolutionary step forward (again to a follower of Wilber) (see section *Holarchy and Macropolitical Praxis*).

Conclusion—Neither Stopping nor Drawing Back

Where Litfin and Wilber present ontological and metaphysical models, representing reality and the transformations they allow that reality, *The Four Zoas* poses a transformational model for action through an imaginative space. Where Wilber (2000b) posits, "*[t]he greater the depth of the holon, the greater its degree of consciousness*" (p. 65), *The Four Zoas* inverts this; increasing depth, or stratification, is *decreasing* consciousness in the sense of increased reductivity, mimicry, determinism, and potential for irresponsibility in the expression of power, which is implicit in Wilber's assertion that "the new and senior pattern or wholeness can to some degree *limit the indeterminacy* (organize the freedom) of its junior holons" (p. 60). Blake's apocalyptic transformation also contrasts against Wilber's position that social and personal transformations function in a top-down manner (co-evolution); in *The Four Zoas*, we see a subordinated holon (Enitharmon) transform the macroholon (Albion the Giant), bottom-up. The case of the Popular Unity period in Chile (1970-1973) shows how the dynamic is expressed under late capital—where subordinating regimes assume a kind of responsibility for those below, even if the terms of that responsibility are by any definition responsible—and how Wilber's holonography simply flickers in theological development this self-same dynamic of politics in bad faith.

I argue instead for the persistent and intentional labor of instituting a just order through the transformative practice of becoming-responsible.

The Politics of Terrorism: Power, Legitimacy, and Violence

Richard A. Couto[1]

Abstract: This paper examines and juxtaposes discourses about terrorism, violence, and political leadership. It presents generalizations about terrorism—a form of political violence by, for, and against the state—and politics and violence based on the theories of Max Weber and Hannah Arendt. The stark contrasts drawn from these theories include power as non-violent strength (Arendt) versus power as violence-dependent (Weber) and the struggle for legitimacy between different agents (states and individuals) as well as terrorism by, for, and against the state. This reframing of power leads to judging a *lack of* power where there is violence, and the *presence* of power where one observes non-violence. An examination of political and criminal violence leads to questions about deliberate and purposeful violence, indirect and structural violence that has political consequences, and their relationship to terrorism.

It expands the application of terrorism to include indirect structural violence by indicating its relationship to direct violence, not only in traditionally-viewed terrorist action but in the ignored terror of, for example, inner cities. Terrorism has many forms by many actors. To synthesize the results of these lines of reasoning leads to a conclusion with considerable implications for politics and for political leadership. The politics of terrorism suggest a central counter-terrorist approach: de-politicizing the violence of terrorists whenever possible and using the authority and power of the state to institutionalize it as criminal violence. This, in turn, also means politicizing other forms of violence, such as capital punishment, and their indirect and structural forms, such as the inner city.

Keywords: Arendt, criminalize, political leadership, political terrorism, political violence, politics, state violence, structural violence, terrorism, war on terror, Weber.

Introduction

This paper develops the thesis that through an understanding of power as authentic leadership by legitimate authority, and violence as a sign of a breakdown of power, leadership, and legitimacy, we may begin to create more integral political narratives. When such narratives inform political leadership, authentic leadership is more likely to formulate other choices to

---

[1] Richard Couto (Ph.D., University of Kentucky) is a senior scholar at the Union Institute and University Interdisciplinary PhD program. *Political and Civic Leadership*, a forthcoming 2 volume SAGE reference handbook, is the most ambitious of his thirteen authored or edited books, four of which have won national awards. Many of the themes of this article get further consideration in chapters of that collection. He grew up in Lawrence, Massachusetts and received a B.A. from Marist College and a M.A. from Boston College. Being a Boston Red Sox fan since birth prepared him for the vocation of politics that Max Weber described as "a strong and slow boring of hard boards. It takes both passion and perspective." Email: richardcouto@comcast.net

SOME RIGHTS RESERVED

violence and its attendant terror. There can be no question that terrorism and violence and the state's reaction to them play an overwhelming role in politics today—in terms of who gets elected, on what platform, the over-arching global politics, and how that is driven currently by terrorism and the actions of the states and terrorists. While terrorists have gotten the attention of nation states around the globe, the emphasis on the psychology of terrorists obscures the political preconditions and precipitants—the indirect and direct political causes of terrorism and their political transformation—that are the focus of this paper. Thus, conceptions of terrorism, criminality, and violence, the nature of agents engaged in the politics of terror, how states react both internally and externally, all need to be examined. An examination of political and criminal violence leads to questions about deliberate and purposeful violence, indirect and structural violence that has political consequences, and their relationship to terrorism. It expands the application of terrorism to include indirect structural violence by indicating its relationship to direct violence, not only in traditionally-viewed terrorist action but in the ignored terrorism of, for example, inner cities. In so doing, this paper develops different realms of discourse about terrorism, violence, and political leadership to inform new political narratives and the development of political leadership.

The examination presents generalizations about terrorism—a form of political violence by, for, and against the state—and politics and violence. These generalizations are based on the theories of Max Weber and Hannah Arendt, and we begin the examination by juxtaposing their definitions and arguments to highlight fundamental contrasts developed throughout the paper. With those insights as a foundation for an analytical framework of political terrorism, the next part of the paper distinguishes deliberate and purposeful violence from unintended violence and political violence from the apolitical appearance of indirect (or structural) political violence. This offers a starting point for understanding political terrorism as a unique form of political violence. On that basis, in the next part we examine the scholarship on terrorism that will enable us to explain one aspect of political terrorism—the nature and role of political leadership within political terrorism. The final part is an examination of terrorism by, for, and against the state, including discussion of terrorism against the state as a reflection of terrorism by the state.

As an orientation to the interrelationships of concepts, arguments, and systems presented here, Figure 1 below supplies a mapping of the politics of terrorism elaborated in this paper.

Legitimate Authority / Justified Violence

Weber

Max Weber’s reflections on politics offer us a starting point to understand an analytical framework of political terrorism. In his profound essay, *Politics as a Vocation,* (1958), Weber explains that the general questions of politics as a vocation (political leadership) are not limited to the policies and questions of the day. In its broadest sense, politics comprises any *independent* leadership in action regardless of context. Thus we may have labor politics, family politics, and workplace politics. In its narrower terms, political leadership comprises the leadership, or attempts to influence the leadership, of a political association, a state (Weber, 1958, p. 77).

Figure 1. Conceptual Mapping of Politics of Terrorism

Weber defines the state by its distinctive means—physical force—not its purpose, which may be common to any number of other associations. The relationship of the state and violence is an "intimate" one, just as Tilly described, that defines the state for Weber as "a human community that (successfully) claims *the monopoly of the legitimate use of physical force* within a given territory (p. 78). The power of the state adheres to its right to permit groups and individuals to use physical force and to its claim as the sole source of the right to use violence. Politics, at root, "means striving to share power or striving to influence the distribution of power, either among states or among groups within a state." Part of the power of the state comes from establishing the legitimacy of its power so that it does not have to use the violence and physical force upon which it rests. Weber combines these definitional elements in sociological and powerful terms. "The state is a relation of men dominating men, a relation supported by means of a legitimate (i.e., considered to be legitimate) violence" (p. 78).

At this point, in his essay, Weber examines the sources of legitimate authority, which are familiar to students of politics.

- The eternal yesterday of tradition—traditional;
- Extraordinary and personal gifts of grace—charismatic;
- Legality premised on the validity of legal statute and functional competence premised on rationally created rules—legal (pp. 78-79).

One who is active in politics seeks legitimate authority through one of these avenues rather than justifying violence by invoking one or more of these forms of authority. The state's use of violence is not terror when it appears as justified by legitimate authority; a contestable terrain. It appears more clearly as unjustified violence and terror as groups understand legitimate authority as cultural and social subordination or when it attempts to eliminate legitimate opposition.

Weber spends considerable space outlining the preeminent qualities of a leader with a vocation for politics, that is someone who seeks power as a means to serve other ends and not merely self-gratification—passion, a feeling of responsibility, and a sense of proportion (pp. 115-116). These qualities, like all human qualities, are held together in paradoxical if not contradictory fashion. Weber identifies the puzzle as "how can warm passion and a cool sense of proportion be forged together in one and the same soul" (p. 116). The passion that Weber has in mind is a "matter-of-factness" passionate devotion to a cause. The cause, however, tempers the passion with a sense of proportion, which comes with an ability to keep some distance from things and people related to the cause, that is, the ability to remain objective and responsible. Weber does not quite solve the puzzle he put forward but he does make clear that solving this puzzle requires that power remains a means to serving some cause but that the cause does not become an end itself and the end is certainly not the vanity of the powerful.

Taken alone, the emphasis on passion, ideals, and cause in politics could support extremism. In his own time, Weber was concerned with the extremism of pacifism and a Christian ethic expressed in the Sermon on the Mount. Weber checks the possibility of passion, ideals, and cause becoming extremism by balancing the *ethos* of politics as a cause with an *ethos* of politics as responsible compromise and proportionate action. He contrasts an ethic of absolute or ultimate ends with an ethic of responsibility. The decisive distinction between them is consideration of consequences of action. The ethic of ultimate ends focuses on intention while the ethic of responsibility focuses on the foreseeable consequences of one's actions (pp. 119-20). "The believer in an ethic of ultimate ends feels "responsible" only for seeing to it that the flame of pure intentions is not squelched; for example, the flame of protesting against the injustice of the social order" (p. 121). Thus, suicide bombers may see their action as a means to protest injustice and to inspire others to similar protest with no attention to the real and human consequences of that action to others. The ethic of responsibility focuses on consequences. It examines all foreseeable consequences of an action and assumes responsibility for them. In balance then, the ethics of absolutes and responsibility require political leadership to cling to a cause—the purpose to which politics, power, and violence are a means—but to act responsibly—to examine foreseeable consequences, forego absolute and ultimate goals, and remain in touch with the consequences of violence—in pursuit of a cause.

The dilemma is not over for us or Weber, however. The nature of the state, a relationship of legitimate violence, may require pursuing good ends through "morally dubious means or at least dangerous ones" with evil consequences. Sadly, Weber observes, "From no ethics in the world can it be concluded when and to what extent the ethically good purpose ‘justifies’ the ethically dangerous means and ramifications” (p. 121). This brings Weber back to his premise that “the decisive means for politics is violence” (p. 121) to which he adds that in the experience of the irrationality of the world good consequences may come from evil means and evil consequences from good means. “The world is governed by demons and … he who lets himself in for politics, that is, for power and force as means, contracts with diabolical powers” precisely because of this irrationality of the world (p. 123). Later he adds, “He who seeks the salvation of the soul, of his own and of others, should not seek it along the avenue of politics, for the quite different tasks of politics can only be solved by violence…” (p. 126).

After all of this, have we come full circle? Do we return to a position that the emphasis on passion, ideals, and cause justifies extremism in political leadership, including the use of terrorism? It seems that the ethic of ultimate ends trumps an ethic of responsibility as long as political leaders are steadfast enough not to crumble in the face of a world too stupid and base for what they have to offer. Clearly, Weber did not mean to provide a justification of terrorism or pacifism. Mandela’s careful reasoning and distinctions, as we shall see below, also suggest that there is indeed a path for politics without terrorism and violent protest of authority and violence that he and others consider illegitimate.

Arendt

Hannah Arendt helps us to move beyond Weber to resolve the confusion of political terrorism and to separate the state from legitimate violence. She approaches the issue of legitimate authority and violence in a different manner. She is not concerned with the authority to claim a monopoly over the legitimate use of the violence but with distinguishing legitimate authority from violence. Arendt insists that the authority, strength, and power of the state rest upon its legitimacy, which gives it the power to foster collective action among its citizens. State violence, which may be justified, suggests that the state lacks sufficient legitimacy to gain citizen compliance through non-coercive power. Legitimacy, it would seem, resides in the second and third dimensions of power (Lukes, 1975) not in the first dimension of nonviolent and violent coercion.

Arendt discusses a range of human relationships in the realm of public affairs—“power,” “strength,” “force,” “authority,” and “violence” and uses the lack of clarity among them as a measure of the paucity of political science at the time (Arendt, 1969, p. 43). Moving from the most legitimate to the least—authority demands respect for and unquestioning recognition of the right to ask compliance without coercion or persuasion. Strength is a property inherent in a person or object and belonging to its character, separate from other things or persons. Its hallmark is independence. It contributes to the respect and recognition of authority; for example, the strength of the Constitution, a monarchy, or a particular person. Power is the human ability to act in concert. Force is the energy released by social movements and other concerted efforts in the environment of the state. Violence entails the reliance on implements of coercion, including physical force, to acquire obedience or compliance and to deny the power of others to challenge authority. It marks, actively or reactively, a recognition that some groups and individuals deny the authority and hence legitimacy of the state. In such a circumstance, the greater the use of violence against those who question its legitimacy, the more the government expresses its own doubt about the effectiveness and efficiency of its legitimate forms of authority, strength, and power. Pushed to an extreme, this violence becomes state terror. “Terror is not the same as violence; it is rather, the form of government that comes into being when violence, having destroyed all power, does not abdicate but, on the contrary, remains in full control” (p. 55).

Arendt brings us to the central point of a theory of politics and political terrorism. Power may have legitimacy if rooted in authority but violence may have only justification. When a state resorts to violence against its own citizens, it admits that it no longer has the strength and power of legitimate authority to command the compliance without coercion. Justification of this violence may appeal to the need to assert legitimate authority that needs less justification of its forms of nonviolent coercion. Paradoxically, the less violence the state uses, the less justification it requires and the fewer challenges it constructs to its legitimacy. The state’s power and authority are enhanced by treating political violence and terrorism as criminal violence and using the ordinary means of coercion and the least violence possible.

When a group resorts to terror against its own citizens or another state, it admits it does not have power or strength to use other forms of violence, such as guerrilla or conventional warfare, to challenge the legitimacy of the state. Its violence challenges the state’s authority over a monopoly of justified or, in Weber’s terms legitimate, violence. It justifies its own violence, terrorism, in the illegitimate authority or actions of the state which may include a disproportionate use of violence, which is an unjustifiable scale of it. In other words, the state use of violence, like the use of political terrorism against it, should be tactical, not strategic, and designed to demonstrate its power as legitimate authority not violence.

Thus, the essential part of the political leadership of counter-terrorism is to conflict successfully over the political nature of the violence used against it; over the justification of counter-terrorist violence; and the legitimate authority of the state, and, by implication, the purpose of politics. By separating violence from other aspects of political leadership, Arendt reaches a radical formulation of the relationship of power and violence.

Power and violence are opposites: where the one rules absolutely, the other is absent. Violence appears where power is in jeopardy, but left to its own course it ends in power’s disappearance. This implies that it is not correct to think of the opposite of violence as non-violence; to speak about non-violent power is actually redundant. Violence can destroy power; it is utterly incapable of creating it (p. 56).

As this examination of Weber and Arendt indicates, our challenge becomes being able to “read” this relationship between power and violence—direct violence and indirect structural violence—into real-life situations we confront at home and in the world, examples of which are discussed in the following sections as this paper’s examination continues.

The Politics of Terrorism

On the morning of September 11, 2001, my students and I were learning the unimaginable from a totally unfamiliar text. The policy and leadership class started shortly after the second plane hit the World Trade Center. I turned on the classroom television, and for 75 minutes, my

22 students and I alternately watched reports of the terrorist destruction of the World Trade Center and shared our ties with the people under attack and other background and personal information. News arrived of a crash into the Pentagon and of another airliner reportedly heading towards Washington, DC. Televised rumors flew around the globe, and our classroom, concerning car bombs at the state department. Who was behind this violence, we wondered. Fortunately, three out of four students could explain Al-Qaeda, its relationship with the Taliban, the nature of the Taliban, and their limited diplomatic recognition by other states.

We stared in disbelief as the South Tower collapsed. A student noted with reluctant recognition, “This is the defining event for my generation, just as the assassination of President Kennedy was for yours.” But how will it define this generation? Students and curricula face this important question. Clearly, we are at a crossroads for today’s generation of students. What markers do we give them for defining the nature of terrorism and for deciding what route to take in dealing with it?

Political and Criminal Violence

I began to formulate some answers to these and other, new questions several weeks later after reading a student’s journal about his community service. He described the inner-city middle school student he was tutoring and the different worlds they shared. The uncle of his young charge had been shot and killed the year before. My student reflected about parallel universes; one had violence-filled streets and one had child-centered, secure and safe neighborhoods. He lived in the latter and his student lived in the former. After September 11th, however, he and all of us knew that we live in one world with a shared vulnerability to terror and violence.

Will we make connections with the children of inner city Richmond and places like it? Will we wonder at and about the world of terror in which they and we live, just like my student’s student and my student? Will we reduce our newly discovered world of terror to individual extremists with psychological shortcomings, religious zeal, or misplaced national aspirations? Will we assume that terror grows from hatred of a people for their virtues, such as freedom and hard work, and jealousy of the fruits of their virtues, such as prosperity and strength? Will our search for security lead to a repression of civil liberties in this country and an imperialistic new world order abroad? Will we defend our democratic institutions with democratic processes and replicate the Marshall Plan to build nations with economic security and peaceful intentions?

Amid this host of questions, I had a solid starting point to analyze the terror that we now knew, firsthand: the root of terror is violence—actual or threatened, real or implied, physical and mental. In October 2002, random shootings in the Washington, D.C. area filled millions of Americans with terror. Fatal violence could enter the everyday chores of shopping, working, eating out, or pumping gas. We may also find forms of everyday and frequent violence, which approximate terror, outside of the attention-getting dramatic episodes. Juveniles detained by courts, for example, leave no doubt that the children of our inner cities are no strangers to violence. Detained juveniles in Richmond, Virginia, for example, recounted their direct experiences with homicide victims and the sound of gunfire in their neighborhoods at least twice monthly. The boys described a world in which being the target of gunfire is part of life’s uncertainty. Just as most people know that the next time they cross the street they may be hit by a car, these boys believed that the next corner they turned might be their last. The girls' stories described a world in which violence in the home occurred all too often. The detention center offered some of them the most security they had ever known. Americans, especially the children of our inner cities, know violence-related terror.

Statistics suggest that our inner-city children know more violence-related terror than areas of the world often cited as vortexes of terrorism. The annual number of homicide victims in Richmond in the 1990s, for example, exceeded the number of victims in all of Northern Ireland's terror for every year since 1972. In 1998, the number of juvenile homicides alone in Richmond (11) surpassed the number of total homicides in Belfast (10). James Gabarino (1999) terms the neighborhoods where these children live "war zones." Poverty, unemployment, poor schools, low educational attainment, and fractured families have shockingly high rates of occurrence. Every year, the children living in war zone neighborhoods across our country experience violence in an up close and personal way when someone they know becomes a murder victim. The aggregate figure of inner-city murder victims in the United States exceeds the shocking toll of September 11th, annually.

Why is the carnage of September 11th terror and the carnage of our inner cities not? Because of the singular nature of that day and its many victims? Perhaps. But why then are the protracted incidents of violence with few victims in Northern Ireland acts of terror but the killings of inner city Richmond not? Clearly, there are similarities. They all entail violence, actual or threatened, real or implied, physical and mental**.** In all these cases, some people, without provocation, had their lives taken or faced life-threatening circumstances; for example, the child, sitting on her front steps, fatally wounded by a stray bullet. Still, we do not call such tragic occurrences terrorism. even though terrorism seems to involve violence towards people innocent of any direct provocation or of any direct responsibility for injury to the perpetrators of the violence. Why are victims of terror the workers of the World Trade Center and the people who lost their lives trying to rescue victims, but not the little girl on her front steps?

The answer may lie in the motives of the perpetrators of violence. Perpetrators of terrorism are deliberate in their use of violence against innocent victims. Unlike the young gunman of the inner city whose errant gunshot hits a young girl he does not know, terrorists intend to kill or injury people whom they do not know. Unlike the young gunman, again, the terrorists' injurious and murderous act has a public purpose and not just a private or personal purpose. When the first plane hit the World Trade Center, for example, it was not clearly an act of terrorism. It could have been an accident or a deranged pilot intending a suicide/ mass murder. Only when the second plane hit the World Trade Center was it immediately clear that these acts were purposeful as well as deliberate acts of violence although what purpose they served was not clear.

We need to distinguish among unseen, public, and political forms of deliberate acts of violence. Violence may be used deliberately for the purpose of robbery or within a family to punish or hurt a person for submission. Rape is another form of deliberate violence. The snipers of the Washington area also had a deliberate public purpose—to extort a fortune to get them to stop their killings. In contrast, the people of the World Trade Center were the victims of deliberate and purposeful violence by men with a political purpose.

Thus, the discussion of political terrorism must begin with the recognition that some forms of violence are deliberate and purposeful and others are not. Some deliberate and purposeful acts of violence are directly political and some are not—robbery and extortion, for example. Acts that may be terrorism in one context, presidential assassination attempts, become apolitical crimes of violence when they spring from a deranged mind—John W. Hinckley, Jr.'s attempt to take the life of President Ronald Reagan and the later attempt on Gerald Ford's life by Charles Manson's devotee Lynette "Squeaky" Fromme. Some forms of violence, such as U.S. "war zone" neighborhoods, may be political in an indirect deep sense of public morality and hidden dimensions of power. They are the logical consequences rather than the intentional and deliberate purpose of the state. Pierre Bourdieu refers to these forms as indirect and structural violence of the state (Bourdieu, 1977, p. 192).

This examination of political and criminal violence leads us to questions about deliberate and purposeful violence, indirect and structural violence that has political consequences, and their relationship to terrorism.

Political Violence and Terrorism

There are several forms of directly and explicitly political violence. When one state undertakes deliberate and purposeful political violence against another state we may call it war and a just act (Stern, 1998, pp. 17-19) even though its purpose, and certainly its consequence, may include terrifying a civilian population and its military and political leaders into submission; the much vaunted "shock and awe" strategy of the second U.S./Iraq war fits here. Within war some forms of violence are more legitimate than others (Carpenter, 2002). In general, for example, civilian populations are to be spared from military violence. However, since at least Sherman's March through the South and certainly in the era of total militarization, achieving civilian protection has become more and more difficult as civilians become part of the infrastructure of the military. In the era of total war that marked most of the twentieth century, Saddam Hussein could find ample precedent for his attack on the Kurds in Northern Iraq during the Iran-Iraqi war and in the aftermath of his defeat against allied forces in the Gulf War. The expanded vulnerability of civilian populations in the war efforts of their governments may explain why the civilian casualties in Iraq, including increased infant mortality—an estimated 500,000 children—resulting from the economic sanctions imposed by the United Nations, do not cross the political terror threshold.

Some forms of wartime political violence do cross over into terror, however. Rape was an instrument of terror in Serbia. The United States used nuclear weapons on two Japanese cities just as Germany bombed civilian populations of the United Kingdom in World War II, and the allied forces firebombed Dresden. How do we distinguish these acts of war from other acts of war and from other forms of political violence? How do we justify one and not the other since both take and risk the lives of noncombatants? It seems clear that the purpose of war is to determine who will set the conditions for the cessation of armed conflict, the resolution of the conflicting states' aims and policies that provoked armed conflict, and the terms of the relationship of the warring parties after the war.

Distinguishing deliberate and purposeful violence from unintended violence and political violence from apolitical and indirect (or structural) political violence, offers us a starting point for understanding political terrorism as a unique form of political violence. Next, we examine the scholarship on terrorism that will enable us to explain one aspect of political terrorism—the nature and role of political leadership within political terrorism.

Terrorism by, for, and against the State

Whether conducted by or against the state, terrorism entails the intentional targeting of civilian populations (Laquer in White, 2002, p. 75) with real or threatened violence (Jenkins in White, 2002, p. 8) to bring about a climate of fear, emotional exhaustion, and a lack of will to continue to resist demands placed upon the public (Crenshaw, 2002, p. 101). Political terrorism may be used by the state—Stalin's purges of the 1930s (Moore, 2002, p. 65; Arendt, 2002, pp. 33-34) or against the state—the Irish Republican Army (Crenshaw, 2002). Paramilitary groups, such as the armed wings of the Unionist parties of Northern Ireland or the death squads of Central American, may also use violence for the state. Al-Qaeda represented a new form of terrorist group, an international terrorist group with the support of a state but not conducting violence directly for it. The Bush administration responded by including host countries as targets in a war on terrorism. We will deal with terrorism by and against the state primarily. Before taking up their distinction, we will explore what both forms of terrorism have in common.

Political terrorism, whether by or against the state, is inversely related to power. Ted Gurr explains terrorism as a tactic used by the weak to intimidate the strong and by the strong to intimidate the weak (Gurr in White, 2002, p. 205). Terrorism as a tactic against the state indicates a lack of the power to conflict with the state in "higher" levels of violence such as guerrilla or direct warfare. When a state resorts to tactics of terror against its own citizens, it undermines the power and legitimacy of its own civil and criminal processes or their waning power to enforce order without resort to violence. Stalin's show trials, Saddam Hussein's elimination of political opponents in and outside of the Baath Party, and his attacks on the Kurds illustrate a lack of legitimate authority to achieve a political purpose. Similarly, when vigilante groups or "death squads" undertake political terror for the state, that is to root out political opposition to the state, they too express the inadequacy of the power of the state, albeit frustration with the cumbersome nature of legitimate forms of authority, power, and coercion.

Gurr explains terrorism as a tactic but it may also be a strategy. Rather than an order of armed violence lower than guerilla and open warfare, terrorism may be a new level of protest, that is violent protest, to demonstrate the vulnerability of the state and its citizens and publicize a group's or individual's new or continued opposition to the state. State terrorism, unlike the terror of sub-state groups, may eliminate political opposition and not just express resistance to them. In either case, terrorism separated from power takes on the character of a strategy more than a tactic, becomes more clandestine, and requires less organization and leadership. As a strategy, terrorism risks losing sight of its political purpose, however, and losing sight of any strategy to achieve it.

Political terror is much more likely to be successful as a tactic in a larger strategy and when its consequences for strategic goals are thought out and apparent. Political terror, when adopted as a strategy, suggests that the connection of means and ends are not well thought out or apparent (Crenshaw, 2002, p. 107). Political terror against the state may even bring on popularly supported repressive measures when the terror seems without purpose, a strategy not a tactic, or when the tactical goals lack significant support in the general population. The state may safely deal with the violence of strategic noninstrumental terrorism, especially by its own nationals, as criminal violence rather than political terror. Examples are the violence against clinics and individual providers of abortion services, the Symbionese Liberation Army, or Aum Shinrikyo's release of sarin gas in the Tokyo subway. When the state escalates the nature of a criminal threat to a political threat by moving from nonviolent to violent coercion, for example the siege at the Weaver property at Ruby Ridge and the assault on David Koresh's Branch Davidian sect, it justifies the use of strategic terror against the state in the minds of chiliastic and infeasible revolutionaries. Repressive measures by the state that exceed proportionality, such as the British repression of the Easter 1916 Rebellion in Dublin by artillery, the execution of IRA leaders, and the imprisonment of thousands of followers and its later use of Black and Tans forces, may permit tactical terrorists to increase their violence to guerilla warfare because of increased popular support and justification (White, 2002, pp. 84-85).

Terrorism, whether as a tactic or a strategy, entails a rational choice that may have a wide range of political goals: revolution, right and left; counter-revolution; nationalist; separatist; millenarian or reactionary; gaining or retaining political power; anarchy and totalitarianism; etc. (White, 2002, p. xviii). The connection of terror to a broader political goal may be well-thought out but tactically unsound or poorly conceived and a strategy in itself (Crenshaw, 2002, p. 107). However well developed its political goal may be, if it has little feasibility of being understood, shared, or achieved, then the tactical political value of terrorism decreases. However rational, terrorism is a "cultural performance with intense symbols and historical references" that intends a "culturally embedded, absorbing and transforming symbolic constructs of reality, morality, and truth" (Besteman, 2002, p. 2, 6). Victims of political terrorism have little intrinsic political value (Crenshaw, 2002, p. 99). Their death and injury are more important to express symbolically the danger to random and ordinary citizens (White, 2002, p. 21), the power of the terrorist group to inflict harm; the sophistication and cunning of their methods; and the revenge they seek to exact or purpose to achieve (White, 2002, p. 198). Beyond inflicting or threatening physical harm, the tactic of terrorism is a calculated rational choice of dramatic episodes to achieve particular political goals (Besteman, 2002, p. 2; Crenshaw, 2002, p. 100) by "the systematic inducement of fear and anxiety to control and direct a civilian population" (Crenshaw, 2002, pp. 100-101). The World Trade Center and its destruction was a symbol for the terrorists who attacked it and for subsequent U.S. counter-terrorism against them. Bob Woodward closes his panegyric on President Bush's leadership in the Afghanistan war with a scene of 25 men from Special Forces units and CIA paramilitary teams in Afghanistan. They "dedicated" this spot with an American flag and a pile of rocks assembled as a tombstone over a piece of World Trade Center debris.

> One of the men read a prayer. Then he said, "We consecrate this spot as an everlasting memorial to the brave Americans who died on September 11, so that all who would seek to do her harm will know that America will not stand by and watch terror prevail. We will export death and violence to the four corners of the earth in defense of our great nation." (Woodward, 2002, pp. 351-352).

Political terrorism, especially as a tactic, whether by or against the state, draws from a deep well of preconditions (Crenshaw, 2002, p. 101; White, 2002) such as historical events and conditions, the interpretation of which legitimate political violence as counter-terrorism or revenge. The preconditions of political terrorism—hunger, poverty, illness, illiteracy, large-scale unemployment, cultural subversion—will have conflicting meaning and interpretations of their origins. For some, these preconditions represent indirect and structural forms of political violence of the state; for others, they represent direct forms; political violence by the state may take on direct and indirect forms (Besteman, 2002, pp. 303-304). Colonialism, for example, provides a form of indirect political violence that the state attempts to obscure behind justifications that assert superiority and inferiority of some groups (Orwell, 1936). When a group feels unjustly deprived by indirect, legal violence, elites within that group may act in violent and nonviolent ways to resist the laws and the states (Crenshaw, 2002, pp. 103-104).

Advocates of political violence against the state, at least in the case of colonialism, such as Frantz Fanon (1963) and Albert Memmi (1991), explained the colonized and the colonizer as reflections of the same violence. Explaining the difference between them explains the indirect and structural violence, of which Bourdieu speaks; the misery of the colonized is justified by some attribute of the colonized, for example cultural superiority or good intentions. Fanon and Memmi understand state violence to extend to the attribution of the conditions of stark inequality and privilege to the psychological nature and abilities of the different groups. They suggest that the psychological explanations of terrorism have political origins and are part of the resistance to the power of the privileged to oppress others. That power extends to the second and third dimensions of power and their capacity to shape the self-consciousness of the less powerful, the feasibility of change, and the efficacy of protest (Lukes, 1975; Scott, 1990). Fanon cites a World Health Organization scientist who, after examining Africans in the Center and East of Africa described them as “lobotomized Europeans” (Fanon, 1963, p. 302). Sartre took from Fanon’s writing insight into the violence of the colonizer, including rationalizations of the privilege of the European in their superiority over the colonized and the need of continued suppressive violence (Sartre in Fanon, 1963). In Fanon and Memmi, and others (Orwell, 1936), we find a political origin, in the precondition of oppressive violence, of some of the psychological generalizations of the terror of the powerless. As Sartre rhetorically argued, “You say they understand nothing but violence? Of course; first, the only violence is the settler’s, but soon they will make it their own; that is to say, the same violence is thrown back upon us as when our reflection comes forward to meet us when we go toward a mirror” (Sartre in Fanon, 1963, p. 17).

Often a spark ignites a round of political terrorism by the state. On October 23, 1989, a white couple was shot in the racially mixed area of Mission Hill in Boston. Carol Stuart, pregnant, died on the scene and her baby died several weeks later. Her husband Charles claimed a black man with a raspy voice shot them. His charge set off a police search that terrorized the black community. Charles Stuart later committed suicide when it became clear that he had shot his pregnant wife in the head in an attempt to collect insurance. He wounded himself, as part of a cover up, and had selected the location of the murder and the false description to play on the underlying racist assumptions of the Boston police and others according to the wounded husband (Kasiecki, 2000).

The spark that ignites terror may have very indirect ties to preconditions such as racism and sexism. A precipitating event may have roots in conflict for support among competing political groups or in the internal needs of a group for control, discipline, or morale building (Crenshaw, 2002, p. 108). The African National Congress, for example, had pressure to adopt some form of political violence because of the Pan African Congress. Ariel Sharon visited the Temple Mount, in part, to demonstrate the harder line of his Lihkud Party towards the Palestinians than that of Ehud Barak and the Labour Party, then in power. His visit was both a matter of Israeli internal politics and a provocation of militant Palestinian groups (Mitchell, 2001, p. 5).

Terrorism against the State

Tactical and strategic terror against the state have correlates with the size of terrorist groups, the nature of their leadership, and the feasibility of their political goals. Ted Gurr points out most terrorism against the state comes from small, short-lived groups that do not pose a serious threat to the state (White, 2002, p. 33). Extreme terrorists who portray their crusades as a cataclysmic clash of civilizations and in some form of eschatological drama (White, 2002, pp. 49-50) are least likely to provide a convincing link between terrorism and some achievable political goal. Terrorism becomes more "legitimate" the stronger its leadership forges links to connect its political violence and broadly shared political goals such as nationalism, separatism, democratic participation, anti-colonialism, self-determination, or even theocracy (White, 2002, pp. 49-50). The possibility of a group's successful political terrorism against the state hinges on the potential acceptance of its legitimacy and its claims that there are no alternatives to violence (Crenshaw, 2002, p. 114). A small terrorist group with little chance of bringing about a political or social change, such as the Weathermen of the 1960s, will more often use terror as a strategy. An inchoate goal for the strategy of terrorism reduces its adherents. This in turn reduces the need for organization and thus leadership; Ted Kaczynski, the "Unabomber" conducted a one-person campaign of political terror. In contrast, a larger group with hope in achieving broad political and social change, such as the Irish Republican Army under Michael Collins, is more likely to use political terror as a tactic (White, 2002, pp. 78ff).

The rational choice of terror against the state incorporates the weakness and intentions of terrorist leadership. It falls on a spectrum between disorders and riots on the one hand, and on the other guerilla war, low-level war, limited conventional warfare, and unlimited conventional warfare (White, 2002, p. 13). Its premeditation and symbolic nature separate terrorism from riots and its relatively low-level of violence separates it from forms of war (Crenshaw, 2002, p. 99). Small extremist terrorist groups may express leaderless resistance to some part of state policy, such as the conduct of legal abortions (White, 2002, p. 43). These terrorist groups require less organization (White, 2002, p. 43) because the strategy of terrorism more resembles violent disorder and riots. The strategy of terrorism, however, also indicates the relative weakness of a group and its incapacity to conduct violence by traditional military means. The state may ordinarily use this weakness to depoliticize the violence of small extremist groups and to portray it as criminal rather than political violence (White, 2002, pp. 269-271).

As a tactic, rather than a strategy, terrorism resembles more the conduct of warfare and thus requires more leadership and organization. It is likely to be a calculated choice and imply the inefficacy of legal redress and the unlikelihood of successful violent revolution (Crenshaw, 2002, pp. 103-105). Michael Collins and the IRA provided a model for later terrorists by following state officials, police, and intelligence officers, to their homes and murdering them there. He thus sought to demonstrate the vulnerability of the state and its agents. Collins's actions in the Irish Rebellion would inspire the later actions of Jewish terrorists—Irgun Zvai Leumi—to hasten the partition of Palestine (White, 2002, p. 100). As a tactic, terrorism seeks to build power so that its armed and violent resistance may move on to the next level of guerrilla warfare. Political terrorism against the state may gain power by an attrition that saps the will of the state to continue resisting the political and social changes sought. The success of the Ku Klux Klan from 1869 to 1876 in the American South (Couto, 1991, pp. 222-228) and the Irgun Zvai Leumi's terrorism against the British in Palestine (White, 2002, p. 100) offer good examples of success by attrition. Its success as a strategy depends upon its ability to win adherents to the belief that there is no legal redress available (Moore, 2002, p. 63) and that the group's terror is a temporary tactic until there is sufficient strength to wage guerrilla and then perhaps conventional warfare, and then to establish legitimate government. The success of terror as a strategy depends in great measure upon the use of violence by the state.

Terrorism by the State

Terrorism by the state indicates its own relative powerlessness, specifically the inadequacy of the state's civil power to maintain order (White, 2002, p. 277) or the inadequacy of the civil power to curb violence that is waged against it without criminalizing and restricting some previously legal and permitted conduct. Legal and extralegal repression of a group by the state or its agents may inculcate terror—feelings of fear and vulnerability—and measure the preexisting indirect and structural violence of the state. The South African government's laws banishing the ANC and increasing criminal acts for their seeming political intent, Sabotage Act (1962) and General Law Amendment Act (1963), illustrated the underlying violence for Africans and the international community (Johns & Davis, 2002, p. 91). Lynching, the war on drugs, and the police rampage in Roxbury all remind African-Americans and other racial minorities of preexisting indirect and structural violence of the state.

Too much state violence undermines a minimal framework of regularity and legality (Moore, 2002, p. 66). Even nonviolent actions of public officials that remind a group of its claims of the oppressive preconditions of violence may precipitate new terrorism against the state, as when Ariel Sharon's visit to the Temple Mount on September 28, 2001, sparked a renewed intifada (Mitchell, 2001).

One enabling condition of the terrorist violence against the state is its own practice of violence. The death penalty, for example, sanctions the taking of life. In the case of DC snipers, the *Wall Street Journal* editorialized that capital punishment struck the balance of justice. Capital punishment provides a legal justification for a cultural and social value of holding grudges and an underdeveloped sense of justice as retribution. Both of these factors provide an environment of the social acceptance of violence that may influence terrorists. Violence as an instrument of justified vengeance was also the choice made by Timothy McVeigh in the aftermath of United States' government action against unlawful but nonviolent conditions at Waco, Texas and Ruby Ridge, Idaho. These latter actions still provide "ammo" for the "revolution" of "freedom fighters" (Revolution, 2007), a group that may range from libertarians to violent opponents of the

U.S. government. The state's use of violence is endemic in the formation of nation states of the modern era. The state develops the capacity to use violence "on a larger scale, more effectively, more efficiently, with wider assent from their subject populations, and with readier collaboration from neighboring authorities" than other groups within the same territory (Tilly, 2002, p. 38). The greater its success in monopolizing violence, the more clandestine and apparently criminal, not political, will violence against it appear. The small and clandestine nature of terrorist groups enables them to function (Crenshaw, 2002, p. 103) but also limits their threat to the state (Gurr in White, 2002, p. 33).

These links of state actions, social acceptance of violence, and terrorism against the state have particular and ironic application at the present time. Al-Qaeda and the leadership of Osama bin Laden have direct links to the support that the United States government gave to the Mujahadin during their resistance to the Soviet invasion of Afghanistan in the 1970s (White, 2002, pp. 162-163). Similarly, the threat that Saddam Hussein posed to the United States and its allies had direct bearing on the support that he received from the British and United States governments during Iraq's war with Iran (Pelletiere, Johnson, & Rosenberger, 1990). The deposition of Saddam Hussein's regime did less to inspire terrorism against occupation forces than the inability of the provisional authority to provide security against criminal violence (Couto, 2003, pp. 22-24)

Other state action may stimulate or increase political terrorism. For example, if countermeasures of the state to forms of resistance, violent and nonviolent, exceed existing legal measures or appear disproportionate to the threat of violence against the state, they may serve as indirect or direct forms of state terrorism and engender sympathy and support for violent and nonviolent resistance. Unexpected and unusual violence by the state to quell protest and dissent may be a precipitating cause of terrorism against the state (Crenshaw, 2002, p. 105). The South African government's excessive violent responses to demonstrations in Sharpsville and later in Soweto illustrate this possibility. The policies of the state greatly influence the growth in numbers and popular acceptance of terrorist organizations (Crenshaw, 2002, p. 114) and may help move them from terrorists to guerrilla forces.

The state may enable its own terrorism as well as terrorism against it. For example, the repression of legal avenues to address grievances of a large portion of the population permits state violence against a portion of it. As Barrington Moore points out in his assessment of the terrorism of the Soviet Union, "Whatever destroys the play of interest groups within the society and permits a single group to dominate inevitably destroys the only realistic guarantee that organized violence will not be used against dissenting persons or groups in the society" (Moore, 2002, p. 63). Moore uses Stalin's purges and the forced collectivization of the farmlands of the kulaks to illustrate this point (Moore, 2002, p. 62).

States may embrace organized terror from a crusading spirit that comes from "the fanatical conviction in the justice and universal applicability of some ideal about the way life should be organized along with a lack of serious concern about the consequences of the methods used to pursue this ideal (Moore, 2002, p. 64). In practice this organized terror of the state represents the effort "to alter the structure of society at a rapid rate and from above through forceful administrative devices" (Moore, 2002, p. 64) Moore uses Stalin as an example and is generally concerned with the question of terror and socialism (Moore, 2002). Pol Pot’s Cambodia suggests another form of state terror on behalf of socialism, albeit inchoate. Pinochet’s terror in Chile makes clear that state terror may be linked to capitalism as well as socialism. Mao Tse-tung used state apparatus from above to mobilize the masses below to renew revolutionary fervor. Saddam Hussein used violence to eliminate political opponents and the Baath Party to consolidate and maintain his power by terror. Ethnic cleansing in Rwanda, Serbia, and other nations suggest another purpose of organized state terror. Terror is a necessary counterpart to a cult of infallible leadership that prevents alternative appraisals of a situation (Moore, 2002, p. 66). We will have more to say on this later as we discuss the role of folly in political leadership. The excesses of crusading terrorism have far more devastating consequences when conducted as organized state terrorism compared with the efforts of fringe and clandestine groups opposed to the state.

Terrorism against the State as a Reflection of Terrorism by the State

Perhaps the clearest statement of terrorism against the state and as a reflection of the violence by the state comes from political leaders who embraced violence reluctantly and disavowed terrorism deliberately. In his April 20, 1964 trial, Nelson Mandela explained the role of violence in the African National Congress strategy of resistance and distinguished it from terrorism. He explained that a month after Sharpeville, the ANC formed Umkhonto we Sizwe (Spear of the Nation). At Sharpeville on March 21, 1960, the Pan African Congress organized a nonviolent demonstration against the passbooks that controlled the movement of Africans within their own country. Police fired into the crowd and killed 69 people. Mandela explained that this violent repression of nonviolent protest gave the ANC no choice but to respond to violence with violence. After decades of nonviolent protest of laws seen as unjust, the government had legislated against such protest defining them as a particular form of criminal activity with additional penalties, and then, at Sharpeville, “resorted to a show of force to crush opposition to its policies.” “…Only then did we (ANC) decide to answer violence with violence” (Mandela, 1964; Johns & Davis, 1991, p. 117).

> Mandela then painstakingly distinguished among forms of political violence, explained the strategy of political violence, and maintained that although ANC embraced violence as a political tactic, it disavowed terrorism.
>
> Four forms of violence were possible. There is sabotage, there is guerrilla warfare, there is terrorism, and there is open revolution. We chose to adopt the first method and to exhaust it before taking any other decision.
>
> In the light of our political background the choice was a logical one. Sabotage did not involve loss of life, and it offered the best hope for future race relations. Bitterness would be kept to a minimum and, if the policy bore fruit, democratic government could become a reality. This is what we felt at the time, and this is what we said in our Manifesto (Exhibit A, D):
>
> "We of Umkhonto we Sizwe have always sought to achieve liberation without bloodshed and civil clash. We hope, even at this late hour, that our first actions will awaken everyone to a realization of the disastrous situation to which the Nationalist policy is leading. We

> hope that we will bring the Government and its supporters to their senses before it is too late, so that both the Government and its policies can be changed before matters reach the desperate state of civil war."
>
> The initial plan was based on a careful analysis of the political and economic situation of our country. We believed that South Africa depended to a large extent on foreign capital and foreign trade. We felt that planned destruction of power plants, and interference with rail and telephone communications, would tend to scare away capital from the country, make it more difficult for goods from the industrial areas to reach the seaports on schedule, and would in the long run be a heavy drain on the economic life of the country, thus compelling the voters of the country to reconsider their position.
>
> Attacks on the economic life lines of the country were to be linked with sabotage on Government buildings and other symbols of apartheid. These attacks would serve as a source of inspiration to our people. In addition, they would provide an outlet for those people who were urging the adoption of violent methods and would enable us to give concrete proof to our followers that we had adopted a stronger line and were fighting back against Government violence.
>
> In addition, if mass action were successfully organized, and mass reprisals taken, we felt that sympathy for our cause would be roused in other countries, and that greater pressure would be brought to bear on the South African Government.
>
> This then was the plan. Umkhonto was to perform sabotage, and strict instructions were given to its members right from the start, that on no account were they to injure or kill people in planning or carrying out operations. These instructions have been referred to in the evidence of 'Mr. X' and 'Mr. Z'. (Mandela, 1964, n.p.).

Oliver Tambo, Mandela’s law partner and leader of the exiled ANC, also clearly explained violence as a tactic of resistance while clearly distinguishing ANC’s policy of “controlled violence” from terrorism. Even in the 1980s, when the ANC encouraged intensified violence, it explained this policy as guerrilla warfare and maintained an emphasis on violence as sabotage, while admitting that the threat of death and injury to innocent people and agents of the state existed in any form of violence (Tambo, 1983). The ANC eventually, in 1988, repeated its disavowal of terrorism and the intentional targeting of civilians by more radical element of Umkhonto we Sizwe (Johns & Davis, 1991, p. 312).

> The strategic outlook we project and encourage is one which focuses on mass struggle against the apartheid regime for the liberation of our people. There can be no question of agreements with anybody outside of this framework. As we said before, our activists, whether functioning at the legal or the illegal level - and we have to function at both these levels - adhere to our strategic concept of drawing the masses of the people into conscious, organised, and united action. Functioning at both these levels, it is their task to win into one common front of united action all organisations that are opposed to the apartheid system and are fighting for genuine national and social liberation (Johns & Davis, 1991, p. 240; Tambo, 1983).

Although regarded by many to be the epitome of an international standard for peace and reconciliation, Mandela’s use of violence raised the specter of terrorism for others. In Northern Ireland, for example, peace advocates, in the 1998 campaign on the referendum on the Good Friday Accord, sought a headliner to attract attention and supporters for a yes vote on the referendum. Campaign organizers considered Nelson Mandela for that role but decided against pursuing the invitation very far because of their efforts to win over moderate Protestant voters, middle-Unionists. That group’s largest fear was that the new political arrangements of the peace accord would release the terrorists of the IRA from prison and that they would come to power. For the middle-Unionists, Mandela had a paramilitary history and was now in power; exactly what they feared Sinn Fein leaders might do in Northern Ireland. The labyrinth of political violence and the state brings us back to the question of political leadership and the justification of political violence with which we began.

Conclusion

Through an understanding of power as authentic leadership by legitimate authority, and violence as a sign of a breakdown of power, leadership, and legitimacy, we begin to create narratives that formulate other choices to violence and its attendant terror. In addition to historical examples of political violence, our inner-city children also teach us how to end a spiral of terror and violence. That narrative begins with the insistence that there are other choices to violence and its attendant terror to gain what we want. They tell us that those who turn to violence think that “Once you got a gun, you’re on top of the world” (Couto & Stutts, 2000, p. 3). To this assessment, we make a counter call “…Out of the barrel of a gun grows the most effective command, resulting in instant and perfect obedience. What can never grow out of it is power” (Arendt, 1969, p. 53).

The politics of terrorism suggest a central counter-terrorist approach: de-politicizing the violence of terrorists whenever possible and using the authority and power of the state to treat it as criminal violence. It also means politicizing the justifications of violence, such as capital punishment, and their indirect and structural forms, such as the inner city. The implications for political leadership could not be greater.

Adult Development Theory and Political Analysis: An Integral Account of Social and Political Change in Soviet and Post-Soviet Russia

Elke Fein[1]

Abstract: I propose a reading of social, political and discursive change in Soviet and post-Soviet Russia which is inspired by an integral, above all developmental perspective. In view of explaining Russia's current political trajectory, I make several arguments. First, I claim that Russian politics are still to a large extent determined by the effects of a threefold crisis of sense-making. Neither the collapse of the Soviet empire, nor the question of how to define democratic government nor the lack of a resilient national identity have so far been resolved and re-appropriated in a transformative manner. Second, I try to show how this affects various aspects and dimensions of Russian politics. Third, I engage in a brief overview of a number of adult development models, asking to what extent and how the characteristics of consciousness development, particular stage characteristics, and the general logics and dynamics of successful and unsuccessful development these models describe can be helpful to the analysis of Russian politics. Also, I discuss their compatibility and parallels with discourse theory and analysis as an increasingly popular methodology in Russian Studies. Of the developmental models reviewed, the theory of political development by Stephen Chilton and the self-protective action logic in Susanne Cook-Greuter's model of self and identity development are particularly relevant for my purpose. On these grounds, it is argued that since Vladimir Putin's taking office as Russian president and later prime-minister, politics and (official) political discourse have increasingly come to follow self-protective action logics as conceived by Susanne Cook-Greuter. This diagnosis, which could either be understood as a regression or as a realignment of internal and external dimensions of political development, can be explained as a reaction to Russia's crisis of identity followed by a loss of internal stability and international influence connected to the dislocations mentioned above.

Keywords: Adult development theory, complexity, development, discourse analysis, discourse theory, dislocation, identity, levels of consciousness, Russia, self-protective stage, social science.

Introduction: Whither Russia?

Social scientists dealing with the process of regime transformation in post-Soviet Russia are increasingly struck by what in many respects looks like a move "backwards," towards illiberalism and authoritarianism. Almost ten years after Vladimir Putin's advent to power as Russian president and now prime minister, however strong and stable the regime might appear,

SOME RIGHTS RESERVED

liberal democracy seems to be more unlikely than ever before in the whole period of post-Soviet transformation. Even though democracy, modernization, and the rule of law have constantly been part of the official political language in Russia during the past two decades, all of these terms currently have to be interpreted through specific discursive frames such as the discourses of Eurasianism or of "sovereign democracy," claiming that Russia was a civilization of its own and either must not copy western ideas, standards, and institutions or could not afford this kind of "luxury." Even though some observers still hope that president Medvedev could eventually "emancipate" the country from the most illiberal aspects of Putin's heritage, it remains unclear for the time being in which direction Russia's transformation is heading. So how can this political and cultural trajectory be explained? And how could we (that is both academic observers and political actors inside and outside Russia) possibly come up with constructive strategies to deal with these developments on a political level?

The following reflections are based on my almost 15 years of personal and academic preoccupation with political and cultural developments in Russia, during which I took a special interest in Russia's way of relating to its Soviet past after the collapse of the Soviet Union. Born and socialized in Germany, my main focus of interest has always been the connection between Russia's political development and her ways of dealing with the country's non-democratic and totalitarian experiences of the 20th century. Having gained increasing familiarity with integral, and, in particular, developmental approaches during the past years, it seems a fascinating and challenging endeavour to combine the two research trajectories, which the following contribution attempts to do.

In this article, I claim that Russian politics are still to a significant extent determined by the after-effects of the largely non-digested, multi-dimensional crisis of sense-making (dislocation) connected to the collapse of the Soviet Union in 1991, influencing many aspects of socioeconomic, political, and cultural life, and discussed in the first part of the article. Since the impacts of emotionally "undigested" experiences of dislocation[2] tend to manifest themselves in largely unreflected, subconscious mechanisms (Mitscherlich, 1967; Schwan, 1997), a significant section of my article is devoted to reviewing theories of consciousness as a device for inquiring into the realm of these invisible, yet powerful spheres, in order to make visible at least some of their workings and logics. On these grounds, I would like to propose a theory about where Russian politics and society are in this regard and why. On the basis of structural models of adult development (such as those of Piaget, Neo-Piagetian approaches to the development of political culture, and in particular Susanne Cook-Greuter's model of self-development), supporting meta-perspectives on social and cultural change, I would like to propose a more integral way of explaining social and political change in post-Soviet Russia.

Besides, I argue that developmental theories show multiple parallels to and compatibilities with well-established social science theories and methods, namely discourse theory and analysis, while at the same time transcending the overall outlook of the latter, discussed in the second part of the article. Affording interesting new perspectives on current developments in contemporary Russia, they could therefore enrich sociological and discourse analytical accounts of the deeper, structural levels and mechanisms of cultural and discursive change.

---

[2] A term coined by Ernesto Laclau and Chantal Mouffe in their discourse theory (see below), meaning crisis of sense-making on a larger, collective (cultural) level.

Thus, my overall aim in this article is twofold: first, to summarize and review basic concepts and assumptions of some developmental approaches in order to discuss their value for political analysis of societies in transition in general and their parallels with and analytical “surplus value” for discourse theory and analysis, especially in the tradition of Ernesto Laclau and Chantal Mouffe, in particular. Second, I propose an integrally informed account of political and cultural change in post-Soviet Russia on the basis of an adult developmental theory perspective, covered in the third part of the article.

Dislocation and Politics in Transitional Russia

At the beginning of post-Soviet Russian history was a fundamental, at least threefold dislocation (crisis of sense-making), the scope and implications of which probably still have not been fully grasped or integrated by a significant number of either the leading political actors or the majority of the Russian population.

The dislocation of the Bolshevik Soviet state ideology (1), a long and subtle process which began in the early 1960s, subsequently lead to a steady erosion of power of the Soviet model of leadership and rule (2) during the 1970s and 80s and culminated in the collapse of the Soviet Union (3) in result of Gorbachev’s politics of Perestroika. A glance at post-Soviet Russia’s social and political trajectory during the past two decades shows that none of these three dimensions of what was probably the most important dislocation of the second half of the 20th century has so far been fully re-appropriated politically, culturally, and emotionally.

During the 1990s, the most decisive experience for the majority of the population was that of chaos and lack of leadership in the realm of political organization, and of social and economic degradation, in result of which ideas like democracy, freedom, and market economy were strongly delegitimized. This made it easier for political actors to declare these ideas to be western inventions, foreign and hostile to Russia.

Now, during the past ten years, the country has rather experienced what looks like a move back towards Soviet habits and patterns of political thought and action in many regards. While ideology, for example, has indeed been officially banned from state politics by Russia’s 1993 constitution, the government under Putin has made increasing efforts to regain control over public and cultural realms through control of the media, campaigns against critical literature, and attempts to regain hegemony over the construction of historical truth (Mommsen & Nußberger, 2007). This includes a revaluation of Stalinism and mourning the end of the Soviet Union. In this context, it is not surprising that a balanced, unemotional national debate about how to evaluate and which lessons to learn from the Soviet experience has so far been difficult. At heart, only with regard to the collapse of the Union has the political class begun to engage in an open, nationwide debate about which consequences should be drawn from it. This debate, however, is mostly characterized by geopolitical logics of strategic influence and interest rather than by engaging in a more thorough and outright inventory of the situation. On these grounds, it seems that official political Russia is making only the very first steps of a long and probably difficult process of re-appropriating the dislocative experience connected to the end of the Soviet era.

Dislocations as Chances for Political Transformation, Development and Cultural Growth

By re-appropriation, I mean the socio-political and psychologico-cultural process of de-identifying with a *subjective* or *intersubjective* experience through gradually turning it into an *object* of perception and reflection. Developmental researchers in the tradition of Robert Kegan (1982/1991) have described this psychological process as taking a critical distance towards what was taken for granted before, so that it gradually becomes visible as a separate object which the (collective) subject can relate to, reflect about or learn from. Growth, according to Kegan, always includes a process of de-identification, differentiation, and of unhinging out of a former embeddedness, which he calls decentering (losing an old centre of the self) – and of a subsequent recentering around a new system of (inter-) subjective balance. According to Kegan, "development is defined by creating objects (a process of differentiation) and relating to them (a process of integration)," so that on each new level, the projected ambivalence diminishes and we concede to the world a bit more identity of its own. With each new level, the individual thus perceives the world a little more as an entity that is different from and independent of him or her self (Kegan, 1982/1991, pp. 55, 95, 112, 140).

For our topic here, this means that only if such a critical, objectifying distance has been established, can experiences be reflexively re-appropriated, their invisible power be dissolved, and they themselves eventually be integrated on a higher level of learning, development, and being. If, in contrast, a distance of de-identification, differentiation, and objectivation is not taken, the experience in question is likely to continue to exercise power over the (inter-) subjective perception of self and identity; in other words, the memory and the logics of reasoning and interpretation connected to it continue to determine thinking and action as the only available construction of the real (see Wilber, 2006). It is therefore plausible that the deeper a traumatic or the more radical a dislocative experience, the more time, psychic energy, and strength it takes to go through the process of transformation, de-identification, and critical re-appropriation.[3] Transformation is thus conceived here as a substantive *vertical* development in the sense of a qualitative learning and growth process, making critical and constructive use of experiences by transcending and including them into broader, more complex, more differentiated and thus more adequate new solutions, worldviews, orders of reasoning and conceptions of one's own self as opposed to mere (*horizontal*) "change."[4] Understood in this way, the empirically observed solutions/worldviews/orders of reasoning and self-conceptions can be analyzed qualitatively, focusing on their degree of complexity, and on evidence of their re-appropriating and integrating past experiences. This analysis can make use of the categories provided by adult development theories as proposed in the next part of this paper.

---

[3] See Schwan (1997) and Markus Wehner (Frankfurter Allgemeine Zeitung's former correspondent in Moscow) who wrote that Russia was "a country without memory. To confront the past could reduce the certitude to be on the right track. German Vergangenheitsbewaeltigung appears as a masochistic act, foreign to the Russians. Their past is too cruel and too close" (Markus Wehner: Hauptsache frei. Russland feiert, egal was, warum und wie, aber am liebsten im Mai, in: Frankfurter Allgemeine Zeitung, 4.5.2002).

[4] See Kegan 1982/1991, pp. 118 and 121. This is in line with Stephen Chilton's discussion of the term development (Chilton 1988a), see below.

Political Culture

Developmental complexity, however, is not merely a relevant category for analyzing public discourse[5] and culture but can also be applied to other factors of political analysis like economic and institutional change or the behaviour of political elites. While an integral approach is bound to take into account all of these dimensions at an equal rate, analyzing political culture appears to be a particularly pertinent strategy in contexts of instability and transition. Since culture is where peoples' understanding of their behaviour becomes visible, the cultural system in some sense "mediates the micro-macro relationship" of individual systems of belief and action on the one hand, and the social system on the other. Because changes in the cultural system (as part of the internal realm in Wilber's terms) are for the most part closely related with factors from the external realm, the study of political change, according to Chilton, must start with the cultural system (Chilton, 1988b, pp. 141ff.,154).

Political Culture as Mediator of Micro and Macro: An Example from Russia

As an example illustrating both the complexity of public reasoning and its interdependence with political, cultural, and institutional change (in other words, interior and exterior structural variables and conditions of political development) let me briefly refer to a previous study on Russia's dealing with its Soviet past (Fein, 2007). Through a discourse analysis (in the tradition of Foucault and Laclau/Mouffe) of the so-called CPSU-trial between Yeltsin and the former communist party at Russia's Constitutional Court in 1992, I could demonstrate that the discursive struggle for hegemony about the Soviet past had important consequences not only for the re-definition of Russia's discursive regime on a more general level, but also for the development of attitudes, political behaviour, and for the working of political institutions in the following years. In a nutshell, my analysis brought forward two interesting and connected insights, first with regard to structural developmental complexity, and second, with regard to the relation between interior and exterior determinants of political development. As to the first aspect, it was most stunning that although Yeltsin's team had all the archival evidence to prove that the CPSU systematically violated both the constitution and its own law, the discourse voiced by the communist camp still "won the game" – and that this was due less to legal and judicial arguments, but more to a discourse based on a specific type of moral and even emotional reasoning. Their arguments involved putting goals above means, ideological conformism above individual freedom and legal responsibility, faith in communist dogma above the requirement of critically questioning alleged "truths" in the face of a contradicting reality.[6] By sanctioning this kind of reasoning as a legally valid option, the Court de facto rehabilitated – and thereby made hegemonic – the cognitive patterns, values, and attitudes of a rather egocentric, partly conformist, partly self-protective discourse.

---

[5] The term "discourse" is understood here as a "differential ensemble of signifying sequences" giving meaning to our speech acts, thoughts and actions, while this meaning is constantly renegotiated (see Torfing, 1999, pp. 84-85). However, discourses try to stabilize meaning and signifying orders at least temporarily and thus, to establish an intersubjectively binding order of knowledge within a social whole (see Keller, 2004, p. 7).

[6] To name only some of their successful discursive strategies, the communists presented themselves as "victims of history" who were not to be blamed for the outcomes of communist rule because, firstly, the communist idea itself was humanistic ("we always wanted the best"), thus claiming that the violent excesses of Soviet history were only unintended side-effects. Goals, in other words, were placed above means. Secondly, they argued that the so-called "simple communists" could not be held responsible for the deeds of the Party leadership, since the former had nothing but a very general idea of what the latter

The political aftermath of this ambivalent “founding myth” of post-Soviet Russia made clear that this had far-reaching impacts. Besides showing the difficulties that official Russia had to come to terms with, with regard to its Soviet past, this outcome also affected fundamental political issues, such as the dominant conception of democracy/political rule and national identity (see discussion below) and thus the overall direction of reform. For with a largely self-referential, self-protective discourse based on an attitude of victimization coming out as the de facto winner of the discursive struggle, more developed discursive positions were marginalized and lost legitimacy. On the level of political identity, this created a serious problem for the official “Democratic Russia,” since even though its leadership still preached democratic change, it had lost an important source for legitimating this change. With the communist past and its vague, “user-defined” notions of justice and democracy rehabilitated, why should the country need any other kind of democratization at all? So, even without gaining complete political hegemony itself, the partly conformist, partly self-protective discourse voiced in the context of the trial in 1992, along with its system of metaphors, images, and cognitive frames, successfully prevented more self-reflexive, that is, more complex (more differentiated and integrative) and as such, more developed and more “mature” political and psychological logics, practices and positions (such as taking responsibility for one’s history, coming to terms with past experiences and traumas and discussing possibilities of reconciliation and reparation) from defining the horizon of meaning. And of course, this immediately affected the functioning of politics on a larger scale.

The second aspect of my analysis therefore concerns the impacts of the discursive hegemony sanctioned by the Court on political correctness, political behaviour, and institutional logics until today. In sum, the “paralysis” of official political discourse on Soviet history between past and future (“like a lift stuck between two floors”) increasingly came to paralyze political development altogether. Since there was no consensus among the leading actors and elites about the value of the democratic institutions introduced by Russia’s first elected president, and thus, about the rules of the political game, formal institutions came to be devaluated in favour of unofficial and extra-constitutional practices of organization and policy making (Shevtsova, 1999, 2003).

This finding is in line with Chilton’s (1988a, p. 110) account of political development, holding social development to be dependent on “a nation’s widespread recognition of its own culture’s ambiguities and contradictions,” and cognitive development to “occur only when the reasoner finds and resolves ambiguities and contradictions within her own cognitive structure.” In contrast, the majority of Russia’s elite either did not perceive an ambiguity at all or lacked the inner strength and/or potential to overcome self-protective logics and frameworks of reasoning through more complex and integrative ones. From a developmental perspective, this evidence can be conceived either as a way of defending a particular system of meaning and action against a more complex reality (Kegan, 1982/1991, p. 225), or as a regression to a less complex and

---

was doing. Thirdly, the communists asked the Court to recognize the “positive sides of history,” thereby demanding, again, to be freed from responsibility.

therefore less demanding level of political existence. This evaluation depends on how the situation in the Soviet Union is assessed. Anyway, the system that came out of the 1992 compromise can be described as a mixture of stage 2 and stage 3 arrangements as described in Chilton's work further below (Table 2), namely patron-client-relations, clientelism, barter, or "blat." Similar mechanisms have in fact been identified as widespread phenomena by political analysts of both Soviet and post-Soviet Russia (Pleines, 1998, 2005; Ledeneva, 1999, 2000; Lehmbruch, 2005; Schröder, 1998; Volkov 2005).

In a more general sense, my example therefore shows that institutions can function only according to the level of developmental complexity of cognitive structures and habits available to the subjects who sustain them. Even if there are proponents of more complex practices and rationalities within the respective society, yet outside of the institutions in question, the latter are likely to adopt their functioning to the dominant level of development. My study thus confirms Chilton's statement that "unless the institution's structure is preserved by people at the appropriate stage, the institution will regress to less developed forms" (Chilton 1988a, p. 88). The following section outlines several adult development theories that appear particularly valuable for analyzing political and cultural transition in general and for discourse analysis in particular.

Adult Development Theories for Discourse and Political Analysis

> *Nations, as well as individuals, can be categorized according to their level of existence.*
> *– Clare Graves, 1974*

Quite obviously, the assumption of levels of development has interesting consequences not only for psychological theorizing but also for cultural and political analysis and for policy making in general. With regard to my example above, even psychological lay people would probably agree that self-reflexive efforts to confront past crimes and traumas constitute a more complex, more differentiated and thus more developed way of dealing with a criminal and traumatizing past than trying to whitewash, repress, or relativize it, for example by setting it off against the "positive sides of history" or by denying or avoiding questions of responsibility. The theory of developmental complexity underlying this claim is inspired by decades of developmental psychological research and can draw on a wide range of well-established, field-tested empirical knowledge, both from developmental psychology of the individual, such as of Jean Piaget, Lawrence Kohlberg, Robert Kegan, Abraham Maslow, Jane Loevinger, Susanne Cook-Greuter, and from pioneers of developmental approaches to (political) culture such as Jean Gebser, Clare Graves, Jürgen Habermas, Shawn Rosenberg, Stephen Chilton and Dana Ward. Their findings are supported also by more traditional research of cultural change such as that of Ronald Inglehart (1977) or Paul H. Ray and Ruth Anderson (2000).

While most of the developmental researchers have focused on a specific aspect or dimension of development, such as cognition, morals, self-identity, values, and needs, due to different interests and assumptions concerning the importance and relationship between these dimensions, they seem to indicate more or less stable and inherently consistent structures of development.

Furthermore, at least Kohlberg's model has been tested in different cultures with empirical research supporting an intercultural validity of its levels or stages.[7]

Developmental Approaches and Analysis of Post-Soviet Russian Politics

Being unable to do justice to the variety of research that has already been done in the field, I shall limit myself in this article to a brief review of some of those approaches that appear most fundamental to my own research.

Piagetian developmental psychology of individual cognition

Most fundamental per se, and as a source for many of the more recent developmental approaches is Jean Piaget's model of the development of cognition which he called a "genetic epistemology" (Piaget, 1970). The model concerned "with both the formation and the meaning of knowledge" (Piaget, 1970, pp. 12-13) distinguishes four major levels (sensorimotor, pre-operational, concrete-operational and formal-operational), characterized by a successive decrease of egocentrism and, in turn, by a more developed capacity of abstraction and of integrating more perspectives into one's outlook on the world as development proceeds. Originally stemming from Piaget's observation of children's cognitive development, his findings have proved to be valid and applicable to adults as well. Empirical evidence shows again and again that the fourth stage, classically identified with the cognition of the "mature adult human being," is not reached by a significant number of average adults during their lifetime.

Piaget's genetic epistemology is a basic reference in the field, since the general structure and "quality of reasoning exist independently of the object of thought" (Rosenberg, 1988a, p. 89); in other words, because cognition is at the basis of all other dimensions of consciousness development and, in result, of that of more practically relevant interaction capacities such as moral thinking, self-identity, values and reasoning.

Perspectives on social and cultural development

Early concepts of cultural development using categories of hierarchical complexity (see Commons & Richards, 1984) include those of Jean Gebser, Clare Graves, and Jürgen Habermas. Jean Gebser in his master work *Ursprung und Gegenwart* (1949) has given a phenomenological account of "traces of unfolding consciousness in culture," identifying five subsequent structures of consciousness, each of which continues to operate in the context of the next higher one as development proceeds. Clare Graves (1970, 1974), inspired by his colleague Abraham Maslow at Union College in Schenectady (N.Y.), theorized that in interaction of internal neuronal systems with external conditions humans develop new bio-psycho-social coping systems to solve their changing existential problems. He believed these evolving coping systems ("levels of existence") and their underlying motivations to manifest as (mostly subconscious) value systems at the individual, societal, and species levels.[8]

---

[7] For a review of cross-cultural tests of Piagetian theories in general, see Dasen (1977). Also see: Edwards (1975), Kohlberg (1981), Kohlberg, Levine, & Hewer (1984), Nisan & Kohlberg (1984), Weinreich (1977).

Jürgen Habermas (e.g., 1976, 1981, 1983) is famous for his reading of social and cultural history as a process of increasing emancipation from preconventional/archaic and conventional/traditional to more rational structures of thinking and acting in the course of social and cultural modernization and "enlightenment." Habermas draws, amongst others, on the developmental psychologies of Piaget and Kohlberg and on evolutionary accounts of social organisation and of the history of law. All of these sources can only be mentioned here without a more thorough discussion. An overview of their models and stages is given later in Table 4.

Neo-Piagetian approaches to reasoning, cognition, and political development

Despite his unquestioned merits, Piaget has also been criticized for underestimating the role of social environments in the individual's construction of meaning (Rosenberg 1988a, p. 89). As a consequence, Neo-Piagetian researchers such as Shawn W. Rosenberg, Dana Ward and Stephen Chilton have focused on both the social and political implications of Piaget's levels of cognition and on the role of what Robert Kegan (1982/1991) has called the "embedding cultures" of each level of development. Rosenberg is mainly cited for his model of reasoning structures, especially designed for analysing political reasoning. As such, the three stages identified by him when analyzing political discourse are of particular interest here.

Table 1. Rosenberg's Levels of Political Reasoning

Stage Name[a]	General Stage Description
Systematic	Context-aware, search for systematic relationships between phenomena; able to reflect subjective and objective conditions of phenomena and their relationships; high ability of abstract classification and theory-building
Linear	Causal thinking, search for unidirectional causal explanations; understanding is based on concrete experiences rather than on reflection; able to build abstract categories based on experiences, limited ability to make generalizations
Sequential	Concrete, proximate perception and understanding; absence of abstract thinking; able to perceive and describe sequences of events without grasping general patterns, causes or interrelations between them

Note: Compiled on the basis of Rosenberg (1988a).
[a] Listed from more complex to less complex stages.

The empirical case studies exploring ways of political reasoning as conducted by Rosenberg and others on the basis of this typology confirm the importance of structural differences in thinking and argumentation independently of a particular content (Rosenberg 1988a; Winterstein, 2005).[9]

---

[8] Practitioners drawing on Graves like Don Beck and Christopher Cowan hold Graves' cultural stage model to be applicable to conflict resolution in communities, cities, movements, ethnicities, entire countries, as well as defined populations and cultural regions. See: http://ja-jp.facebook.com/note.php?note_id=123355875206.

[9] For analyzing political reasoning, the integrative complexity model also has to be mentioned. Developed in the 1960s, it has been applied extensively in empirical studies on political psychology, focusing on the cognitive integration of competing perspectives. Influenced by Piaget, it is not grounded in a normative

Scott Karl Winterstein, a pupil of Rosenberg, has distinguished four structural levels of discourse in his dissertation (Winterstein, 2005) based on Rosenberg's and other typologies. His model is primarily oriented towards analyzing oral interpersonal face-to-face communications though (which he basically does through simulation experiments) and is therefore more difficult to use for political analysis.

One of the most elaborated Neo-Piagetian theories of political development was proposed by Stephen Chilton (Chilton 1988a, 1988b, 1991 and Rosenberg, Ward, & Chilton, 1988). Motivated by the experience of the USA's failure to "import" their model of democracy to Vietnam, Chilton engages in a thorough and systematic discussion of concepts and dynamics of political development including a criticism of those proposed by mainstream political science. He argues that the term "development" makes no sense without a normative notion of "higher" stages of development as psychologically being better integrated, philosophically more moral, and therefore also morally "better:" "To say that one form of society is better than another is to say that if its members recognize the difference, they will try to create the better and not the worse" (Chilton 1988a, p. 12, 14).

Chilton has come up with what he calls a "speculative classification of social forms" (Table 2) in which he associates ideal-typical social institutions with each stage of Kohlberg's moral and interpersonal development scale. He argues, first, that politics is always connected to moral reasoning and evaluation and that therefore "any theory of political development must contain a psychological theory of moral reasoning (Chilton 1988b, p. 159). Because according to Chilton, "the criteria for the goodness of a political culture are the same as those for the goodness of an individual's moral reasoning... we can fairly say that for a political culture to be more developed is in fact for it to be better" (Chilton 1988b, p. 157). Second, Chilton claims that the social institutions brought forward by each stage of development are content-independent universal structures, and that therefore "different cultures *can* develop along different developmental paths – of different *content*, that is, *but not of different structure*" (Chilton 1988a, p. 104; emphasis added). His classification, referred to earlier, will be helpful in the analysis of Russian politics.

Finally, Chilton's and his colleagues' considerations about the dynamics of and the relation between social and political development processes are of great interest to my own analysis. Chilton insists that "a society" must neither be regarded as an organism which develops as a whole nor its development be conceived simply "in proportion to the average level of its members' development" (Chilton 1988b, p. 128). Rather, he stresses the importance of subcultures as "cultural analogues of cognitive developmental decalages" and as a sign of ongoing transition (Chilton 1988a, p. 93). He therefore also focuses on the potential differences between the average level of development and the level from which a society is ruled. Based on an analysis of social interaction as the basis of both individual moral and of political culture development, he urges for a subtle consideration of the specifics of individual and cultural developmental dynamics.

---

model of development though and does not analyze the structure of reasoning or the character of the epistemological self. Rather, its adherents point out that although an important analytical category, high integrative complexity is neither "inherently desirable", nor is it "more moral, more perceptive, or more likely to lead to successful solutions" (Suedfeld, cited in Jordan, 2000, pp. 10-11). See also Suedfeld (1994), Suedfeld & Tetlock (1977, 1992), and Wallace, Suedfeld, & Thachuk (1993).

Table 2. Chilton's "Speculative Classification of Social Forms"

	Kohlberg's Descriptive Stage Title	Interpersonal Relations/ Forms of Influence	Associated Social Institutions
6	Universal ethical principles (second-order Golden Rule)	*Satyagraha; agape*; undistorted communicative action; mutual care	(none currently known)
5	Prior rights and social contract or utility	Mutual respect; rational debate, fair competition, and scientific testing	Democracies protecting civil rights and liberties; due process; capitalist market economies; "normal science"
4	Social system and conscience maintenance ("law and order")	Mutual support of moral system	Modern army; bureaucracy; fascism; tyranny of majority rule; absolutism
3	Mutual interpersonal expectations, relationships and conformity (the concrete Golden Rule)	Friendship; *compadrazgo*; romantic or courtly love	Medieval towns; social patronage or client system; late-medieval aristocracy; estates (*Staende*); dualistic *Staendestaat*; corporatism
2	Individual instrumental purpose and exchange ("what's in it for me?")	Barter and trading; deterrence by revenge; bribery; corve labor; prebend; curses; feudal fealty and vassalage	Early feudal system; exchange patronage systems; tax farming; hostages
1	Punishment and obedience ("Might makes right")	Domination; physical compulsion; threats; seizure by force; extortion	Pecking order; slavery; prison and other total institutions

Note: Reproduced from Chilton (1988a, pp. 43, 68), with permission of Stephen Chilton © 1988. Available at http://www.d.umn.edu/~schilton/Articles/DPD.html.

Even if cultures in some regards appear more flexible in their development due to the dynamics of their social and cultural composition and subcultural decalages,

> Stage skipping is not possible when a culture first develops to a specific stage. Just as each cognitive stage must build on the one before, each new level of culture must grow out of the one immediately previous. No matter what the cognitive levels of the individuals are in the society, they would appear to need time to work out the practical social problems of one level of development before proceeding to the next.
>
> One can imagine, however, that stage skipping would be possible in certain other circumstances. If a culture were conquered by a two-stage-lower culture and were shortly thereafter freed, the first culture would be able to spring back to its original stage. The longer the second culture's domination lasted, however, the less likely such a return would be: children would increasingly orient to the new culture and would be unsure how to relate in the old culture; and the changes accumulating with the new regime would make the exact restoration of the old regime ever less appropriate. (Chilton 1988a, p. 97)

The following considerations are immediately applicable to Russian and Soviet history. Even if, according to Chilton, societies, for example after a revolutionary or foreign take-over, they

> …cannot go back(wards) and pretend that (previous upward; EF) changes have not taken place … political cultures can regress if the average adult moral reasoning stage declines, because then fewer higher-stage people are there to support the previous high levels and more lower-stage people fail to understand it. (Chilton 1988a, pp. 95, 97)

This relationship is further elaborated by Rosenberg who adds that

> extreme inequalities of power have the same effect on adult's ability to role-play. That is, if socialized in the context of subordination, particularly when that subordination includes little peer interaction, adults will exhibit little ability to role-play, with all consequences, including unilateral respect for authority. Environmental opportunities for role-playing are very much dependent upon power relations. (…) The greater the disparities of power and the fewer the available roles in a society, the fewer the incentives and the more difficult it becomes to step outside one's own particular position. (Rosenberg, 1988a, p. 170)

At the same time, high levels of morality would be necessary to challenge authority.

Since the primary purpose of this article is to apply these and other selected insights of adult development theory to the analysis of Russian politics, a more detailed and systematic literature review regarding this issue has to be postponed for another article.

Kegan's Subject-Object Logics and the Epistemological Self

While some characteristics may differ between individual and collective/political development, the basic subject-object mechanism of differentiation (decentering) and integration (recentering on a higher level) as described by Kegan is the same in both cases.[10] As the previous section has already made clear, neo-Piagetian approaches for the most part do not limit themselves to cognition properly speaking, but build their theorizing on cross-relations between cognition and other dimensions of development, above all moral reasoning and the development of self and/or identity. The later is important to be included as a widespread element of post-Soviet political discourse in Russia.

While Piaget insisted that "there are not two processes of development, one cognitive and one affective; there are not two separate psychic functions, and not two forms of objects: all objects are cognitive and affective at the same time" (as quoted in Kegan 1982/1991, p. 120), Kegan remarks that Piaget did not fully measure up to this claim in his own work. Kegan has therefore put the main focus of his own research on the development of the ego or (epistemological) self as "that who speaks and/or acts," holding that "every step/every stage can be viewed as the result of a single, fundamental process of development" (Kegan, 1982/1991, p. 106). This has immediate relevance to our understanding of processes of dislocation and transition in the course of which not only complex reasoning but also self-images and identities are often severely shattered. A fine summary of Kegan's stage model is given by Jordan (2000).

---

[10] The most abstract model of development is the general stage model (Editor's note: General stage model was an earlier name; it is now titled the model of hierarchic complexity) by Michael L. Commons and Francis A. Richards (1984) which is also increasingly being applied to political analysis (Commons & Goodheart, 2007; Ross, 2007; Ross & Commons, 2008).

For our purpose, Kegan furthermore provides a powerful support of the interrelatedness of inner psychic and interpersonal reconstructions in that he stresses the crucial role of “embedding cultures” for development – and failing development. Similar to Chilton, he strongly pleads in favour of viewing personal psychological and socio-political development jointly. He calls separating them “a result of theories the basic concepts of which are too narrowly framed” (Kegan, 1982/1991, pp. 134, 283).

Susanne Cook-Greuter’s action logics

Finally, my account of Russian politics draws heavily on Susanne Cook-Greuter’s concept of action logics, an advancement and differentiation of Jane Loevinger’s model of self development (Table 3). Cook-Greuter’s central interest is in ego or self-development or in “how human beings respond to life” (Cook-Greuter, 1990, p. 79). Similar to Kegan, she views self-development as composed of several strongly interrelated components (operative/behavioural, affective, and cognitive): “Each stage emerges from a synthesis of doing, being, and thinking” (Cook-Greuter, 1990, pp. 80, 85). Similar to Kegan, Rosenberg, Chilton and Ward, she sees the human individual as an essentially social being dependent on a “human context,” since both meaning-making and meaning-maintenance are possible only within a socio-cultural community (Cook-Greuter, 1990, p. 81).

As self and identity are largely communicated through language Cook-Greuter measures both of them by an elaborated sentence completion test (SCT) in which, as a matter of fact, the social context can sometimes induce individuals to respond lower than their usual level with regard to issues which put them into emotional stress or in order to avoid uncomfortable answers. This problem can be avoided by discourse analytical uses, that is, by applying Cook-Greuter’s stage model and scaling method to text and interview material.

Table 3. Cook-Greuter’s Action Logics

Stage #	Stage names	Description of stage characteristics
6	Unitary (Ironist)	Aware of ego formation, self as construct/in transformation; different paradigms compared; beginning ego transcendence; self in flux; transpersonal self
5/6	Construct-aware (Alchemist)	System of sub-personalities: coherent self-identity, permanent core elf across time
5	Autonomous (Strategist)	Different selves at different times, several sub-personalities, relativity of self-sense
4/5	Individualistic (Individualist)	Self as system of roles; clusters of traits with past and future; prototype personality
4	Conscientious (Achiever)	Clusters of attributes, simple traits; beginning introspection; separate personhood
3/4	Self-conscious (Expert/technician)	Several external features; simple roles; rudimentary internal states
3	Conformist/rule-oriented (Diplomat)	Single external feature; beginning comparisons

Stage #	Stage names	Description of stage characteristics
2/3	Self-protective (Opportunist)	Basis dichotomies; single, concrete feature; minimal self description*
2	Impulsive	Rudimentary self-labelling (physical), crude dichotomies
1	Symbiotic	Confused, confounded
0	Pre-social	Autistic, undifferentiated

Taken from: Cook-Greuter (1990, p. 104; 2007).
* The self-protective stage is described in more detail below.

Readers who are primarily interested in my reading of Russian politics can skip the following section and jump immediately to the third part of the article.

Parallels with Discourse Theory and Other Methodological Considerations

In his review of four developmental frameworks and their value for geopolitical analysis, Thomas Jordan has provided a comparative discussion of the main methodological approaches used in the field (Jordan, 2000, section 4). As geopolitical research follows similar trajectories to my own, I refer to Jordan’s overview here. As the most important methodologies to inquire into structures of development in the social and political sciences, he specifies the following.

1. Interviews, either as rather open (but then highly skill-dependant) subject-object interviews (used by Kegan and associates) or as more standardized “Kohlberg-type interviews” where the participant is asked to reason about a particular moral dilemma; Jordan was also experimenting with subject-object interviews via e-mail.
2. Sentence completion tests (SCT, used by Loevinger, Cook-Greuter and others).
3. Simulations in real life contexts (used by Winterstein) or controlled experiments.
4. Text analysis, applicable to both published texts like newspaper articles, official statements, declarations etc. And to transcribed speech and interview material (used by Rosenberg, Chilton and the integrative complexity research).

In line with Jordan, I hold a mixed approach (both in theoretical and methodological regard) to be most adequate to analyzing Russian politics. While interviews and SCT, as compared to text analysis, are very sophisticated and focused instruments allowing rather deep insights into reasoning logics, due to the possibility of probing (SCTs are therefore often combined with interviews), they also have disadvantages. Just like simulations, both are by definition limited to populations agreeing either to respond to interview questions or to fill out the SCT form. Text analysis, in contrast, has the advantage of operating independently of the consent of the subjects of research, and thereby avoids selective results and situationally determined fake behaviour. Especially in simulations, participants sometimes also either have difficulties to play roles they are not identified with or tend to avoid uneasy issues. Another advantage of analyzing existing textual material is the possibility to include high-level decision makers who would otherwise not be available for clinical interviewing (Jordan, 2000). The last point seems particularly important in view of analyzing Russian politics.

Among the strategies of text analysis, discourse analysis has an explicit interest in identifying structures of reasoning. And among discourse theoretical perspectives, those inspired by Foucault's theory of power appear particularly adequate for social and political analysis because of their interest in the social implications of hegemonic constructions and definitions of truth. Therefore, I will now look at how discourse theory and analysis can profitably be connected with or adapted to theories of development.

In view of parallels between discourse and developmental theory, four aspects appear relevant: first, the open character of both discursive change and development; second the relation between structures and content of reasoning; third, the conception of multiple levels of development or discourses competing for hegemony within the same society; and fourth, the role of crisis of sense-making as central triggers of change.

The Open Character of Change and/or Development

What many of the developmental approaches in the tradition of Piaget have in common is their notion of human consciousness "as an open, constantly evolving system" of unfolding complexity, "a system which proceeds by quantum jumps from one (more or less; EF) steady state system to the next through a hierarchy of ordered systems." As articulated here by Clare Graves, "the psychology of the mature human being is an emergent, oscillating, spiralling process marked by progressive subordination of older, lower-order behaviour systems to newer, higher-order systems as man's existential problems change" (Graves, 1974, p. 72).

Here, we have a first parallel to discourse theory. Similar to adult development theorists who reject the idea of an end of development called the "mature human being," discourse theory as understood by post-structuralist and Foucauldian theorists like Laclau and Mouffe[11] also incorporates the idea of discourse as an "open, constantly evolving system." The posit that humans have an "*ever* emergent" personality able to go through potentially infinite processes of learning thus coincides with the discourse theoretical assumption that discourses are able to, and actually do, permanently adopt their capacities of problem solving and symbolic sense-making to the respective problems and challenges by gradually integrating new information and novel ideas.

A difference, however, is that developmentalists conceive of the levels they found in their empirical data as *vertical* stages of *growing complexity*, instead of as *horizontal* types of mere pluralist *difference*. Since on each new level, the individual is able to take a wider, more complex perspective than on the previous level (see my use of the term re-appropriation below), later cognitive/identity/values frames include earlier ones, whereas on earlier, less complex stages, the options of the more complex levels are not available. This also implies that while "at any given level, an individual exhibits the behaviour and values characteristic of people at that level, a person who is centralized at a lower level cannot even understand people who are at a higher level"

---

[11] For a more detailed introduction please confer Butler, Laclau, & Zizek (2000), Keller (2004), Kerchner & Schneider (2005), Laclau (1990, 1994, 2002), Laclau & Mouffe (2000), Torfing (1999).

(Chilton, 1988a, p. 82), whereas this is not true the other way round.[12] This, I claim, could be an interesting research trajectory to be included in the analysis of discursive power struggles.

The Relation between Structures and Content of Reasoning

While discourse theory in the tradition of Foucault, as a constructivist perspective, similar to developmental theories focuses on the theoretical conditions, social mechanisms, and structural characteristics of discursive struggles and change, it has so far not provided—and not tried to provide—a framework for describing or explaining the (potential) evolution of empirical discourses in a qualitative way; that is, of increasing or decreasing structural complexity. One reason for this may be that post-structuralist discourse theory as a product of postmodern, constructivist anti-essentialism (often implicitly) implies a certain relativism, and therefore tends to operate mainly on the *horizontal* level. This is true both for its interest in substantive and in structural phenomena. In other words, it observes empirical discourses, compares and analyzes their content and interior structures, as well as the strategies put forward by them in their struggle for hegemony over other discourses. As a formal, anti-essentialist theory however, discourse theory does not assume or look for qualitative hierarchies and distinguishing factors other than that of successfully or not successfully gaining discursive hegemony.[13]

At this point, adult development perspectives offer additional insights by distinguishing more or less complex forms and patterns of reasoning related to consciousness (cognitive, moral, identity, etc.) and cultural development. Their interest being in formal, structural characteristics (*how* does the person think or argue? *How* do they do what they do? *How* do they believe that which they do believe) rather than in substantive positions (which values does someone have, what does the person think/feel/need or do?), instruments for analyzing structural logics and dispositions focus on vertical and horizontal aspects at the same time.

For discourse analysis, this means that the same discursive position can be asserted by people at different levels of reasoning and argumentation – with very different results. It also means that you can talk about the same topic both from various (*horizontal*) discursive positions and from different (*vertical*) levels of perception, reasoning, and argumentation. For example, going to war can be justified by either pre-conventional reasoning (arguing that this might benefit one's own economic or security interests) or by post-conventional reasoning (arguing that one had to defend certain general principles such as protecting human rights). At the same time, the universal principle of human rights can also be used as a post-conventional argument against going to war (since killing people is a clear violation of their rights).

---

[12] Chilton more specifically argues that because reasoners are "to some degree susceptible to guidance by +1 reasoners," it is adequate for political leaders to "reason up to two stages above many of their followers. They must reason no more than one stage above the attentive public" which, in turn, "must reason no more than one stage above the inattentive public, if its members wish to remain opinion leaders" (Chilton, 1988a, p. 82).

[13] The only exception I can see is Critical Discourse Analysis (CDA) with its pretension to be critical of power structures in an emancipatory sense. CDA claims that its own emancipatory perspective is a "better," "more truthful" or more adequate strategy to picture and eventually change social and political reality than that of the discourses it analyses. Similar hierarchical assumptions are sometimes inherent also in other discourse analytical research agendas, implicitly holding post-materialistic attitudes to be more "advanced" or desirable than materialistic ones, for example. In a developmental research design as proposed here, in contrast, these distinctions are explicitly spelled out and put into the centre of research.

Multiple Levels of Development or Discourses Competing within the Same Society

Similar to developmental perspectives where multiple levels of development are likely to be found *within* the same social or cultural realm (see Chilton below), in Laclau/Mouffe's conception of discourse, the social is a realm of undecidability, which is never fully closed. This is why discourses always compete for defining the "empty spaces of meaning" through "decidable hegemonic articulations" (Torfing, 1999, p. 103). So in both concepts, discursive (and other) forms of competition over meaning-making are perceived as being at the heart of most conflicts for political and discursive hegemony.[14]

Since "an individual, a company or a whole society can positively react only to those laws and ethical rules, steering principles, motivational impulses and educational schemes which are consistent with their actual level of existence" (Beck & Cowan, 1996/2007, p. 31), this also helps to explain why and how certain discourses become hegemonic in a given context by defining the "dominant horizon of social orientation and action" (Torfing, 1999, p. 101) while others, however rational, intelligent, reasonable, or progressive they might appear from the outside, fail in that particular social or cultural context.[15] One of the most interesting questions therefore is: How are consciousness development and discursive change motivated and triggered and how do they occur?

The Role of Crisis of Sense-Making as Trigger of Change

Further strong and important parallels and compatibilities between human development and discourse theories, especially in the tradition of Laclau and Mouffe, concern their analysis of successful, that is, transformative or integrative development and of regressions, even though discourse theory, for the most part, does not theorize this distinction. Developmental theorists—at least the normative approaches presented here—agree that every individual starts his or her developmental journey at "level one"[16] and can then either move on upwards step by step to more complex, more differentiated levels, or stay where they are. The unfolding of new stages in line with their respective frames and systems of meaning and reasoning normally happens as a slow and steady process of learning, due to changed impulses, experiences and context factors. In an ideal scenario, the capacities of cognition, perception, reasoning, and problem solving grow with the complexity of problems, challenges, and circumstances, provided appropriate embedding cultures are in place. Successful development can then be perceived as a dynamic, spiral-like broadening of horizons, encouraged by individual experiences and social impulses.

---

[14] In contrast, for example, to Huntington's thesis of whole cultures competing with one another, it stresses the coexistence of various levels of existence, thought and action within each culture.

[15] Considered that collectivities can change the dominant mode or level of their discourse quite easily if their social and cultural composition – or that of their leadership – changes, it becomes clear that discourses, even though they have a certain dynamic of their own, are not fully independent of the consciousness of their bearers.

[16] In Piaget's terms: sensorimotor, in Kegan: first order consciousness, with Cook-Greuter: pre-social/symbiotic etc.

As argued earlier by Chilton, the process of development is similar on the social and cultural levels, at least when cultures first acquire a particular level. In less ideal cases, however, things might as well go wrong, especially at the borderlines (turning points) to each next higher level. If, for some reason, aspects of the previous level are not fully integrated into the next more complex level, the person might develop pathologies at that particular turning point. Here again, theorists of political development have come up with similar scenarios on the collective, cultural level. If social development happens through internal or external crisis or shocks, instead of steady evolution, the society in question might not be able to integrate the extent of new complexity through regular differentiation. In this case, it is likely to follow the opposed scenario of decreasing complexity by stepping back to less complex, but in turn more familiar and thus psychologically more secure levels of subsistence in search for easy answers and emotional reassurance. Such regressions therefore often include the identification of scapegoats and the rejection of responsibility.

Similar to developmental psychology, Laclau and Mouffe (2000) hold crisis of sense-making (dislocations) to be the central triggers of social and discursive change, rendering necessary new (in developmental terms), more complex discourses in order to cognitively organize and symbolically frame the problems or events which the old dominant discourses were not able to integrate any more. An example would be the (partial) dislocation of the neo-liberal growth model in result of the oil crisis in the 1970s, followed by a more radical questioning of the limits of growth and a growing interest in ecological issues, or the discursive struggle leading to a delegitimization and eventual end to apartheid in South Africa. Laclau and Mouffe even consider dislocations to be inherent parts (or at least possibilities) of any discourse, since in an essentially contingent social realm, they argue, discursive identities are never fully closed (Laclau, 1990).

Thus, both cognitive frames and discourses are likely to change with the social circumstances, experiences, and challenges they are confronted with. However, compared to Laclau and Mouffe's rather formal theory of discursive change which does not systematically deal with the question of complexity, sophistication, and sustainability of discursive sense-making strategies, adult development theories put an additional focus on the *direction of change* on a vertical axis of complexity. This appears to be particularly relevant for analyzing the situation in contexts of transition like that in Russia. In sum, developmental psychology perspectives either go beyond or provide a theoretical grounding for what at least part of discourse analysis is already doing. They thus help to explain that the more complex the challenges, the more complex the cognitive frames, coping mechanisms, and sense-making-strategies have to be in order to internally cope with, to discursively frame and to externally solve the respective problems satisfactorily – and this means: sustainably.

If, in contrast, the (ideal) trajectory of differentiation and integration is not taken for some reason, both individuals and (their) discourses seek to solve their new problems either with the strategies currently available to them or by (often panic-stricken) resorting to previous, less complex and thus, less demanding strategies in order to avoid chaos, dis-integration, or loss of identity. My claim is that this is roughly what is happening in post-Soviet Russia.

Soviet and Post-Soviet Russia Viewed from an Integral, Developmental Perspective

From a perspective of adult development theory, politics and political discourse in Russia can be analyzed not only horizontally, that is, as different ideological positions competing for discursive and political hegemony, but also vertically, as different cognitive, self or value structures competing for cultural hegemony in a broader sense. In this respect, I agree with Jordan's strategy to assume various dimensions of consciousness as equally relevant basic units of analysis rather than limiting the analysis to one single model and/or method (Jordan, 2000, p. 29). In any of these dimensions and research trajectories, an integral analysis focussing on developmental dynamics would try to answer at least the following questions:

- Which developmental stage (of cognition, self, identity, reasoning or action) do particular utterances, arguments or practices operate on? Which of the typical structural logics and patterns frame discursive utterances and political positions?
- On which level of developmental complexity is the dominant mode of discourse and political action located? And what level is the respective collective ruled on?
- What do the interaction processes between discourses look like?
- What use is made of dislocations? Are they consciously used for upward developments or do they rather result in downward regressions? Do discourses rather tend to gain or to lose developmental complexity?

The following section is guided by these questions, making reference to the categories offered by the approaches introduced in the second part of this article. On this basis, I will discuss to what extent the three non-digested aspects of dislocation mentioned above (collapse of the Soviet state, ideology, and system of political power) are still influential with regard to the three central corresponding issues on the social and political agenda of post-Soviet Russia: international status, national identity, and political power/democratic rule. In any of these issues, the transformation of politics and political discourse can be conceived as a function of how and to what extent the experiences of Soviet times have been re-appropriated: in other words, integrated into individual and cultural sense-making. And in any of them, such re-appropriation has so far been very limited. Rather, I claim that self-protective logics of reasoning and action have come to function as a strategy to avoid a more differentiated confrontation with the after-effects of these dislocations and with the Soviet past in general, at least during the past ten years.

In view of explaining political development and change in post-Soviet Russia, a preliminary account of developmental dynamics in the Soviet Union is indispensable. Together with the character and consequences of post-Soviet transition, it can help to explain why Russian politics "took refuge" in a self-protective logic of sense-making. Making solid claims about empirical cognitive, cultural, self/identity and value structures and their dynamics in Soviet and post-Soviet politics and society would require a larger research project[17] which is why the following considerations should be regarded primarily as intuitive, integrally informed "educated guesses."

---

[17] Even though the levels identified by adult development research across cultures and time can be considered as solid and reliable analytical categories, their unfailing identification in a concrete data set requires a high amount of schooling and experience. For a critical discussion of models, metrics and measurement in developmental psychology research see Stein and Heikkinen (2009).

A Developmental Reading of Social and Cultural Dynamics in Soviet and Post-Soviet History and Society

The Soviet regime, even though it made appeal to modern, universalist values such as social and political justice, equality, and solidarity, and drew its legitimacy to a large extent from these values—which is why, by the way, it was admired as a moral ideal by an impressive number of western intellectuals—was organized quite hierarchically. Ideally speaking, it was an absolutistic regime ruled by truth and dogma (See Table 2). While striving to overcome traditional Russia's Orthodox culture, it replaced it with a new tradition, communist orthodoxy. So even though the Bolshevik leaders were promoting universalist values and huge modernization projects, the brutality with which they cracked down on opponents to their new and often-changing orthodoxy clearly indicates that they were not operating on the basis of world-centric values themselves (see Table 4), but as an ideological dictatorship, or, in the case of Stalinism, simply a dictatorship of pure personal power. In the categories of Chilton, it would thus have to be located roughly between levels 2 and 4.

In fact, the question if or to what extent the Soviet regime can be explained as a specific example of modernity and/or modernization has been an object of ongoing debate among scholars of Soviet history.[18] On the one hand, the "modernist group" (Stephen Kotkin and others) holds that the Bolshevik project was a typical outcome of modernist thought and the Soviet experience thus an alternative, independent type of modernity.[19] On the other hand, the "neo-traditionalist group" around Sheila Fitzpatrick

> does not deny that the Soviet Union in its way was modern, but [rather stresses] the "archaizing" phenomena that were also a part of Stalinism: petitioning, patron-client networks, the ubiquity of other kinds of personal ties like *blat*, ascribed status categories, "court" politics in the Kremlin, the mystification of power and its projection through display, and so on. (Fox, 2006, pp. 535-536)

Similarly, Jörg Baberowski in his brilliant inaugural lecture explains the origins and character of violence in Stalinism by the Georgian clan culture which, as it were, was the embedding culture within which Stalin was socialized, and which in the Gebser/Graves/Habermas-scale (see Table 4, on p. 114 as Appendix) would comply with the archaic or magic levels.

So in this regard, the Bolshevik modernization project, even though it did change in character during the second half of Soviet history, clearly remained a selective one in that it did not allow for "enlightened criticism" and basic freedoms in the realm of political culture and consciousness. Stefan Plaggenborg (2006) in his recent study on Soviet modernity has traced back this important choice in early Bolshevik history to the controversy between Lenin and

---

[18] See, for example Fox (2006), Hoffmann and Kotsonis (2000) and the conference "Geheimnis und Gewalt. Zur Ambivalenz der stalinistischen Moderne" in Freiburg (FRIAS), 30./31.1.2009.

[19] According to Fox (2006, p. 36), Shmuel N. Eisenstadt's concept of multiple modernities "has not yet been explicitly ebraced by proponents of Russian/Soviet modernity" though.

Bogdanov.[20] He sees this conflict as an indicator of the “status of modernity of Lenin’s thinking, mental habitus,” and his categories of argumentation, even though he does not explicitly use categories of hierarchical complexity to support this (Plaggenborg, 2006, pp. 49-51). In result of Lenin’s radical position gaining hegemony, the Soviet leadership fought any thinking that was more complex or more critical than what their own orthodoxy allowed, just as it fought the traditional Orthodox culture itself, instead of overcoming traditional value structures through integrating them into more differentiated ones.

Later, when the CPSU’s monopoly of truth began to gradually lose its legitimacy in the 1970s and 80s, this was due, on the one hand, to the regime’s inability to meet its own claims vis-à-vis its population. Instead of social and political justice, the country had experienced extended periods of arbitrary terror and repressions, instead of equality and solidarity, a deep social cleavage between the political elite and ordinary citizens, and relative backwardness in many fields instead of the promised high standard of living. At the same time, the cultural and political models of modern western civilizations which then had already begun to transcend modernity with post-modern values and cultural practices (Inglehart, 1977, 2003; Ray & Anderson, 2000) were increasingly perceived as economically and politically superior and therefore as attractive alternatives. Yet, from a developmental perspective, the crucial problem is that modern (i.e., individualistic, rational, multiplistic) and postmodern (i.e., reflexive, relativistic, pluralist, and post-materialistic) value structures cannot be adopted like an ideology, but have to develop in a process of transcending and integrating all previous, less complex levels of thinking, existence, and motivation. As integral perspectives stress, “in order for higher levels of civilization to be maintained, the enduring contributions of the earlier stages must be in place and functioning” (McIntosh, 2007, p. 47).[21] In Russia, however, with traditional Orthodox culture largely destroyed and communist orthodoxy experienced as a forced, illegitimate, and (at least in some respects) less complex substitute, there was hardly any basis left from which a more integrative and thus more sustainable modern value-structure could emerge on a broader social basis. If to infer from the scarce data on Soviet consciousness, culture, and society, the average attitude towards politics in the Soviet Union was most probably either conformist or self-protective (in Cook-Greuter’s terms), and thus below a “conscientious” traditionalism, whereas Cook-Greuter’s “individualistic,” “autonomous,” or higher levels of development were presumably very rare in the average population. This, in any case, might be one reason why liberal reformers had a difficult time after 1991.

For the first few years of the Yeltsin era, there was indeed a certain consensus with regard to “modern” or even postmodern values like peaceful conflict resolution, banning state ideologies, and promoting individual rights and freedoms, which is why there was hope that Russia might take the path of liberal and democratic transformation. However, these values did not seem to be rooted firmly enough to prevent strong contrarious, lower level mental habits and continuities from regaining power over the formal liberal and democratic institutions introduced by the first Russian president (see my example presented in the first part of this article). Without a sufficiently broad basis of higher level, for example conscientious or individualist consciousness supporting them, it is no surprise that at least part of Russia's social and political institutions were eventually re-adapted to the (less complex) centre of gravity of public consciousness and political discourse. Concerning present-day Russia, social scientists and politicians therefore almost in unison speak of a return to previous modes and habits of rule (Mommsen, 2006; Shevtsova, 2003), even though many of them continue to have difficulties categorizing them conceptually.[22]

---

[20] Aleksandr Bogdanov was a thoughtful and, in today’s terms post-modern or even integral philosopher interested in the conditions and dynamics of human knowledge and awareness. He rejected the possibility of objective and timeless truth and pleaded in favour of transcending the dualism of spirit and matter through what he called an “empiriomonizm”, i.e., socially organized complexes of experience. See Plaggenborg (2006, chapter 2) and Plaggenborg and Soboleva (2008).

[21] Also: “Countries, governments, and cultures must move through each of the stages of development sequentially. Each stage must be achieved, and failure to recognize this may be a major contributing factor to the rise of terrorism and crime in a society” (Commons & Goodheart, 2007, p. 91).

If we take the late Soviet Union to have been a weak stage 4 absolutistic regime (with all the limits of this diagnosis, due to pressure from above, eroding legitimacy etc.), a developmental perspective would probably find elements of regression in post-Soviet politics. An alternative interpretation would be to assume simply a realignment of consciousness, habitual political practices and institutions on the next lower, more familiar and thus more secure level. What makes such an analysis tricky however, is that important elements of modernity and post-modernity are indeed part of everyday life in today's Russia have even been radicalized (for example in the form of the Manchester capitalism of the 1990s or the cosmopolitan lifestyles of large parts of Russia's upper class). In this respect, I would claim that a developmental perspective could highlight that notwithstanding both persistent efforts to modernize the country in order to prepare it for the challenges of a globalized world and a social elite that has caught up with and even overtaken the average western citizen in a material sense, modern and postmodern values and logics have neither become the dominant structures of public reasoning nor of political action on a larger scale. Sustainable post-conventional action logics, for example, would also include post-materialist and other post-conventional values, such as critical self-reflection, putting higher weight on good relationships and inner growth as compared to material goods, increasing feelings of empathy, tolerance, and respect for other cultures, social and political minorities and even the rights and dignity of political opponents (see Table 4). The basically materialistic, hedonistic lifestyle of a privileged elite lacking a visible notion of civic virtues, common welfare, and social and political justice can at best be classified as a rather selective and superficial, and therefore non-sustainable, "unhealthy" modernism, if not simply egocentric opportunism. Moreover, their dealing of rights and liberties against stability and prosperity may rather be explained by self-protective logics which seem to be the driving mechanism behind many social and political dynamics in Putinist (and Medvedevian) Russia.[23] Before illustrating this in more detail, let us take a closer look at Cook-Greuter's stage description.

The Self-Protective Action Logic by Cook-Greuter

Susanne Cook-Greuter (2007, pp. 9-11) describes the self-protective stage as follows.

---

[22] Margarethe Wiest reviews the debate about if Russia should be called an authoritarian regime, see: http://www.eurozine.com/articles/2006-09-08-wiest-de.html.

[23] This is not to say that more complex action logics are completely absent. In contrast, Russia's old human rights movement, for example, as well as its constantly being ignored by the government, shows an important subcultural decalage.

Self-protective people see the world only from the perspective of their own needs and wants. They are as yet incapable of insight into themselves or others in a psychological sense. This is why they are generally wary of others' intentions and assume the worst. Everything to them is a war of wills, and life a zero-sum game. Their 'I win, you lose' mentality inevitably causes friction and hurt feelings wherever they go, especially with others at more conventional stages. In turn, others experience self-protective people often as manipulative and exploitative, because in their perspective, the only way one can get what one wants is by controlling others and protecting oneself.

Self-protective adults are careful to maintain their essentially fragile selves which are not yet 'separate adult selves,' but synonymous with one's will, ideas, wishes. Therefore, this stage also has only a rudimentary notion of others as separate people or of conscious social interaction. 'If I understand what others are after, I can better manipulate them to get what I want,' so they think. Conversely, they assume that if others knew what you wanted, they would have power over you. Consequently, they need to resist the will of others, to test their limits and to assert their own control. Moreover, self-respect is experienced in relation to the amount of control one can achieve in opposition to others. The self may be felt as having two sides, an inner real self, and an outer self or 'a false face' in order to protect oneself.

Self-protective individuals often think they are the odd person out. They feel isolated, but do not know how to relate to others differently. 'It's always me against the rest.' This creates a self-perpetuating dynamic of very low trust and hyper-vigilance. This is why persons at this level often '*get into trouble.*' Trouble happens inadvertently when you cross a boundary. Self-protective folks try to look out for trouble and then to avoid its consequences. Rather, when they lose a test of will, or overstep a boundary, they see the cause as outside themselves, getting frustrated and tending to show free-flowing anger and hostility. Others are to blame, never oneself.

Self-protective people do not understand subtle human interactions that are not based on power. Their relationships with others are volatile. Friendships blow up easily. Feelings are externalized and projected outward. We see little expression or reflection on their own emotions both because of a lack of insight as well as for self-protection. Showing weakness of any kind is dangerous. "The more others know about me, the more they can take advantage of me." Their own anger towards the world is projected outward, and others are experienced as angry all the time. For self-protective persons, the world therefore is a hostile, dangerous place where cleverness and grabbing opportunities are necessary for survival. Hence, self-protective people also have an expedient morality. Rules are recognized, but only followed for immediate advantage or to avoid punishment. Actions are only bad, if one is caught and punished. When caught, they are shameless and show little remorse. They do not feel responsible for failure or trouble they cause because they do not yet understand the connection between action and consequences, that is, linear causality. Blaming others for one's shortcomings is a way to protect oneself. Self-protective people are also called opportunistic because of their self-serving attitude as well

> as for their nose for opportunities and their energy to go after what they want without reflection or delay. (Cook-Greuter, 2007, pp. 9-11) [24]

The political impacts and functioning of this action logic shall now be illustrated with respect to the three fields of dislocation mentioned above.

The Foreign Politics of Strength and International Status

While the Yeltsin era had been largely characterized by a lack—or loss—of cultural identity, due to the numerous forced political and symbolic compromises with the old elites mentioned earlier and to unconvincing attempts to restore the country's internal stability and position in world politics, international status has been a major field of activity—and of success—of President Putin as compared to his predecessor. With the loss of the Soviet empire continuing to be a deep wound within post-Soviet political consciousness, the re-strengthening of Russia's status as a great power and global player has been one of the most important foundations of Putin's popularity in the Russian public.[25] It is perceived as giving Russians back the national pride and respect they deserve and had been lacking so bitterly throughout the 1990s. This restoration of Russia's power and status was based, first, on the country's largely successful economic development during the past years, and second, on a foreign policy discourse increasingly returning to a power-based geo- and "realpolitik," that is, a thinking in spheres of geopolitical, economic, and cultural influence, necessarily competing with the spheres of influence of others.[26]

While the European Union's agreements with former Soviet republics, for example, are perceived as attempts to enlarge Europe's influence, and therefore constructed as a threat to Russia's position and interests, Russia's foreign policy actively tries to maintain and enlarge its own sphere of influence, particularly in the former republics of the Soviet Union. This so-called "near abroad" is considered as a zone of "privileged interest" where Russia claims a legitimate right to exercise power and control.[27] While those of the neighbouring former Soviet republics which have meanwhile become members of the European Union therefore view Russian foreign politics with great suspicion, urging for more "proportional answers" by the EU,[28] some of those who have simply become independent states have even come to experience hot conflicts with the "New Russia" due to this self-image.

---

[24] Quotes drawn and compiled from Cook-Greuter (2007, pp. 9-11).

[25] See for example the survey data published regularly in the online-digest „Russland-Analysen“ by the Forschungsstelle Osteuropa (Bremen; URL: http://www.forschungsstelle.uni-bremen.de). It remains to be seen to what extent the government's poor performance during the current financial crisis downgrades this rating.

[26] Svedish foreign minister Carl Bildt recently called this „old concepts of power, domination and spheres of influence“, with power and influence conceived as the power to impose one's will and/or ideas onto others. „Wir brauchen eine Ost-Partnerschaft“, interview with Carl Bildt in: F.A.Z., 1.9.2008. Even more concisely, Condoleezza Rice speaks of a „19th century Russia“ exercising pressure onto free nations. „Transatlantische Einigkeit gegenüber Russland“, in: F.A.Z., 24.9.2008.

[27] See Ruprecht Polenz: Von Russland annektiert, F.A.Z., 2.10.2008.

28 See „Sikorski droht Russland. Für ‚proportionale Antwort' auf nächste Grenzverletzung“, F.A.Z., 21.11.2008.

Viewed from a developmental perspective, Russia's foreign politics under Putin and Medvedev, as compared to Soviet foreign politics, have changed mainly in that they are not ideological any more, for example in their definition of enemies and adversaries. However, the question arises, in which direction their logic of political action has moved on a vertical scale.

Martin Müller has recently published a discourse analytical account of Russian foreign policy discourse as observed at MGIMO, Moscow's elite State Institute of International Relations. Using Laclau/Mouffe's methodology, Müller finds that to be a "respected and influential, independent actor in world politics (with) a prospering economy, and (playing) a leading role in the post-Soviet states" is the main driving force of Russia's geopolitical identity – or quest for identity. For he argues that the quest for national grandeur is caused by a "constitutive lack (or blockage) of identity" caused by fear of a potential weak Russia (Müller, 2009, p. 218).

Since in this attempt to strengthen Russia's own position of power and control[29] dramatic gestures, alleged threats, conspiracy theories, images of the enemy, and even the use of illegitimate violence continue to be important means, as if in compensation for the geopolitical power lost with the Soviet empire, I argue that the logic behind this reasoning and behaviour is a self-protective, compensatory one.

This also becomes visible in a certain tendency to make others responsible for problems and conflicts while escaping debates about Russia's own shortcomings and mistakes (for example in the Georgian conflict or, until most recently, with regard to Katyn). So indeed, Russia's foreign politics seems to perceive and construct the world solely through the lens of Russian needs and wishes[30] instead of taking more complex perspectives, accepting own weaknesses or showing empathy. Moreover, a less self-defensive attitude towards the countries of Russia's "near abroad" would imply a more self-critical attitude, the preparation to admit past mistakes and trespasses and to eventually come to terms with them, in other words to critically re-appropriate and emotionally integrate the collapse of the Soviet Union and its imperial relation towards neighbouring states. According to Cook-Greuter however, due to hurt feelings of security or to unconfronted angst and trauma, the self-protective identity is usually too weak to allow a similar, more differentiated behaviour. Consequently, these issues would necessarily have to be addressed in order to allow for upward development.

Domestic Politics and Political Rule

In domestic politics, President Yeltsin's rule was equally characterized by a rather weak performance. His inability to implement a large part of his own reform agenda was due both to multiple arrangements with the opposition and to his personal instability and increasing alcoholism. In this respect, Putin also set powerful contrary landmarks, beginning with his image of a strong, healthy, and sexy sportsman. During his years in office as president and now prime minister, a largely power-based logic of behaviour and political interaction has equally been implemented vis-à-vis internal critics and competitors who tend to be perceived as inherently hostile and to be made responsible for all kinds of problems. Since 2000, the domestic regime has increasingly taken the shape of an authoritarian and personalized rule of power again. Born of self-protective opportunism, it consequently regards liberal and democratic rights and practices—the meaning of which it does not seem to understand—as unnecessary and even dangerous to its own survival. Within a self-protective world perception, and reasoning, the gradual cutting back or even complete abolishment of many of the (allowedly badly functioning) liberal institutions introduced under Yeltsin, in order to stabilize the (Putinist) state and the power of its leaders, for example by restricting public criticism of the government or by curtailing the chances for political opposition, appears as a logical strategy.

---

[29] See Michael Ludwig: „Ablehnung einkalkuliert. Das Konzept einer ‚neuen Sicherheitsarchitektur' des russischen Präsidenten", in: F.A.Z., 6.11.2008 and: „Moskau will sich nicht ‚umzingeln' lassen", in: F.A.Z., 7.11.2008.

[30] See for example Reinhard Veser: „Positiver Geist bei Georgien-Gesprächen", F.A.Z., 19.12.2008.

To what extent was the Soviet experience re-appropriated in this field? While Yeltsin's efforts to build up a democratic Russia were driven, at least in the beginning, by his explicit wish to overcome and transcend Soviet political legacies of centralist power by more sophisticated, more liberal, and more complex modes of rule (the success of which truly is another story) the current connotations of the term "democracy" (such as "sovereign democracy" and "vertical of power") rather point in the opposite direction on the developmental scale (Mommsen, 2006; Schulze, 2007). Putin himself has not only started his first presidential term with calling the collapse of the Soviet Union "the greatest tragedy of the 20th century."[31] He has also repeatedly voiced that extensive liberal rights were a luxury Russia could not afford.[32]

In fact, threats to social and political stability indeed constitute a social bugaboo after the experience of the chronic instability of the Yeltsin era. This is a reason why Putin's strategy of stabilizing the status quo is not only supported by a majority of the population and elites (see Rjabov, 2004), but also thought necessary by some external observers. To them, the fact that there is a more or less stable political order apparently is more important than the fact that this order is not based on a social consensus about how to define democratic government.

However, dealing rights and freedoms against (the promise of) stability and prosperity is a clear indicator of either self-protective or conformist logics dominating political and social dynamics. So, here again, what we observe (subject to more thorough study) seems to be either inertia or regression, to some extent reiterating Soviet logics and legacies (bread and stability versus politically "good conduct"), rather than a vertical transformation based on a critical re-appropriation of past habits of political rule and social interaction.

National Identity and Self-Image

Finally, the quest for national identity touches the heart of the problem of dislocation and national trauma. Since in former times, Russian identity had either been closely linked with the Soviet project or, before that, based on Orthodox culture plus Russia's status of an imperial power, the end of the Soviet Union has often been made responsible for Russia's complete loss of identity (de Keghel, 2006). Despite multiple efforts undertaken by the government, no clear positive vision of a new national identity emerged during most of the Yeltsin era. The (however selective) reconstruction of certain elements of pre-Soviet history (eventually compatible with a more modern path of development) can also be regarded as an indication of Russia's search for "good traditions" which could compensate for the loss of a "mature" traditional consciousness (McIntosh, 2007) and allow for constructing positive continuities.

---

[31] See, for example, http://www.owep.de/2006_1_wehner.php.

[32] For example reported in: Robert G. Darst, Jane I. Dawson: Global denken, lokal endlagern? Russland und das Problem des Atommülls, in: Osteuropa 4 (2006):221-234, here: 231.

In the field of symbolic politics, Putin, in turn, has tried to establish a "Soviet-post-Soviet mixed identity," combining, for example, the tsarist flag with the music of the Soviet national anthem which was given a new, more neutral patriotic wording (de Keghel, 2006, 2008). The eclectic mixture of Soviet, pre-, and post-Soviet symbols is apparently welcomed by a majority of the population, but persistently rejected by the tiny group of liberal democrats and former dissidents who are being increasingly marginalized by the regime. Anyhow, Putin's Soviet-post-Soviet mixed identity is itself rather a self-protective than an integrative, transformative project, since it is not based on an open confrontation with Soviet history and some form of public political coming to terms with the past. On the contrary, Putin's eclecticist identity politics apparently serve as a strategy to protect the collective self from the challenge of losing face in a more thorough, more differentiated and thus more demanding process of a self-critical national re-appropriation of the past. It is therefore not surprising that national identity has been an ongoing, ever-present issue of debate since the collapse of the Soviet Union. With Soviet ideology dislocated but many of the cognitive and political logics of Soviet times "alive and kicking" (above all conformism and self-protection), how could a new, post-Soviet identity possibly develop, and what could it look like?

In the last resort, no substantial new identity (going beyond the rather airy images of power and national strength) is likely to emerge unless a number of uncomfortable questions and memories are addressed, and re-appropriated by society as a whole in a transformative way: that is, through facing the multi-dimensional political, structural, cultural, and emotional legacies of Soviet rule. This probably would have to include first and foremost questions of guilt and responsibility towards Russia's own citizens and neighbouring states (see Schwan, 1997), as well as of (at least symbolic) compensation of the traumas suffered by millions of Russian and other victims of the Soviet regime. Given the huge dimension of this task,[33] the present tendencies to dissociate and repress "that which prevents the closure of one's identity" (in Laclau & Mouffe's terms) through what could be called a regression of the average mode of discourse to a strikingly low level is well understandable. However, as we saw earlier, "societies cannot go back and pretend that changes have not taken place" (Chilton 1988a, p. 95). Breaking out of the self-chosen prison of regression would therefore require an integrative transformation, transcending the currently dominant self-protective, self-defensive logics by wider horizons and deeper (self-) understanding – and, to achieve this, more political courage and the right kind of support.

According to Cook-Greuter, the appropriate way to support self-protective individuals would be to give them respect and, at the same time, to set clear boundaries (including immediate sanctions for trespassing). This would encourage them to let go of their fear for their self-identity and to move forward to observe general rules – the main challenge of the next higher stage in her model. For those concerned, this would mean to connect their self-image and identity no longer to winning power games and playing ego theatre, but to being a “good member of…” the international community, for example. Moreover, applied uses of adult development theory not only provide strategies to encourage and assist upward development. Adult development theory might also allow insights into why western politics continue to have difficulties with implementing a similar strategy towards Russia. To discuss these political implications in more depth, however, goes beyond both the pretensions and the limits of this article.[34]

---

[33] Remember Markus Wehner's comment, the Soviet past was „too horrible and too close“ to be dealt with in the „German way“ (footnote 2).

Conclusion and Future Prospects: An Integral Theory about Where Russia Is, and Why

In this article, I have discussed current cultural and political developments in post-Soviet Russia from an angle of several adult developmental theory perspectives. Starting with the observation that even though democratic institutions are in place, they seem to function according to non-democratic logics, I have made several arguments. I claim that Russian politics are still to a large extent determined by the effects of a crisis of sense-making connected to the collapse of the Soviet empire, the question of how to define democratic government, and the lack of a resilient national identity. Neither of these dislocations has so far been resolved and re-appropriated in a transformative manner. To substantiate this argument, I have presented categories and analytical frameworks from various models of adult development, describing general characteristics of consciousness development, particular stage characteristics, and general dynamics and logics of successful and unsuccessful cultural and political development. Of these sources, the developmental logic as described by Stephen Chilton and the self-protective action logic conceived by Susanne Cook-Greuter are particularly relevant to the analysis of Russian politics. I have then also raised some methodological questions which a more systematic empirical study would have to consider. I discussed possible connections of developmental approaches with discourse theory and analysis, a research perspective which is increasingly used in Russian studies. In the last section, I have given a brief account of developmental dynamics in the Soviet Union, followed by a more detailed outline of how self-protective logics are at work and functioning in various areas of Russian politics.

In a nutshell, I suggest that the “regression” of the dominant action logic of Russian politics to a self-protective level is, on the one hand, a reaction to Russia’s failure to reach and materialize a mature and “healthy” traditionalism (Chilton’s stage 4) in the Soviet Union (which wanted to achieve socialist modernity not by transcending but by destroying pre-Soviet traditions). On the other hand, self-protection is also a strategy of the current regime to avoid critical self-reflection, putting into question dear habits and privileges, and taking over responsibility for past mistakes and crimes committed in the name of the Soviet regime. Unfortunately, this also means avoiding a more thorough, that is, more than just technological, and a more integrative cultural and political transformation. Now, if this diagnosis ultimately is to be explained as a regression or as a realignment of politics and the underlying patterns of consciousness development depends on how we assess the situation in the Soviet Union. If we regard the latter as a (“reduced”) stage 4 culture, it would be a regression, if we regard it as a stage 2/3 culture with a stage 4 façade, we would have a mere realignment of inner and outer phenomena.

---

[34] For more ideas on this, see Commons & Goodheart (2007), Ross & Commons (2008), and Müller (2009).

While the regime currently in place seems to enjoy the support of large sections of the population, preferring stability and prosperity to liberty and democracy, the question still arises what all those interested in Russia eventually moving upward on the scale of development could do to encourage and support this. Besides accepting where Russia stands in a developmental perspective and why, the most promising strategy for external partners would be to give Russia much honest respect where it deserves it, and to clearly point out limits of tolerance where it threatens to trespass them. The fact that most western actors, for the time being, fall short of consequently implementing this simple strategy probably has to do with their own developmental trajectories.

The Superbubble behind "The Great Moderation:" How the Brandt Report Foresaw Today's Global Economic Crisis

James Bernard Quilligan[1]

Abstract: The Brandt Commission Report, published in 1980, broke ground in vital areas. It was the first international body to develop such concepts as *interdependence, globalization, sustainable development,* and *alternative sources of development financing.* It grappled with the difficult problem of global monetary imbalances, not in a vacuum, but rather, situated in the Commission's stance that reforms in poverty, aid, debt, armaments expenditures, environment, technology, trade, and finance will not effectively meet their goals until they are supported by a totally-restructured monetary system. Virtually all sustainable development initiatives since then have missed that need for restructuring.

The Brandt Report warrants this first treatment of a full political economic framing because the world continues to operate with those structural imbalances and faces a global economic crisis. Nations with current account deficits are required by the rules of the marketplace and international institutions to adjust their fiscal balances by paying off their loans. Yet nations with current account surpluses are not under similar obligation because there is no adjustment mechanism for recycling their trade surpluses and currency reserves. Compelling examples of this disequilibrium today are the current account imbalances between the surplus nations of China and other Asian states on the one hand, and deficit nations like the United States and United Kingdom on the other. A mitigating factor is the use of the dollar as the world's reserve currency, which allows the US to avoid adjusting its deficits on a timely basis. A major global financial adjustment is needed to eliminate the financial and monetary superbubble that has been forming as a result of these deep contradictions in the international system. The Brandt Report anticipated that unless these global imbalances were corrected through coordinated international action, there would be a series of sovereign debt crises, resulting in an emergency monetary readjustment. Brandt also demonstrated that any international stimulus program to merge the development needs of the global South, the underused capacity of the global North, and the needs of the entire world for a low-carbon environment, must be directly linked to the restructuring of the international monetary regime, including a new global currency and reserve system.

A return to the principles and analyses spelled out in the Brandt Report is needed now to reform the global economic infrastructure. Brandt's call for an international monetary conference to address these issues is even more pressing and salient today than it was 30 years ago.

---

Keywords: Balance of payments adjustment, Brandt Commission, current account imbalances, dollar crisis, exchange rates, global Keynesianism, global monetary conference, global monetary system, Great Moderation, new Bretton Woods system, reserve system, superbubble, sustainable development, Willy Brandt.

Introduction[2]

I intend for this article to contribute in two ways to this special issue's theme, "toward development of politics and the political." On this 30th anniversary of the Brandt Commission's seminal report, I have attempted to give its systemic insights the full political economic framing they have not been given before. In so doing, I aim to elevate the *import* of Brandt's contribution to the level often attributed to John Maynard Keynes' original—but rejected—proposals at the 1944 Bretton Woods conference for a reciprocal international economic adjustment process. I show how the Brandt Commission's arguments for a new global monetary system have not only stood the test of time, but also how its predictions have been validated by national and international events in the ensuing decades. For the same reasons stressed in the Brandt Report, my selected focus is on international monetary policy and its relation to the current global economic crisis.

In particular, I establish how Brandt foresaw the structural existence and global implications of a burgeoning *superbubble*—recently given this name by George Soros—which continues to generate ever-larger global economic imbalances. I contend that during the 1982-2007 period of economic growth with low inflation—which Ben Bernanke has called "The Great Moderation"—Western society was lulled into a kind of complacency by free market ideology that obscured this underlying global disequilibrium. Eliminating the superbubble inherent in the global financial and monetary system starts with recognizing its origins, relationships, and impacts. My discussion traces these themes and weaves them and other meta relationships together through the lens of the Brandt Report.

Such recognitions relate to the second contribution of this article. The Brandt Commission's systemic analyses and recommendations are as central to restructuring "the political" in economic and monetary policy terms as they are to integrating sustainable development into the global economic system. That integration will be essential in reconfiguring the politics of sustainability, climate change, economic growth, and global wealth disparity to meet the immense challenges of world society in the decades ahead. Thus, in Brandt we have a compendium of received wisdom long ignored yet still vital. I suggest that a return to the principles and analyses spelled out in the report is needed now to address the contradictions which are deeply embedded in the global economic infrastructure. As Brandt demonstrated, efforts to reform economic development will fail if they do not begin at the foundational level of the international monetary system. The structural flaws inherent in the Bretton Woods scheme since the 1940s have introduced incessant dysfunctions into the global political economy, which are reproduced at national and local levels. I show that this complex of interrelationships can be transformed only by addressing the assumptions, principles, and mechanisms behind the current operating system.

---

[2] *Editor's note:* In formatting this article, we employed a hybrid of the journal's traditional use of APA style and the author's style to accommodate the nature of the material. We used footnoted citations and did not use block quotes.

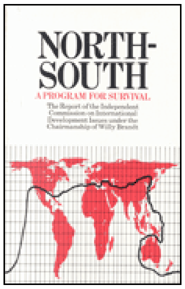
To provide a comprehensive overview of the problem of global economic imbalances and to establish linkages among its various elements, this article is organized into four major parts. The first part provides a general introduction to the Brandt Commission Report, including some of its tangible impacts to date and perennial challenges that remain unaddressed. The remainder follows a chronological trajectory. The second part summarizes the history of international development since 1944, along with critiques of structural inadequacies and explanations of the major monetary and financial influences on the praxis of international development. This includes the shortcomings of modern economic theories and the failure of central banks, policymakers, and analysts to generate realistic proposals that address the structural errors in the Bretton Woods institutions—and how the mandates of these decision makers keep the international monetary system in a state of perpetual disequilibrium. The work of the Brandt Commission and its monetary proposals are set in this historical context.

The third part focuses on present world conditions in three main areas: the exchange rate regime, balance of payments adjustments, and the reserve system. These monetary components, which are at the heart of today's global economic crisis, are integrated with the Brandt Report's analytical perspective, policy suggestions, and predictions. The final part takes a look ahead, with emphasis on the aforementioned superbubble, the US dollar crisis, and the vulnerability of the dollar's status as a global reserve currency. It closes by iterating the Brandt Commission's call for an international monetary conference and identifies key questions surrounding this world-changing event.

The article integrates historical conditions and the Brandt insights with the present crisis in the international economy and shows how they are all of one piece. It indicates why the challenges that Brandt tackled three decades ago remain the same challenges we face today, particularly if we are to create a new global economic system and avoid a systemic collapse and long period of global stagnation and depression. I've tried to show that these economic circumstances are also deeply political, since international discussions for restructuring the global economic system will require significant changes in the global political balance of power. Taken as a whole, the article is an argument for facing into and developing our political capacities at all scales to deploy recommendations like those that the Brandt Commission Report supplied thirty years ago. I also emphasize that these structural changes become only more painful the longer we postpone them.

The Brandt Commission Report

International policy on economic development reached a new threshold three decades ago. Willy Brandt, the former West German Chancellor, began planning an Independent Commission on International Development Issues in January 1977. Humankind, Brandt observed, "already faces basic problems which cannot be solved purely at the national or even regional levels, such as security and peace, development goals, the monetary system, protection of the



NORTH-
SOUTH
A PROGRAM FOR SURVIVAL

environment, energy, and the control of space and ocean resources. The international community has begun to tackle these problems but, to date, very inadequately."[3]

Brandt's panel—comprised of twenty-two international political and economic leaders—deliberated on these global issues for the next three years. In January 1980, they issued a report, *North-South: A Program for Survival*. Its comprehensive strategy for restructuring the global economy, including an emergency program to end poverty in developing nations, was hailed by many international agencies, governments, business leaders and civil society groups across the world. The Brandt Report quickly became the best-selling book on international development in history.[4]

Many of the facts and statistics in the Brandt Report are outdated and of little interest now. Global markets have also grown much more sophisticated since the time of its publication. Yet the broad problems of the global economy have changed little in the intervening years and the strategic objectives and principles which were formulated by Brandt's commission are still highly relevant. The Brandt Report pinpointed "not merely one, but several crises: the crisis of relentless inflation and increasing energy costs, the crisis of dwindling energy availability, the crisis resulting from mounting financial requirements, and the crisis posed by constraints on world trade and on the growth of export earnings to meet increased debt service commitments. Taken together, they threaten the whole structure of our political, industrial and financial institutions, unless we move urgently and adequately to deal with the basic causes" ... "to ensure a sustainable biological environment, and sustainable prosperity based on equitably shared resources."[5]

Willy Brandt and the author at a press conference in 1980

As a publicist and adviser to the Brandt Commission during that period, I traveled across the world, consulting with many heads of state, legislators, business leaders, and civil society and media representatives. In 2000, some associates and I created a website aimed at updating the Brandt Report for the opening years of the 21st century.[6] Looking back from the perspective of the Millennium, it was clear that all of the basic problems that the Brandt Commission had initially addressed—food, aid, environment, energy, trade, finance and monetary reform, as well as global negotiations to find solutions to these issues—were still unresolved and had become only more urgent with the passage of time. This is not to minimize the subsequent advances in many of the areas of international development that the Brandt Report had first proposed. Some of these later milestones include:

---

[3] Brandt Commission (1980, p. 267)

[4] Due to popular demand, an addendum to the report, *Common Crisis: North-South Cooperation for World Recovery*, was published in 1983.

[5] Brandt Commission (1980, p. 239, p. 124)

[6] Brandt 21 Forum (2000)

- Brundtland Commission (1987), which refined the concept of sustainable development;
- United Nations Conference on Environment and Development (1992), which launched a broad coalition of environmental and development groups;
- Commission on Global Governance (1995), which advanced the concept of a new multilateralism to support the objectives of sustainable development;
- Millennium Development Goals (2000), which set measurable, internationally affirmed objectives for sustainable development;
- Earth Charter (2000), which elaborated the principles and rights necessary for the transition to a global civilization based on sustainable development.

These initiatives and others have furthered our understanding and led to important policy reforms. Yet they have not been nearly enough. Many brilliant programs and projects have been launched, only to be compromised or co-opted by the commercial and strategic interests of businesses and nation-states. Rather than integrate sustainable development into the very structure of the system, policy makers and activists have sought to graft sustainable development onto the present economic system through public-private partnerships and capital incentives. Now that global pollution and climate change have escalated, and the gap between the global rich and poor continues to widen, it's become clear that sustainable development as it has been practiced will not create the transformation that is needed. Vital as they are, the various reforms of the past three decades have diverted attention away from the deeper systemic problems of the international economy.

The Brandt Report introduced the maxim that *reforms in poverty, aid, debt, armaments expenditures, environment, technology, trade, and finance will not effectively meet their goals until they are supported by a totally restructured monetary system*. This is the key point that virtually all of the sustainable development initiatives since the Brandt Report have missed. Simply put, sustainable development is a necessary condition for transforming world society—but not a sufficient condition. We cannot expect sustainable development to generate a new economy on its own: the price signals of the marketplace will not create sustainable development at the depth and scale that are needed. It will require new incentives emerging from purposeful institutional change to create a multilateral economic system with sustainable development at its core.

Now, on the thirtieth anniversary of its publication, I wish to underscore some of the major policy areas in which the Brandt Report still has something vital to say—proposals which have been largely forgotten but may yet have relevance to our present generation of politicians, economists, and global citizens. History would not be served if the significance of the Brandt Report were ignored, particularly since many of today's familiar trends and potential solutions had their origins in this book. It is not widely recognized, for example, that the Brandt Commission was the first international body to introduce the concepts of *interdependence, globalization, sustainable development,* and *alternative sources of development financing* in its report and supporting documents. Indeed, there are many dimensions of the Brandt Report that were ahead of their time—yet none as prescient as its proposals for *restructuring the international monetary system.*

The publication of the Brandt Report occurred at a crucial moment in the history of Western political economy. It was issued just after the political failure of Keynesian demand-side economics and just before the start of the Thatcher-Reagan supply-side era. Frankly, it must be said that in spite of its considerable international popularity, the Brandt Report had little impact on this turn of events.[7] Indeed, its demand-side proposals were the very opposite of the supply-side policies which were soon to become mainstream thinking. Nor did the Brandt Commission anticipate the lengthy period of asset appreciation with modest inflation from 1982-2007, which Ben Bernanke has called "The Great Moderation."[8]

While the Brandt Commission did not know how long it would take, it was convinced that a continued economic emphasis on national production—rather than the stimulation of global effective demand—would lead to major structural distortions, disequilibrium, and crisis in the global economy. Brandt and his colleagues clearly recognized that without fundamental restructuring, sooner or later the global economy would have to reckon with what financier George Soros has recently called a *superbubble*—the ever-enlarging monetary asymmetry that underlies individual financial bubbles, like the subprime mortgage bubble that burst in 2007.[9]

Anticipating that the structural flaws in the international monetary system would ultimately lead to irreconcilable global economic imbalances in aid, trade, finance, and monetary exchange, Brandt's team warned that "the problem of managing the international imbalances of payments is increasing the threat of grave crises in international finance. We have serious doubts as to whether the existing world machinery can cope with these imbalances and the management of world liquidity and debt."[10] If nothing were done to correct these imbalances, Brandt predicted, a protracted series of financial shocks would result in a major public debt crisis, engulfing all nations. Indeed, the world has experienced the severe fallout from a series of credit-driven recessions over the past forty years, although the expected global fiscal debt crisis is only now beginning.[11]

Unfortunately, few politicians, bankers, or commentators seem prepared to look deeply into the structural causes of these breakdowns. We have been unwilling to see *the origins and buildup of the superbubble in the series of modifications to the global economic structure that have*

---

[7] Translated into twenty different languages, the Brandt Report sold over a million copies around the world. But the political momentum behind supply-side economics was also very strong and the proposals of the Brandt Commission failed to capture the interest of Western policymakers.

[8] Bernanke (2004)

[9] Soros (2008).Soros contends that the superbubble started with the policies of financial deregulation and private investment in credit that were developed during the early Reagan-Thatcher era. My view is that the superbubble phenomenon was already well under way by that time. I suggest that the superbubble had its origins in the policies of monetary deregulation beginning in the early 1970s. The changes in economic policy that took place in the early 1980s merely gave political cover to—and greatly accelerated—the process of credit expansion and the development of asset bubbles which were unleashed when the US took the world off the gold standard in 1971. Many analysts have not explored the real implications of this connection: that the financial deregulation of the 1980s was the direct result of the monetary deregulation of the 1970s.

[10] Brandt Commission (1983, p. 2)

[11] The term "recession" is usually defined as a period in which there is a general decline in global GDP for two or more quarters.

occurred over the past four decades. This includes the deregulation of the monetary system (1970s), the financial system (1980s), the trade system (1990s), and the philanthropic/foreign aid system (2000s).

The monetary deregulation of 1971 (which launched this cascade of changes in international economic policy) was triggered by a foreign call on US gold but also had its roots in the rationalization that markets self-correct.[12] Given this underlying allegiance to laissez-faire ideology, a genuine appraisal of the world’s mounting imbalances has been obscured by the blind spot of “efficient markets” and “rational expectations” theory, leaving us unable to predict dangerous bubbles. Most people have been persuaded that money is just another commodity in the marketplace, its value determined by the prices of goods and services—which is why we tacitly support the policy commitments of the central banks to ensuring price stability and keeping inflation under control. This conviction has left policymakers and the public in denial about the familiar pattern of debt addiction and consumer spending that has resulted from their governments’ deficit spending and central banks’ oversupply of credit for the stabilization of financial markets—the very conditions which continue to inflate the superbubble.

Although modern society has learned to accept its boom-bust cycles as a fact of life, sooner or later we must face up to the essential problem that causes the economic system to create and recreate these financial crises. It’s time we recognize the entrenched pattern that has played out during every recession since the beginning of the era of international monetary deregulation.[13]

- Easy credit generates demand that pushes up the value of new financial products
- The distribution of these products is greatly expanded and generates high yields
- Greater numbers of people purchase these financial products
- The financial products are traded at inflated values
- Mispricing creates massive imbalances in trading between producers and investors
- A financial asset bubble builds
- The bubble bursts, resulting in heavy losses for investors, private banks, and financial institutions which have been over-leveraged
- Government treasuries or central banks rescue the affected private banks and financial institutions through fiscal or monetary bailouts (or both)
- A new round of financial speculation begins, since the private sector knows that the public sector will protect it from the downside risks of bad investment decisions through fiscal bailouts by taxpayers

---

[12] Policy makers in the Richard Nixon White House, including Director of the Office of Management and Budget, George Schultz, decided to take the US and the world off the gold standard in 1971 partly out of economic necessity (as described below in “Bretton Woods I: 1944-1971”) and partly out of a deep ideological conviction in free market policies. The philosophical constructs behind the decision to deregulate the monetary system had their roots not only in the economic theories of Friedrich von Hayek and his followers, but also in the schools of behaviorism, logical positivism, linguistic determinism, and ultimately, post-modernism. A full treatment of the ideological underpinnings of the global deregulatory policies which were initiated in 1971 is beyond the scope of this discussion.

[13] This general pattern applies to any speculative bubble in history. Unlike earlier examples, however, most of the asset bubbles that have developed since 1971 have not been in commodities, but in financial assets.

- interest rate cuts for savers[14]
- benefits for unemployed workers
- Moral hazard—the asymmetric incentives of public sector guarantees for the private sector—results in the development of a new generation of financial products with a higher degree of opaqueness and leverage
- This encourages greater credit expansion and risk taking
- A new asset bubble is created over the ensuing years

If this pattern sounds familiar, it should. We have already suffered through a number of these cyclic recessions (including 1973-75, 1980-82, 1990-93, 1997-98, 2001-02 and 2007-09), each one becoming a little larger and more damaging. The monetary superbubble which has been amassing behind these individual recessions cannot be measured in terms of price inflation—which has been the primary focus of central banks during the era of deregulation, despite the obvious structural imbalances arising from easy credit, low interest rates and rising asset prices. Predicting speculative bubbles is not like predicting earthquakes, although this seems to be the philosophy adopted by central banks and policy makers: not much can be done until the destructive aftermath. By keeping the rate of consumer-price inflation low and stable, while ignoring asset inflation, central banks have studiously avoided pricking bubbles. Instead, they prefer to clean up the damage after bubbles burst through interest rate adjustments.[15]

While an array of critics across the world has observed that our recurring economic crises are caused by deep distortions in the Bretton Woods system, few realistic proposals have been put forward that would end the relentless surge of free-flowing credit and debt-financed consumption that results in asset bubbles, crashes, and economic pain. Current economic policies are still generating enormous trade imbalances, uneven growth, and misaligned exchange rates, while proposals to reduce these asymmetries through higher wages and purchasing power are seldom considered. If central banks continue to pursue an expansionary monetary policy and inflate the money supply, the likely result will be another huge asset bubble in the bond market and a public debt crisis, leading to depression and mass deflationary conditions.[16] In the meantime, global leaders do not appear to be discussing international coordination for deep structural changes in the monetary system, even though the superbubble that is now forming in the global equity and bond markets has clear monetary implications.

How did it come to this? And what can be done? The Brandt Report, which foresaw the superbubble of a long-term government debt crisis, offers many clues and lessons. Before analyzing present conditions and future possibilities, the monetary proposals of the Brandt Report should first be set in their historical context.

---

[14] Interest rate cuts draw savers out of safer investments and into higher-yield investments.

[15] This was the policy of the Federal Reserve Board under the chairmanship of Alan Greenspan (1987-2006) and has been adopted by many other central banks. The idea that the central bank would come to the rescue of vulnerable private banks and financial institutions (by lowering interest rates and pumping liquidity back into the market) became known as the "Greenspan Put." Instead of creating stability, these practices contributed to further speculation and continued to inflate the financial and monetary superbubble.

[16] At the government's discretion, such deflationary conditions may be countered with hyperinflationary policies.

Historical Background

Bretton Woods I: 1944-1971

After the Second World War, many colonial nations achieved independence from their ruling countries. While this political liberation may have been genuine, economic freedom was another matter. These newly "developing" states still found themselves reliant on the world's rich nations for economic assistance.

Meeting in Bretton Woods, New Hampshire, in 1944, the United States, the United Kingdom and forty-two other nations launched a multilateral system that promised to meet the needs of the world's poor nations for economic development. The post-war economic system consisted of the International Monetary Fund (IMF) for crisis lending, the World Bank for development aid, and the International Trade Organization to negotiate and arbitrate the rules of international commerce and trade.[17] Along with the United Nations, which was established to create a new dimension of political security and peace in the post-war era, the Bretton Woods institutions were designed to create a new level of economic security across the world. For the first time in history, there would be an institutional framework for recycling international aid and credit in an orderly and stable way. Foreign assistance and loans would flow from rich nations to poor nations, and trade surplus and trade deficit nations would adjust their payments balances for mutual benefit. This new access to aid and credit, along with free competition, open trade, and private investment in the international marketplace, would be enough to lift the world's poor nations out of poverty and guarantee economic prosperity for all.

These expectations were soon disappointed. In spite of the world's new economic order, ex-colonial nations remained impoverished and marginalized, stuck with massive unemployment, low wages, and diminished purchasing power. The Cold War between the Soviet bloc and the West also created a complexity of barriers to international trade and financial flows. Still, the Bretton Woods economy had mixed success from the late 1940s through the early 1970s. Employment, economic growth, and living standards—especially for the industrialized countries of the North—improved at a rate unprecedented in history and in a climate of relative economic stability. Much of that achievement was due to the orderly and stable relationships between the different currencies of the international monetary system. The global economy was anchored by a system of sound money, supported by the US dollar serving as the dominant global reserve currency and the IMF facilitating the exchange rates between nations. Foreign central banks were allowed to redeem excess dollars at the fixed conversion rate of $35 per ounce of gold, which encouraged the expansion of world trade and the predictability and security of financial investment. For its member states, this new economic system proved a welcome relief from the massive monetary instability resulting from the breakdown of the international gold standard between the First and Second World Wars. After the social pain and suffering caused by those political conflicts and the Great Depression, the liberalization of the international economy toward redistributing global credit and alleviating poverty was widely regarded as a major breakthrough.

---

[17] In 1947, the International Trade Organization was replaced by the General Agreement on Tariffs and Trade (GATT), which itself was superseded in 1995 by the World Trade Organization (WTO).

Yet there was a flaw deeply built into the Bretton Woods framework from its inception, a fault which was obscured during most of the 1950s and 60s by the unrivaled strength of the United States as the world's economic engine and currency guarantor-of-last-resort.[18] This structural error, which continues to plague the international monetary system today, is that *deficit nations are forced by the marketplace and the international institutions to adjust their fiscal balances,*[19] *while surplus nations have no real incentives to make reciprocal fiscal adjustments for the benefit of deficit nations or for the monetary system as a whole.*[20] These discrepancies have led to fractious differences among governments over the anticipated impact of interest rates on loans and investments. For nations in deficit, debts must be paid on a timely basis; but for nations in surplus, financial assets can accumulate without time constraint or requirement of redistribution.

The weaknesses of this asymmetrical structure came into focus in the late 1960s when the United States began inflating its money supply to accommodate growing fiscal strains. To fund its "War on Poverty" and the Vietnam War, the US borrowed from abroad. This forced other lending nations (many of which had little interest in the domestic spending of the US or didn't approve of America's foreign wars) to absorb some of the inflationary thrust of US expenditures through their own fixed-exchange rates with the dollar. Disagreements emerged between the United States and several member states in the Bretton Woods system, particularly with France, West Germany, and Switzerland.

Investors and multinational corporations, seeking to avoid losses through significant swings in exchange rates, embarked on a huge dollar selloff. As foreign holdings of US dollars increased, US gold reserves dwindled, and the anticipation of a dollar devaluation increased the private demand for gold across the world. Countries with balance of payments surpluses questioned the capacity of the United States, with its rapidly growing balance of payments deficit, to honor its obligation to convert dollars into gold. In these shifting circumstances, markets and central banks demanded to know where they stood. Was their money stable? Was the US dollar creditworthy? Was the Bretton Woods agreement coming to an end? With pressures mounting on the international monetary system, President Richard Nixon suspended the convertibility of the dollar into gold on August 15, 1971. By closing the gold window, the international system lost its monetary anchor and exchange rates were left to float. The international monetary system had been deregulated and a very different and uncertain era was beginning.

---

[18] Eichengreen and Flandreu (2008). These authors would add that the underlying reason that the dollar dominated foreign exchange reserves in the post-war era was because the United States had liquid financial markets and no capital controls.

[19] The exception, of course, is the United States, which is not immediately forced to adjust its fiscal balances because of its reserve currency.

[20] I use the terms *deficit nations* and *surplus nations* to refer to countries with a deficit or surplus in their current account balance. A current account balance reflects the goods and services a nation imports against those that it exports, plus the net of foreign income, foreign aid, and transfer payments. A deficit nation earns less than it spends, while a surplus nation earns more than it spends. The implications of this for today's economy are described in more detail below in "Balance of Payments Adjustments" and "The Superbubble and the Dollar Crisis."

Bretton Woods II: 1971 - Today

Under Bretton Woods I, capital could not flow freely from one country to another because of exchange controls. When the United States decoupled its dollar from gold, the abrupt change from fixed to floating exchange rates put pressure on governments to reduce capital controls and liberalize capital flows. The era of Bretton Woods II, which began with the collapse of the previous system of fixed exchange rates, resulted in loose monetary policy and an explosion in world reserves.[21] No longer bound by convertibility restrictions, central banks were free to create as much money as they wished.

This created major currency volatility for all nations, presenting them with new problems in the management of their exchange rates, balance of payments adjustments, and foreign reserves. Currency instability, in turn, contributed to inflation, slow growth, and unemployment in rich nations. These conditions intensified in 1973-74 when oil-producing nations quadrupled the price of oil. As double-digit inflation, interest rates, and unemployment soared, and exchange rate volatility continued, Keynesian countercyclical policies—based on fiscal intervention in slumping markets—were under challenge. Economists like Milton Friedman and political leaders such as Ronald Reagan and Margaret Thatcher promoted free trade, unrestricted private investment, and open capital markets, arguing that government bureaucrats could not rival the ability of private markets in allocating capital.[22] They believed that macroeconomic policy ought to be geared toward creating low inflation, rather than full employment.

The major recessions of the 1970s had also affected developing nations. They, too, were severely impacted by oil and commodity price inflation, as well as the rise of broader consumer prices. Their agricultural and mineral exports and domestic incomes slumped and unemployment escalated, making it difficult to build the industrial sector. As foreign investment in developing nations slowed, these countries suffered considerably.

---

[21] Another school of thought contends that Bretton Woods II started about 2003, when the central banks of many emerging nations began to link their currencies formally or informally to the dollar, thus mimicking the system of fixed exchange rates during the period of Bretton Woods I. My view is that the Bretton Woods period did not simply end in 1971 and then restart in the early 2000s. I don’t believe that Bretton Woods should be defined merely as a system of fixed exchange rates. In popular thought, the meaning of “Bretton Woods” is characterized mainly by its original institutions—the IMF and World Bank—which have continued to operate as the world’s international economic institutions during the entire period since the 1940s, regardless of prevailing exchange rate policies.

[22] Although little recognized, much of the new political appeal of conservative economics in the late 1970s and early 1980s had its roots in the decision to close the gold window and liberalize the international monetary system. Floating exchange rates, loose monetary policy, the opening of markets, and the abolition of capital controls were all part of a policy continuum which set off an explosion of new credit instruments beginning in the early 1970s. This created the “stagflation” which, as is well known, helped to discredit Keynesian theory. But this new credit also made it easier for lenders to enter the home-loan market, and for homebuyers to obtain credit. This mass availability of credit had a major impact on Western politics, as conservative parties persuaded voters to shun higher taxes and reverse the redistributive policies of the social welfare state. As a result, popular conservative support for supply-side economics grew and national Keynesianism fell into political disrepute in the US, UK, Europe, Canada, Australia and elsewhere.

Under Bretton Woods I, the mission of the IMF had been to monitor the international economy and support the system of fixed exchange rates and stable money, which would promote free trade for the benefit of all nations. Under Bretton Woods II, the mission of the IMF was recalibrated for the era of floating exchange rates and monetary and financial deregulation. The IMF turned into a central planning authority, managing economic policy in developing nations by opening their economies to foreign capital as a condition for receiving cheap loans. But the IMF's drastic conditionalities on lending—sharp reductions in public spending and domestic consumption, currency devaluations and higher taxes—"tended to impose unnecessary and unacceptable political burdens on the poorest, on occasion leading to IMF riots and even the downfall of governments."[23]

By the early 1970s, it had become evident that many of the promises of the new international economic system had failed. Aid, loans, and investment were not ending world hunger and poverty—these conditions were growing only worse. A number of economists and policymakers began to call for a restructuring of the international economic system, particularly in the areas of trade, technology, finance, monetary policy, energy, commodities, food, and agriculture. By the late 1970s, many developing countries, disappointed with the prospects of socialism and communism, were looking to a new kind of "global Keynesianism" for answers. Many believed that a restructured international economic system was needed to generate an emergency relief program for developing nations and stimulate the global economy.[24]

Yet North-South discussions were at an impasse.[25] "Between the Bretton Woods and the United Nations institutions, each with their own language and assumptions, there remained a difference of orientation and power. The South had majority votes in the General Assembly which gave assurance of passing resolutions; but the North's position in the World Bank and

---

[23] Brandt Commission (1980, p. 216)

[24] In this view, rich nations would stimulate the global economy, not through economic policy within their own borders, but by enhancing the economic development of poor nations across the world. Helping these nations would also make them better trading partners for the world's rich nations, thereby benefiting everyone.

[25] The "North-South" metaphor has never been an adequate framework for explaining global economic and social imbalances. Generally, the global North refers to the world's richer, more developed nations, while the global South refers to the poorer, developing nations. Assigning regional sectors to these classes of economic development is obviously a gross generalization. Besides the problems of geographical anomalies (e.g., Australia as a developed nation in the South), the terms "North" and "South" do not reflect changing circumstances: many of today's emerging nations, which were formerly developing nations, are still associated with the global South. Although "North-South" remains a useful shorthand for the broad distinction between the extremes of global development, economically and socially, the assumptions behind "developed" and "developing" nations need to be re-examined. (Perhaps a more empirical way of referring to the extremes of wealth is a terminology based on the national current account balance, i.e., "surplus" nations and "deficit" nations. I prefer this terminology because it goes right to the heart of the world's structural imbalances without moralizing upon the meaning of the economic and social discrepancies, which often frame the world's rich and poor as abusers and victims and reinforce historical barriers in the international dialogue on development. This is not to deny past injustices, but to suggest that the personal, social, and cultural differences in global economic and social development should find some new means of expression in the international negotiating framework. Recent research and activism involving the *global commons* has been headed in that direction.)

IMF gave it control over key areas of money and finance."[26] As the dialogue on development faltered, Willy Brandt—the ex-chancellor of the Federal Republic of Germany who had won the Nobel Peace Prize in 1970 for his work in East-West relations—was asked by World Bank President Robert McNamara to lead a North-South commission to analyze the current conditions of world poverty and the prospects for international development.

Brandt's group—comprised of high-level economists and politicians with a wide range of geographical and ideological perspectives—called for an international emergency relief program for developing nations, which was to be supported by a new international economic system. To lift the world economy out of recession in the short term and achieve lasting economic growth, the Brandt Commission advocated that rich nations provide a major stimulus of aid, loans, and technology to poor nations. "We insist," the commission declared, "that longer-term measures of reform will be essential to the international financial and trading system, without which recovery and growth could not be sustained."[27]

They argued that an expansion of markets in the global South would create more production, fairer prices for raw materials, higher wages, and a cleaner environment. In turn, this would benefit the global North by boosting employment through the expanded production of goods to sell to the markets of developing nations. "The large-scale transfers we will propose are seen therefore as measures both to support growth in developing countries directly and to permit a significant expansion of world trade. It is in this sense that we view them as contributing to growth and employment creation in the North as well as the South."[28]

The idea of a "global stimulus" didn't catch on until the past few years. During the period from 1982-2007—characterized by high production, stock market prosperity, and relatively low inflation in the North—few policymakers discussed ideas about boosting economic development in the South to rejuvenate the global economy. Particularly after the Cold War ended and the pace of globalization speeded up, most of the world's non-aligned nations no longer had the political option of choosing neutrality from the rapidly globalizing economic system. Virtually all nations in Latin America, Asia, Africa, the Middle East, and Eastern Europe gravitated toward the global marketplace, not only for trade and finance, but as the primary means of fighting poverty and promoting international development.[29]

The span of years from 1982 to 2007 was a time of remarkable growth for many rich and emerging nations, yet the rate of global poverty, social inequality, environmental degradation, and climate change also continued to increase across the world. As the Great Moderation ended in the United States, both the Bush and Obama presidencies abandoned the supply-side ideology of the Reagan era. Each administration embraced old-fashioned national Keynesianism, fostering stimulus bills of $152 bn in 2008 and $787 bn in 2009 to generate effective demand. With the election of a Democratic Congress in 2008 and the increased attention on global warming before the 2009 United Nations Framework Convention on Climate Change in Copenhagen, the idea of Green Financing also became a popular platform in the sustainable development community, echoing proposals originally made by the Brandt Commission for "an orderly transition from a world economy and industry based on oil to one that can be sustained through renewable sources of energy."[30]

---

[26] Brandt Commission (1980, p. 38)

[27] Brandt Commission (1983, p. 13)

[28] Brandt Commission (1980, p. 68)

[29] As many of these nations industrialized and attained stable economic growth, they came to be seen as a kind of global middle class emerging from the lower class of developing nations. Hence, the terms "emerging markets" and "emerging nations" came into parlance in the early 1990s.

The Brandt Report has often been viewed as a form of global Keynesian policy.[31] This is true to a large extent. The report was written just as national Keynesian policy was failing, and many of the Brandt Commission's ideas were designed to recreate Keynesianism at the global level to make it more viable in sustaining international demand.[32] Since that time, however, the drawbacks of Keynesianism have become increasingly apparent. When he developed his economic philosophy during the 1920s-1940s, John Maynard Keynes was primarily addressing the needs of the world's industrialized nations for increasing employment and consumption.[33] With the advent of globalization, industrialized economies are no longer as focused on their own domestic markets as they were in earlier years, which limits the effect of large-scale stimulus programs as multipliers of consumer spending for national economic recovery.

In addition, most proposals for global Keynesianism have failed to effectively address the problem of the overcapacity of production. Since the 1970s, global productive capacity has outpaced the growth of effective demand, suppressing global wages, incomes, and purchasing power. The more that countries industrialize, the more acute this problem has become. The supply-side policies that produced the Great Moderation—deregulation, liberalization, and privatization—have deepened the crisis of overproduction through easy credit and rising asset prices. These asymmetries in productive capacity are the result of an ideological and political commitment to letting "market efficiency" and inflation reduction sort out the global imbalances between countries with payments surpluses and deficits.

---

[30] Brandt Commission (1980, pp. 168-169). A "Green New Deal" between the global North and global South would mean that rich nations would reduce their production, consumption, and carbon emissions, while poor nations would receive credit, investment, and new technology while pursuing their economic development. At the same time, both North and South would reduce reliance on fossil fuels, implement energy efficiencies, create clean technologies, develop renewable energy, clean up natural systems, and establish a culture of sustainable growth.

[31] "The [Brandt] report's simultaneous expansion and internationalism within a framework regulated by governments and international institutions made it a true successor to Keynes' visionary schemes of the 1940s" (Newton, 2004, p. 118). What were these forward-looking plans envisioned by John Maynard Keynes? As part of the international exchange system discussed at the Bretton Woods conference, Keynes had proposed a new adjustment mechanism—a yearly fee or circulation charge which would encourage trade surplus nations to actively spend, invest, or loan their surpluses for the benefit of deficit nations, rather than hoard them. Although this proposal was rejected by the United States at Bretton Woods, there is much to be said in favor of Keynes' essential concept of an International Clearing Union and negative interest rates, requiring nations with trade surpluses to recycle their excess. Since the Brandt Report did not broach this topic directly, however, it is best left for another occasion.

[32] Unlike other proposals for global Keynesianism, however, the Brandt Report combined economic stimulus for development with comprehensive monetary restructuring. Many recent proposals, like those for a Green New Deal, have focused primarily on financial stimulus without recognizing the necessity for changes in the global monetary system to support that stimulus. Few environmentalists, bankers, and policymakers have seemed to recognize that their goals would be better served by seeking "carbon value" through the currency system rather than a "carbon price" in the marketplace or a "carbon tax" through government policy. Several generations of policymakers and activists have now accepted the popular idea—promulgated by a few prominent twentieth century economists—that the value of money is simply a function of market prices. Brandt's emphasis on a new monetary system as the underpinning of sustainable development would reverse this entrenched thinking.

[33] As David Martin (2009) notes, in focusing mainly on the volume of employment and consumption needed to achieve effective demand, Keynes did not adequately factor in the underlying wealth of labor and natural resources from which that demand arises.

Brandt's Monetary Agenda

While fighting price inflation may be good policy for ensuring stable economic growth, the post-Keynesian overemphasis on inflation has also been destabilizing. Since the early 1980s, when attempts to achieve price stability by controlling money were abandoned, inflation targeting became the new focus of central banks. Influenced by market polemics, many economists and bankers adopted the view that price inflation could be modeled and controlled without paying much attention to the value of money. Rather than meeting long-term monetary targets, central banks would use their own money to determine short-term interest rates and ensure a broad balance between overall supply and demand for the medium term (usually a few years). Thus, instead of seeking to control inflation indirectly, central banks began to aim expressly at price stability.

The fact that these monetary practices have now become mainstream policy does not validate them. Ultimately, the adjustment process should not be the task of either markets or central banks—it should be the task of the international system itself. Markets cannot protect against systemic risk; guarding against systemic risk is one of the main reasons that we have central banks. Yet through inflation targeting for the financial sector, central banks have actually contributed to systemic risk by allowing exchange rates to build up implicit monetary imbalances at the global level. While emphasizing price stability, central banks have also encouraged the huge surges of credit that lead to asset inflation, which is the real source of the underlying global imbalances in saving and investment. As the Brandt Report anticipated, without a way of stabilizing these major financial distortions and asymmetries internationally, the underlying superbubble will continue to build until it bursts and the entire system collapses.

The inherent tension between export-led and import-led economic development is not an easy matter of supply canceling out demand. It is extremely difficult to ensure global economic balance when the domestic economic infrastructure of one group of nations is geared primarily toward production, while the infrastructure of another set of nations is oriented largely toward consumption. What makes this imbalance particularly challenging is that the liquidity in the global economy is already skewed toward global supply and production capacity, which creates instability in the entire system. *A major international financial adjustment is needed to clear the superbubble that has resulted from the different incentives and timeframes in the balance of payment imperatives of surplus and deficit nations—which allows surplus nations to accumulate financial assets without recycling them, while requiring deficit nations to pay their debts* and *adjust their fiscal balances.*

It’s clear that neither global poverty nor climate change are going to be tackled simply through a major stimulus package of aid, loans, trade, and investment from the global North to the global South. Certainly, a global stimulus can provide important short-term economic growth. Yet far more is needed. As the Brandt Report indicated, an effective global stimulus must also be accompanied and supported by a massive increase in income distribution, wage levels, and purchasing power through deep changes in social and monetary infrastructure: for “in the long run countries have to strengthen their capability to sustain development through structural transformation.”[34] The Brandt Commission stressed that *any international program to merge the developmental needs of the South, the underused capacity of the North, and the needs of the entire world for a low-carbon environment, must be directly linked to the restructuring of the international monetary system*.

The Great Recession of 2007-09 has focused the world’s attention on the need for a new monetary system. China, Russia, Brazil, India, France, the United Nations Conference on Trade and Development, and the UN Conference on the World Financial and Economic Crisis—along with many other states and international agencies—have expressed apprehension about the world’s widening trade imbalances, distorted growth, and misaligned exchange rates. These were the same concerns voiced by the Brandt Commission. “The current monetary disorder, together with the growing tides of protectionism and persistent inflation and recession, could have increasingly dangerous consequences for all countries,” said Brandt. “There is thus an urgent need to establish a mutually agreed international monetary order which would take into account the changes in the world environment since 1944.”[35]

It’s clear that the path that the world embarked upon at the Bretton Woods conference hasn’t worked and isn’t going to work. It’s time—past time, since these problems have been evident for decades—to think about creating a new international financial architecture, including a restructured currency scheme to reverse or eliminate the systemic errors in the present system. In this regard, Brandt’s team of experts developed a monetary agenda that remains highly relevant today.

“The Commission believes that reform of the world monetary system is urgent and must address itself to the following issues: the *exchange rate regime*; the *reserve system* (the creation and distribution of the international means of payment or liquidity); and the *[balance of payments] adjustment mechanism* as it affects the countries using reserve currencies, surplus countries and deficit countries.”[36] The Brandt Commission also called on nations to re-examine the *international role of the dollar* and to prepare for a new *global monetary conference* to discuss all of these issues in a comprehensive way.[37]

---

[34] Brandt Commission (1980, p. 63)

[35] Brandt Commission (1980, p. 206)

[36] Brandt Commission (1980, p. 207)

[37] Another proposal—closely related to these—is the Brandt Commission’s call for automatic international financing, which continues to be the subject of much international discussion. Essentially, the Brandt Report called for a small surcharge or tax on income, production, consumption, or trade involving exchanges across international borders. New global programs and institutions for sustainable development could be financed through fees on international corporations, international investment, foreign exchange transactions, international trade, international airline tickets, maritime freight transport,

It is worth examining each of these topics now, thirty years after the publication of the Brandt Report, in light of the current state of the world economy.[38] The next section, "Present World Conditions," will focus on the exchange rate regime, balance of payments adjustments, and the reserve system. The last section, "Looking Ahead," will focus on the dollar crisis and the need for a global monetary conference.

Present World Conditions

Exchange Rate Regime

The exchange rate is a ratio between two currencies which indicates how much one is worth in terms of the other. It is the means by which one nation's currency is valued against other national currencies for purposes of trading and exchange. The accounting of national monetary values was fairly straightforward under the system of fixed exchange rates. Since the 1970s, however, when exports and imports began to be invoiced in currencies with widely fluctuating values, differences between the real earnings from exports and the real cost of imports have frequently arisen. These discrepancies have created significant problems for producers and traders, as well as for central banks managing external debts.

Under the new system (or "non-system") of floating exchange rates, government economists and politicians quickly realized that changes in the exchange rate could be used to manage the domestic trade balance for the benefit of the nation and its producers.[39] Hence, when central banks and governments buy and sell currency in foreign exchange markets, they are largely motivated by the same goals as those of primary exporting nations seeking price advantage in global commodity markets.[40]

All national currency is now *fiat*—created by central banks virtually out of nothing (since the costs of producing money are negligible).[41] Because currencies are a medium of exchange and not a commodity like wheat or iron ore, their "market" price essentially depends on the decisions

---

ocean fishing, sea-bed mining, offshore oil and gas, international oil trading, satellite parking spaces, electromagnetic spectrum use, military spending and arms exports, toxic wastes, hydrocarbons and exhaustible resources, and energy consumption. The Brandt Commission believed that these measures were essential in funding a new international economic system. However, since these transborder fees are financial rather than monetary, I have not included them as part of Brandt's monetary agenda. Rather than focus on the financial side, I've concentrated on the monetary conditions that will support the creation of measures for global financial stimulus and automatic global financing.

[38] For purposes of narrative flow, the topics of Brandt's monetary agenda are arranged in a slightly different order in this article.

[39] A central bank's interventions in foreign exchange markets to push exchange rates higher makes a country's imports cheap but can lead to domestic demands for protection and subsidies; on the other hand, interventions to push exchange rates lower can create commercial and political pressures in other countries for trade discrimination and retaliatory measures.

[40] When the press reports on governments "cooperating" to influence exchange rates, what it really means is that their central banks are employing monetary strategies to manipulate foreign currency markets.

[41] *Fiat* is a Latin term for "let it be done." Fiat currency is money decreed by a government to be legal tender.

of central banks as to how much money to print. Thus, in the era of floating exchange rates, neither exchange rates nor currency supplies are determined by market forces, as many people assume, but are strategically established by a cartel of central banks. When the world economy switched over to these floating exchange rates, central bank interventions in the currency markets seemed like a good way of substituting for the earlier stability of fixed rates. In theory, this manipulation of foreign currency exchange rates promised the kind of predictability and order that the gold standard had provided, but in practice this has not been the case. There are two reasons why the strategic manipulation of exchange rates is not working effectively and is actually contributing to global economic imbalances.

The first reason is financial. During the period of the Great Moderation, most bankers, investors, and policymakers assumed that the new era of credit was beneficial for the economy as a whole. Bankers were happy to extend new loans to investors, investors were profiting, and regulators were pleased to see the banks alleviating credit risk. But easy credit and financial innovation masked the symptoms of the emerging superbubble. Under the old system of fixed exchange rates, banking had been relatively simple. When banks extended loans, they kept them on their own books using rudimentary accounting measures. After the monetary deregulation of 1971, however, banks started selling their credit risk to off-book investors in the growing capital markets. The advent of computers and quantitative methods for managing credit risk also contributed to the proliferation of credit-based instruments using off-book accounting. Without a system of managed exchange rates, accounting standards were blurred and a great deal of ambiguity developed. Although exotic financial products were marketed as the latest form of free-market innovation, many of the new financial instruments such as collateralized debt obligations were never really traded in the marketplace at all. They were valued through the algorithms of complex theory rather than through actual market pricing. As banks lost track of their own *mark to market* accounting, regulators also lost track of the banks' capacity to trade and price assets in a credible way. Hence, exchange rates based on these calculations have also misrepresented the real value of assets.

The second reason for the failure of exchange rate manipulation is monetary. In the global exchange rate regime that emerged after 1971, some developing countries have chosen floating or "crawling" exchange rates, while most are linked to a major currency or to a basket of currencies. By pegging their currencies to the dollar, nations like China have to purchase more dollars to prevent their currencies from appreciating, which can lead to inflation. This arrangement is highly contradictory: although their currency values rise and fall with the value of the dollar, the export-driven incentives of nations with undervalued currencies are the very opposite of the import-led model of economic growth in nations like the US. This means that high-growth, producing countries which are pegged to the dollar must suffer the deflationary consequences of any drop in the dollar's value. If these countries are also running surpluses and accumulating savings, their investment and consumption is less than what it would otherwise be if their currencies weren't linked to the dollar.

In 1994, China's central bank fixed the yuan at an exchange rate about 8.28 to the dollar. Since China began generating a large surplus in its trade with the US, it's been widely argued that the yuan is "undervalued." Critics say that China should allow its exchange rates to appreciate, which would reduce its trade surplus and allow it to consume more, while increasing

US exports and savings and lowering the US trade deficit. This logic is disputed, however. Some economists believe that an appreciation of the yuan against the dollar could actually cause investment in China to decline, increasing China's net savings and trade surplus with the US. For its part, China does not think that its manipulation of exchange rates is the cause of global imbalances, which it says are largely the result of cheap money, inflated demand, and asset bubbles in the United States.

Although the large foreign financing of America's negative current account has been grabbing the news headlines for several years, major global imbalances of this sort are not a recent problem. Over time, the scope of the economic distortions caused by the overextension of credit and the overcapacity of production has certainly broadened, but the issue is hardly new. For several decades, world demand has been in need of rebalancing, including deep changes in the pattern of national and global trade, finance, and monetary activity. The Brandt Commission advised in 1980 that greater international coordination was needed to prevent currency manipulation from resulting in exchange rate instability, distorted capital flows, and prolonged current account imbalances. It said that "key elements of monetary and fiscal policy should now be under urgent cooperative review by governments and central banks so that an appropriate pace of expansion can be agreed on and set in motion, and a better relation among exchange rates be maintained than has recently prevailed."[42]

The failure of central banks to manage these imbalances through the exchange rate process brings up a broader question. Is the economic conflict today between China and the US simply a matter of resetting exchange rates between the yuan and the dollar? Or is it a larger matter of adjusting payments imbalances between the "surplus" saving of China and the saving "deficiency" of the US?[43]

Balance of Payments Adjustments

A current account balance measures a nation's income relative to its spending. All the trade flows of goods and services, charitable contributions, foreign aid, and other international payments are weighed in terms of what comes in and goes out of the country. Generally speaking, a nation's current account indicates whether it is mostly saving or borrowing from abroad.

From a quick-glance standpoint, China and the US both appear to be thriving. By the measures of the Great Moderation, the economic relationship between these two superpowers has provided prosperity and economic growth with modest inflation for both nations and many of their trading partners. Yet this growth has resulted from a global economic system that is engineered to create and recreate asset bubbles and trade imbalances. As noted earlier, *there are different structural incentives for nations which have balance of payments deficits and surpluses. Through the enforcement mechanisms of the international economic system, deficit nations are required to make timely adjustments, while surplus nations are not required to make reciprocal*

---

[42] Brandt Commission (1983, p. 42)

[43] I'm using the terms saving "surplus" and saving "deficiency" here in terms of the financing that is required for domestic investment.

adjustments. Hence, poor nations are obligated to pay their debts or roll them over, but rich nations are not required to recycle any of their surpluses for the benefit of poor nations.

The flaw built into the Bretton Woods system—that deficit and surplus nations must follow these different modalities—has led to two mutually-dependent models of economic development and growth. There is the model of export growth, over-saving, and underconsumption in many Asian nations like China and Japan, as well as Germany and the petrodollar states. And there is the model of cheap imports, low-cost foreign loans, and debt-financed consumption in nations like the United States and the United Kingdom.[44] These are two vastly different structures within a single global economy.[45] The question is, how did this imbalance occur? Why does Asia save and the US borrow? Let's start with Asian thrift.[46]

Since the late 1960s, the terms on IMF lending had been very tough on developing nations. Typically, as a condition for receiving a new loan, a nation was forced to balance its budget, curb its money supply, cut subsidies, and readjust its exchange rates. In effect, poor nations were being penalized for their incapacity to produce tradable goods and services through austerity measures that further eroded their structural deficiencies. As the Brandt Commission observed, "in many cases these measures reduce domestic consumption without improving investment; productive capacity sometimes falls even more sharply than consumption. This is because many developing countries with deficits have a shortage of food or of basic consumer goods or cannot readily shift resources in line with their new needs."[47]

Throughout the 1980s, Latin America and Africa experienced a lengthy debt crisis with periodic loan interventions from the IMF, although much of Asia was spared. Well into the 1990s, many nations in Southeast Asia had been enjoying heavy foreign capital investment, rising asset prices, and high economic growth rates. Yet these countries were also running large current account deficits while holding limited foreign reserves. In 1997, asset prices collapsed. International lenders lost their appetite for risk and quickly withdrew their funds. Capital flight began in Thailand and quickly spread to Indonesia, South Korea, Hong Kong, Malaysia, Laos, Singapore, Taiwan, and the Philippines, causing financial markets and economies to collapse throughout Southeast Asia and raising fears of a worldwide economic meltdown.[48] The IMF stepped in with bailouts totaling $40 bn. These rescue packages were tied to drastic economic reforms—cutbacks in government spending, currency devaluations, forced bank failures, and higher interest rates.

Essentially, the IMF imposed draconian measures on these defaulting nations to restore the confidence of the international community in the stability of their currencies. As a result, many of these countries were forced to restructure politically and financially. The anger against the IMF's harsh structural adjustment policies was strong and lasting. Chastened by a difficult debt crisis, many of these nations pledged to protect themselves against further speculative attacks and also from having to borrow from the IMF again. Over the next decade, Asian central banks began to increase their savings by accumulating foreign exchange reserves in dollar assets and building up large current account surpluses.

---

[44] This disequilibrium is expressed in the cliché that grew popular during the past decade: "Asians produce products, export, lend, and save; Americans import, consume, and borrow."

[45] As globalization led to greater global economic integration, it also exacerbated the imbalances inherent in the Bretton Woods system. A primary example is the China-US relationship, which is not a case of mutually beneficial dependence, but of unequal co-dependence.

[46] The United States penchant for borrowing is analyzed below in "The Superbubble and the Dollar Crisis."

[47] Brandt Commission (1980, p. 216)

[48] The financial contagion also spread to Brazil and Russia.

This imperative to save spread from Asia to other nations. In 1996, the year before the Asian financial crisis began, developing economies worldwide were running a combined current account deficit of $78 bn. By 2008, this had turned into a surplus of $4.7 trillion, or about 75% of the world's $6 trillion of foreign exchange reserves.[49] For some nations, such as the oil-producing Middle Eastern countries and Russia, this accumulation of assets reflects the surging price of commodities. In other cases, surplus nations are manipulating their exchange rates downward against the dollar to boost export growth and increase their currency reserves and current account positions. In both instances, the wealth is controlled by governments, either directly or through state-owned companies, rather than by individuals or companies.[50]

The Great Recession affected all countries. Asset prices and demand for goods and services declined and credit markets tightened. Both nations with current account surpluses, and nations with current account deficits, suffered declines in growth, although to varying degrees. To fight the recession in 2008-09, the central banks in many deficit nations cut interest rates (and some expanded their money supplies), while their governments created massive stimulus packages. These interventions were modestly successful in promoting domestic recovery. By borrowing and spending to raise demand for the world's surplus output, deficit nations helped prevent the recession from spreading to surplus nations. But for surplus nations, the incentives to run big current account surpluses did not change as a result of the recession. In fact, China, Japan, and Germany ran huge current account surpluses from 2007-09 and seem intent on increasing their savings at the risk of suffering declines in domestic demand and increasing fiscal deficits. Despite (or because of) the stimulus packages created to fight the recession, the current account imbalances among national economies continue to widen and the underlying monetary disequilibrium has become much more pronounced.

Although the recession has dampened demand for its goods, the meager level of China's 2009 government fiscal deficit and the strength of its massive surpluses indicate that China is set on revving up its exports, expecting a recovery in foreign demand. Other surplus countries also seem to be anticipating that export-led growth and external demand will moderate their withdrawal of domestic stimulus measures and drive their recoveries. But the credit bubble in the deficit nations has not been abated and the expected fiscal deterioration in these countries is still much greater than in the surplus countries. Although the US, UK and Spain spent less, saved more, and reduced their trade deficits between 2007-09, actually shifting their financial balances toward surplus, the fiscal deficits in these nations are still much larger than in surplus nations. Rather than provide a source of global consumption as in the past, countries such as Spain, Greece, Portugal, and Ireland[51]—along with the US and UK—now represent increased credit risks following years of debt-driven expansion, lack of fiscal discipline, and structural deficiencies.

---

[49] Hale (2010)

[50] Ben Bernanke observed in 2005 that there appeared to be a "global saving glut" forming, particularly in fast-growing emerging economies and among oil exporters. (http://www.federalreserve.gov/boarddocs/speeches/2005/200503102/default.htm. From this angle, the central banks and sovereign funds of these nations were accumulating their reserve surpluses from excess US consumption.

These internal government deficits—needed to offset chronic current account deficits and sharp declines in private spending—are not sustainable. In effect, surplus countries are still depending on the private sectors of deficit countries to do their borrowing for them. But nations with low rates of saving like the US and UK can no longer play the role of consumer-of-last-resort. Deficit countries simply can't absorb infrastructure spending or tax cuts that could generate economic growth because of the monetary interest payments on their debt.

Given their large surpluses and foreign currency holdings, surplus nations could provide the engine to get the global economy going again, whether by redistributing their surpluses to simulate demand abroad, or by stimulating demand at home. In the interests of global monetary adjustment, surplus countries like China and other Asian nations, Japan, Germany, and the oil-exporting states, need to expand their economies. This could be done by slashing taxes on consumption, increasing investment in infrastructure and the service sector, stimulating domestic demand, and adopting exchange rate regimes that are less geared toward saving and building up trade surpluses and currency reserves.

The massive monetary expansion engineered by the world's major economies to protect themselves from the effects of the financial crisis has temporarily reduced the economic pain, but only by deepening the underlying monetary imbalances of the superbubble. The US and European governments have delayed the rise in saving which they require, while China has poured more money into increased production. The undervaluation of Chinese currency—which increases tradable goods production within China—is not only driving trade imbalances with nations like the United States, it is also crowding out traded goods production in developing and emerging markets.[52] International measures for better regulation are important, but still represent an attempt to preserve the current system of unsustainable growth and overproduction, rather than finding a permanent cure for chronic global excess. Instead of facing the real structural challenge of monetary imbalances, governments insist on reinflating the next bubble, dealing with the symptoms of the illness but not the illness itself.

It is not enough now to ease the pressures on the global economy: the world needs a purposeful monetary design. Sooner or later, there has to be an international agreement for an adjustment process that rebalances the world economy and eliminates the superbubble. Part of the solution is in changing the policies of surplus countries. But it will also require reformulating the international monetary system—which has been responsible for this major misallocation of capital—so that the capital incentives of surplus and deficit nations are thoroughly transformed.

---

[51] The fiscal deficits of these nations have been unsettling for the neighboring states of the European Union, as well as for the global economy. The risk of financial contagion from these countries rattled global markets in early 2010.

[52] Landler (2010). The yuan is undervalued somewhere between 25-40% relative to the dollar and other currencies, according to most estimates.

An international adjustment mechanism is required that will keep money circulating in a stable and predictable way so that it flows to where it is most needed. Because the world's vast pool of excess savings and the inability to recycle them are at the heart of the global economic crisis, the Brandt Commission stressed that the adjustment process should be placed in the context of maintaining long-term economic and social development.[53] The need for economic and social development applies both to surplus nations, which often restrict their domestic spending on social services and infrastructure while boosting their savings and currency reserves; and also to deficit nations, which bear the burden of adjustment through reductions in employment and public spending while paying down their debts.

"A reformed international system must provide incentives and mechanisms for adjustment by both surplus and deficit countries. The world economy will always display payments imbalances. Since deficits have their counterpart in surpluses, a reformed system must ensure that both surplus and deficit countries have some obligation to adjust. In the past, it was only when deficit countries turned to the IMF for credit that adjustment mechanisms were internationally enforced. Means should therefore be devised, through the IMF or otherwise, to encourage countries in current account surpluses to make long-term loans to deficit countries that are undertaking needed adjustment."[54]

Reserve System

International reserves are the means of making international payments and managing liquidity. Reserves are generally authorized by central banks and held by treasuries as a stock of international purchasing power. Since 1944, the US dollar has been the world's reserve currency, which individual nations may (or may not) choose to become part of their reserve assets.[55]

There is no automatic mechanism for keeping these reserves in balance on a global basis. Because of the structural error in the Bretton Woods system—that adjustment imperatives for balance of payments differ for deficit and surplus countries—internal reserves can be used either to finance balance of payments deficits or to store "surplus" savings. *When deficit countries turn to the International Monetary Fund for credit, the adjustment mechanism becomes operative and is internationally enforced. Deficit nations are required to make payments on their loans. Yet surplus countries are not under any similar international obligation because there is no adjustment mechanism for recycling their trade surpluses and currency reserves.* As long ago as 1980, the Brandt Commission had noted that the expansion of world liquidity was not helping the adjustment process because these reserves were being squandered by the world's surplus nations. "Although the aggregate of world reserves has risen," said Brandt, "their distribution has been highly concentrated and does not accord with any measure of reserve needs."[56]

---

[53] This is why the new global economic system must be centered on sustainable development, although many current advocates of sustainable development have not grasped the macroeconomic context that is needed to support it. New financing and new technology by themselves will not reduce climate change, create a low-carbon civilization, or meet the UN Millennium Development Goals.

[54] Brandt Commission (1980, pp. 213-214)

[55] As noted above in "Exchange Rate Regime," a central bank often buys and sells international reserves to influence exchange rates and stabilize the value of its domestic currency. This enables a central bank using a flexible exchange rate regime to clear excess demand or supply by purchasing or selling a foreign currency. For a central bank that is pegging its exchange rates to the dollar, increases in demand for the currency will push its value higher, and decreases will lower its value.

The dollar is now about 40% below its value from 1971.[57] At the moment, many countries like China are hoping to minimize the risk that the value of the dollar will decline further as the economy recovers, but they hesitate to sell high volumes of dollars for fear of triggering a fall in its value. In 2008, China expressed deep concern that the gaping US budget deficit could undermine the value of its huge dollar holdings. This has motivated China to call for a global currency to replace the use of the dollar as an international reserve.

Various proposals have been made for a new global currency. The idea has surfaced that the euro could replace the dollar, but several highly indebted states (Portugal, Ireland, Greece and Spain) have been undermining the confidence of global investors and central banks in the euro and in the political cohesion of the European Monetary System. Some pundits have nominated the yuan for the next global reserve currency and the Chinese government has taken some small steps toward internationalizing it, but China is a long way from developing the deep and open domestic markets necessary for capital convertibility. In the case of both the euro and the yuan, there are misgivings in nearly all countries about allowing a single bloc or nation to control global monetary policy again, as Great Britain and the United States have done previously. Historically, single-nation reserve currencies have encouraged distorted capital flows, misaligned exchange rates, and unstable balance of payments adjustments, contributing to major global economic imbalances.

The Brandt Commission called for a new global reserve currency to increase global liquidity and improve the adjustment mechanism. "It is in the international interest, indeed it is a purpose of the IMF" said Brandt, "that countries should be provided with adequate short-term resources so that they are not forced into measures which may be harmful not only to themselves but also to others by balance of payments pressures which are only temporary in their incidence. For this reason new reserves should be allocated to those countries which are most likely to experience balance of payments deficits and high domestic costs of adjustments, and least likely to be able to finance them from alternative sources. Many developing countries fit into these categories: a low level of development and a high concentration of primary production tend to increase both their export earnings instability and their costs of adjustment. At the same time, they have limited access to international capital markets, and relatively high opportunity costs of reserve acquisition. There is therefore a strong case based on efficiency as well as equity for a larger share of new unconditional reserves to be distributed to the developing countries than is achieved through allocations proportional to the IMF quota system. This is the underlying rationale for what is often referred to as an 'SDR link.'"[58]

The SDR is a Special Drawing Right issued by the International Monetary Fund. SDRs were created in 1969 to meet the demands of central banks for an orderly increase in official reserves, a decreased dependence on the dollar, and a reduction of global imbalances in money and credit.

---

[56] Brandt Commission (1980, p. 209)

[57] Norris (2007). The 40% decline in the value of the dollar since 1971 is a Federal Reserve Board estimate derived by periodically comparing the dollar with a basket of currencies.

[58] Brandt Commission (1980, p. 212)

As the Brandt Report explained, "An SDR is essentially a line of perpetual credit in the IMF on which member countries can draw, under certain conditions, to obtain the foreign currencies they need to settle their payments deficits. Its use is limited to central banks and treasuries, as well as the Bank for International Settlements. ... But an SDR has one outstanding feature: it is the only means of meeting international payments which has been established through international contract; for gold and reserve currencies as reserve assets are created by unilateral action (production and sale of the metal, US running balance of payments deficits) and their status is based primarily on custom. The SDR therefore represents a clear first step towards a stable and permanent international currency."[59]

Although they are in only limited use, SDRs could be especially important in times of national economic volatility, since they allow for the international creation of money and the expansion of liquidity without adding to the global surplus of dollars. Presently, SDRs are denominated in four currencies which are included in a basket comprised of about 44% US dollars, 34% euros, 11% yen, and 11% pound sterling.[60] A full-scale SDR system would allow countries to share the costs and benefits of managing its reserves, as SDRs and domestic currencies are swapped between national treasuries and a substitution account at the IMF. Using a currency basket for an expanded distribution of SDRs would also mean that no single currency holds an unfair advantage.

Yet there are several challenges to the adoption of SDRs. While they have been available for over forty years, SDRs have become only a small addition to—not a substitute for—international reserve currency holdings. In 2008, US dollars made up 64% of the world's foreign currency reserves, while SDRs comprised only about 4%. Therefore, a broader transition into SDRs—which has been possible since 1969—entails a willingness on the part of the international community to expand their use, which has been lacking. It also means that the IMF quotas governing the distribution of liquidity would have to be altered to create a more functional and equitable formula for SDR allocations.[61] Nor does the IMF presently have the authority, supervision, and independence necessary to function as a global central bank.

A second reason that SDRs may not be a viable alternative to US dollars as the global reserve currency is that SDRs can be held as reserves only by central banks and governments, which means that individuals and companies cannot use them, either in local or global trade. And since the average person could not borrow or spend in SDRs, they would not be an attractive source of liquidity for private markets, banks, and investors. SDRs are simply an accounting unit. While they may be a valuable currency for interbank and intergovernmental exchange trading, SDRs could never become a fully realized global currency since they function mainly as a store of value—not as a medium of exchange.

A third problem is the challenge of China. The yuan does not fully operate as a reserve currency since it is not freely convertible by other central banks that would use it to intervene in foreign exchange markets. Bringing China into the process of creating an equitable monetary system remains problematic.[62]

---

[59] Brandt Commission (1980, p. 209)

[60] The SDR is the weighted sum of these four currencies, valued in US dollars. Since the exchange rates of these currencies fluctuate, the value of the SDR is recalculated daily.

[61] Under current rules, 85% of IMF members must agree to an expansion of SDRs—a challenging threshold for official approval.

A fourth problem is the United States. America has resisted the expansion of SDRs from the time they were created. It's easy to see why. The widespread adoption of SDRs represents a threat to US dollar hegemony.[63] The US literally has a "vested interest" in not allowing an expansion of SDRs (or any other international reserve currency) to take away its privilege of trading in the same currency that it prints.

"The present reserve system is unsatisfactory," the Brandt Report declared in 1980. "Expansion of world liquidity is erratic in both its volume and its distribution."[64] Yet little has been done to correct these problems, and the monetary imbalances resulting from the superbubble have continued to build. Now, three decades later, there is an emerging consensus that the present system, under which the dollar acts as the world's reserve currency, should be subject to a thorough review and that new mechanisms must be established for creating and distributing an international currency to clear and settle outstanding balances between the central banks. Yet it is by no means obvious how to replace the dollar with a new global reserve currency. If the dollar is abandoned and there is no effective substitute for an international payments mechanism, nations may resort to settling their payments on a bilateral basis using their own currencies, as Brazil and China have announced they would do—which is hardly a stable or permanent solution.

---

[62] Through its massive purchases of US Treasury bonds, China has already demonstrated that it is interested in taking part in the global monetary system as an active player. But China may also be driving a hard bargain toward the creation of a new monetary system. Although it's still too early for China to play its hand, China's bargaining position is improving daily. If discussions to restructure the international monetary system were to begin during a time of monetary crisis rather than in advance of such a crisis, China could be in a position to emerge as a monetary hegemon. China has been buying a large amount of world gold supplies, leading some analysts to believe that China is emulating the same path that the United States did in the 1930s, when it purchased the majority of the world's gold and subsequently displaced Great Britain as the world's monetary guarantor at the global monetary conference of 1944. Its official rhetoric to the contrary, China must certainly see that appreciating the value of the yuan would help to correct world trade imbalances, and also that many nations—in the East and the West—are eagerly waiting for this to happen. If China promised to abandon its exchange rate to the dollar to alleviate international imbalances, while holding a majority of world gold supplies and making the yuan fully convertible into other currencies, it could attempt to broker an international deal to emerge as the world's currency guarantor. However, many in the international community do not see this as a desirable outcome, since there is a general sense that whatever currency replaces the dollar, it must not be controlled by a single country. In addition, there are many analysts who do not believe that the world will ever return to a gold standard (assuming that this is what China has in mind), or, for that matter, to any reserve standard that is based on a single commodity. The question is, does China intend to make the yuan a reserve currency? It's very likely. One possibility would be to issue its own bonds denominated in SDRs, which would enable China to foster a new market for a global reserve currency based on SDR liquidity. Another alternative is for China to slowly develop financial and trading markets for the yuan, gradually transforming it into a reserve currency. While it's probable that China will eventually create a reserve currency in one form or another, the challenge will be to transform its opaque financial infrastructure into deep and open domestic financial markets and banking institutions through greater transparency, supervision and regulation.

[63] The SDR was originally created to function alongside the US dollar in order to expand global liquidity when needed, although this possibility has never really been tested since the volume of SDRs has been limited. Some economists still believe that the US dollar could continue to operate as the world currency guarantor in parallel with expanded allocations of SDRs through the present IMF currency basket (of dollars, euros, yen and pound sterling), although this arrangement could have its own set of problems. Since the dollar is already one of the four currencies in the basket, when it receives dollars the IMF would have to decide to sell them and depress their value, or hold them and risk dollar depreciation. This could lead to a situation in which IMF liabilities were comprised of the four currencies, while IMF assets were primarily in dollars, exposing the IMF to dollar depreciation.

[64] Brandt Commission (1980, p. 209)

An integrated international financial system requires an integrated monetary reserve system. Whatever new currency system is chosen, it should promote the non-inflationary expansion of liquidity and also assist the adjustment process of the monetary system by ensuring that surplus and deficit countries have a similar obligation to adjust.[65] Surplus countries that don't need additional reserves must be able to direct their allocations to deficit nations which bear high adjustment burdens. A reciprocal adjustment process of this sort would transform the fatal flaw of the Bretton Woods system. But for that to happen, a new monetary architecture is required.

Looking Ahead

The Superbubble and the Dollar Crisis

Since 1944, America has been at the center of the world's financial system. For over sixty years, most central banks have held the bulk of their foreign exchange reserves in dollars.[66] Because of foreign investors' faith in the US economy and their seemingly unlimited desire to hold American dollars and bonds as a store of value, US government bonds have supported the value of the dollar, held domestic interest rates to a minimum, and allowed the US to finance its debt cheaply. By importing more than it exports, the United States sends its dollars to foreigners, who return them back to the US through the purchase of stock, bonds, companies, factories, and land. For many years, $2 bn of global capital has flowed into the US each day from global investors seeking safety and stability, good deals, competitive returns, and high growth rates. By relying on foreigners to supply its finance, America has been able to run a huge balance of payments deficit and spend without regard for its debts. The more that foreigners have been willing to invest their dollars in US assets, the more that the US has been able to import cheap products, hold down inflation, enable consumers to keep buying, and fuel worldwide economic growth.

---

[65] It's not certain how international discussions on a new currency will progress. Some analysts are proposing a G4 currency basket, comprised of the dollar, the euro, the yen, and perhaps the yuan. The G4 could also take another form, in which these same currencies are not placed in a basket but still share reserve status as independent currencies. Either way, a G4 reserve system is probably not enough to produce the deep changes in the monetary system that are now required. It's unclear how a multiple currency system would eliminate the superbubble, bridge the imbalances between surplus and deficit nations, and provide for a smoother, more stable and equitable adjustment process. My view is that a multiple currency system would be only an interim solution until the world community is fully prepared to undertake a full-scale monetary adjustment through an integrated currency or currency basket.

[66] The notable exception is the Cold War period, 1947-1991, when the Soviet bloc operated its own economic exchange system, the Council for Mutual Economic Assistance (COMECON).

If any other country were to institutionalize its deficit spending as the US has done, the IMF would insist on structural adjustment measures, including government austerity or currency devaluation. Yet because of the dollar's reserve status, the US has been able to avoid balance of payments problems by purchasing imports in its own currency. Even as far back as the late 1960s, French President Charles de Gaulle was commenting on the unfair advantage held by the United States. The US, he said, was using its position of reserve currency guarantor as a license to print money and finance its debt. As the Brandt Commission recalled, "Since the balance of payments deficits of the United States had become the principal source of growth in world liquidity ... it seemed to have, in General de Gaulle's words, the 'exorbitant privilege' of continuing to finance its deficits through the provision of still more dollars."[67]

Prior to this, when the US was running current account surpluses, the Bretton Woods nations had experienced little monetary volatility. America emerged from the Second World War with the world's largest current account surplus and the global monetary system had been fairly stable until the US current account began to slump in the 1960s. When the US ran a negative current account balance in 1971, it was forced to end the gold backing of the dollar. With this deregulation of the international monetary system, the issuance of credit exploded, and the United States, as issuer of the world's reserve currency, was its epicenter. The proliferation of credit resulted in a "hollowing out" of US industrial infrastructure. As manufacturing jobs left for overseas markets, the US gradually lost the basis of real economic growth. Consumption was now financed by credit, which had a profound impact on America's current account balance. By 2009, America's current account deficit was approaching $800 bn, by far the largest in the world.[68]

Given the risks of this huge deficit, why are private foreign investors and central banks still investing heavily in the US? Some investors argue that the reserve status of the dollar will continue indefinitely because it is not affected by the US deficit. The dollar is highly liquid and convertible in both current and capital accounts, and nearly 2/3 of all foreign exchange holdings are in dollars. Since the predominance of world trade, finance, and foreign debt is also in dollars, creating a new currency system would be pointless and enormously disruptive. There is the feeling that, in spite of the recession, demand by overseas investors and central banks will remain steady, foreign investors will continue to look to the US for security, and the global economic system will remain strong. Because of its size, wealth, legal, and political stability—not to mention its highly credible track record for repayment on loans—many believe that there is no reason to fear a monetary meltdown in the US. Since the United States can simply print more money, foreign bond investors are certain they will be paid. While many investors acknowledge the risk, they do not believe that US politicians would let their deficits become uncontrollable. And indeed, the share of US bonds sold at auction has continued to grow.

---

[67] Brandt Commission (1980, p. 204). Some analysts have attributed the term "exorbitant privilege" to Valery Giscard d'Estaing, who was Minister of Finance under de Gaulle.

[68] Index Mundi (2009)

Yet even as the dollar continues to be accepted, the prospect of such a large and persistent deficit presents risks to global financial markets and the global economy. US external debt rose to $3.5 trillion last year and is projected to increase by $1 trillion each year for the next decade. Larger US deficits and higher interest rates are already increasing the global competition for savings and raising serious doubts about America's capacity to repay its debts. Where is the US Treasury going to borrow this money? Given the rapid pace at which the US is taking on debt, how likely is it that China and other nations—with their own deficits to finance—will continue to underwrite half of the US debt for the next decade as they have in recent years?

If foreigners begin to question buying debts and other investments in the US, America may have to raise interest rates to sustain investment. But with high interest rates, foreign demand for dollar-based assets could slow dramatically. And if foreign investors were to stop funding the US current account deficit, the dollar would rapidly depreciate in value. This would require a further increase in interest rates, which would accelerate government debt, make imports and foreign debts more expensive, and severely impact the American economy.

When the value of the dollar was strong, the US economy attracted investment in spite of the US current account deficit. But without long-term fiscal prudence, international investors have started to ask whether the US can continue to maintain its reserve currency status by engineering low inflation without having to ratchet up interests rates to sustain capital flows. Ultimately, a dollar is just a piece of paper that has value because the government that issues it claims it does and the people who use it believe in it. But the institutions of the US government have been undermining that faith through careless fiscal policy. Now that the dollar is weakening, how long will foreign creditors allow the US to keep running the printing press for the world's currency before demanding that the US obey the same rules of fiscal responsibility that apply to other countries?

As a result of the Great Recession, public deficits have increased dramatically in many countries. As private credit stagnated, governments were called upon to issue credit and restore the purchasing power that was lost. G20 governments took on the role of spender-of-last-resort, sinking $17 trillion dollars into bailouts and fiscal stimulus to restore banks and financial institutions, which has sharply escalated the public debt. Soaring government debt may be typical during periods of war, but this recent spate of borrowing represents the largest public debt ever recorded in peacetime. Here's the problem: even though state spending is underwriting private liabilities, these stimulus packages do not substitute for real income growth in nations such as the United States, where huge numbers of high-value production and jobs have already been exported.

In the US, stimulus spending has weakened the dollar, raised the possibility of inflation, and increased government debt to alarming levels.[69] In the past few years, debt burdens in several other countries—notably Greece, Portugal, Iceland, Ireland, United Kingdom, France, Spain, Japan and India—have also reached 80% or more of GDP, raising questions about the sustainability of their public debts and economic growth.[70] But the persistence of the debt-to-GDP ratio in the US is particularly challenging: US government debts are projected to grow faster than its economy for at least the next decade.[71] If the US maintains these huge fiscal deficits, government expenditure will be diverted from domestic public services and investments, and sent abroad in interest payments on America's surging debt. During the recession, Americans realized that they could no longer take on new debt and personal spending slowed. Yet even if individual Americans continue to increase their savings and use it to pay down their existing debt, it will take at least a decade for US households to reduce their debt/income ratios to safe levels and balance the family budget.

---

[69] Mackenzie and Tett (2010). In early 2010, Moody's Investors Service, which rates the sovereign debt of nations, warned that the US triple A sovereign credit rating could soon be in jeopardy because of sluggish US economic growth and weak action in tackling the US budget deficit.

The specter of sovereign debt is already haunting bond markets. Because they are denominated in dollars, even when bonds are rolled over into new debt they will never be fully repaid. This means that when the next recession arrives, the US may be unable to borrow the vast sums needed to cover their outstanding debts. And this puts the United States in a colossal bind. On the one hand, reducing its debt will slow economic growth. On the other hand, sustaining huge deficits by borrowing from abroad to maintain consumption and deficit spending at home will lead ultimately to bankruptcy or extreme currency devaluation.

Mounting government debt will likely trigger the next financial crisis, which would immediately impact the value of the dollar. And a US monetary crash would quickly become global in scope, since sovereign default entails a crisis in the reserve status of the dollar. At the global level, this would deeply impact other nations with current account imbalances and soaring government debt, placing the entire balance of payments system in jeopardy. It also means that the massive adjustment in exchange rates and current accounts—when it inevitably arrives—will be that much more severe.

So how will we unwind the superbubble? Do the US, G7, G20, central banks and the world's financial institutions intend to create a new economic system before the present one collapses? Or will they leave it up to the marketplace and risk massive financial disaster? In the near-term, the burden of decision rests with the US. It has two choices, neither of which is very enticing. America can either make the tough choice to devalue its dollar—or dither around politically (as it has been doing) and suffer a default. At worst, default could mean debt repudiation; at best, it could involve the restructuring of the terms of loans and interest rates. There is no happy option. The Chinese have a compelling proverb for such a dilemma: "Drinking poisonous liquid to quench thirst."[72]

Toward a Global Monetary Conference

Why did the Brandt Commission call for an international monetary conference? Is this still necessary? Are there any indications of it happening soon? First, let's briefly review how we got to this point.

---

[70] The Economist (2010)

[71] Mankiw (2010)

[72] Qiao (2009)

There is a major flaw in global economic policy, a structural error built into the design of the Bretton Woods monetary system. Although free market ideology has obscured the problem from policymakers and analysts, it has never disappeared. This blind spot has not allowed us to see the period of relatively tame inflation from 1982-2007 for what it clearly was: a series of financial bubbles generated by policies geared toward an overcapacity of production. Our inability to reckon with this emerging superbubble has not allowed us to recognize its deeper structural roots; nor have policymakers and analysts fully realized that the tremors now shaking the pillars of the modern economic establishment are emanating from the long-term suppression of global demand.

Bretton Woods I ended in 1971 when the United States "closed the gold window," ending the link between the world's currencies and gold. In the absence of a monetary anchor, exchange rates have been left to float, leading to excessive credit expansion. Under Bretton Woods II (1971-today), the dollar standard has flooded the world with cheap money at a rate faster than the growth of world GDP, and successive bubbles have spread economic instability across the globe. The Latin American and African debt crises of the 1970s and 80s were followed by the Southeast Asian debt crisis of the 1990s. Each of these crises, and many others of lesser magnitude, were caused by a flood of dollars into developing regions from abroad, which overheated their economies and caused them to crash.

In spite of the obvious imbalances resulting from easy credit and high asset prices, central banks have pursued a policy of inflation-targeting rather than using monetary policy to curb rapidly rising asset prices. Efficient market theory—the idea that all participants in the market receive and act on all relevant information when it becomes available—has provided the rationale for these policies. From the perspective of developed nations, these theories seem to have worked. But the period of the Great Moderation, which was characterized by easy credit, low price-inflation, and steady growth, masked the symptoms of the superbubble which was forming within the global monetary and financial infrastructure. In setting interest rates between the extremes of high prices and recession, and ignoring the actual value of money and credit in the process, central banks have typically ignored the signs of asset bubbles until they burst, resulting in financial instability.

It's one thing to simply say that higher savings in deficit countries and stronger demand in surplus countries will alleviate global imbalances—the reality is far more complicated. Modern states are driven by a global economic machine which runs on only two gears. A nation can create the structural capacity to produce tradable goods and services and generate credit, or, lacking this structural capacity, it can attempt to obtain credit by relying on other nations which primarily produce and trade. A system where credit growth generates economic growth inevitably creates overcapacity, suppresses consumer wages and demand, and allows financial bubbles to build. Market forces do not adjust these structural imbalances. As Milton Friedman observed, "Inflation is always and everywhere a monetary phenomenon."[73]

---

[73] Friedman and Schwartz (1963). It's telling that many free market economists, who are otherwise disciples of Milton Friedman, have disregarded the master's famous maxim. Mainstream policymakers and analysts continue to treat money as though it is a function of the marketplace.

The need for policy change has become evident as a result of the world's economic integration during the past few decades. As financial markets became increasingly interdependent, international investors have, in effect, been setting asset prices on the basis of global monetary conditions. When asset bubbles are actually driving monetary policy, it's pretty clear that the tail is wagging the dog. These dynamics must be reversed. Transparency and discipline must be restored. When asset prices rise and cause economic imbalances, even when inflation seems to be under control, monetary policy should be tightened. Central banks should increase short-term interest rates when there are clear signs of financial imbalances. The world needs a monetary regulator to anticipate excessive risk-taking and reinstate a firm link between monetary and credit growth on the one hand, and price and asset inflation on the other. This is necessary to ensure stability both in single countries and throughout the entire international economic system.[74]

Without such management, the asymmetric policies of the present international monetary system will continue to encourage surplus and deficit nations to assume different roles and responsibilities. Since many deficit nations lack the structural capacity to produce tradable goods and services, international institutions can put heavy pressure on them to revalue their currencies. Yet there is no corresponding international machinery to prevent nations such as Korea, Taiwan, Thailand, and China from keeping their currencies undervalued, running trade surpluses and accumulating foreign exchange, and putting this wealth into "investment funds" which are seldom economically invested.

The superbubble underlying these conditions is a result of the imperatives that the world economic system has bestowed upon deficit and surplus nations. Under the terms of the Bretton Woods agreement, *the IMF has the legal powers to ensure that deficit nations adjust their fiscal balances and pay their debts, but has no such ability to ensure that surplus nations accept responsibility for facilitating their own adjustment process and recycle their accumulated financial assets in an equitable and stable way.*[75] The IMF is unable to link global capacity with global demand. Instead, the global economy must depend on deficit nations to sustain their global demand for the surplus output of the rest of the world. It is evident that the world cannot continue to absorb the excess supply of surplus countries without ensuring greater effective demand.

The recession of 2007-09 demonstrated the weaknesses of the global financial system and the assumptions on which it was built. The dollar has been the dominant reserve currency for more than sixty years, during which period America went from being the largest surplus to the largest deficit nation in the world. With the US now mired in an enormous deficit, the dollar's role as the strategic reserve currency is in question. It is apparent that the solution will have to be much more than the world's central banks supporting the dollar through coordinated interventions in foreign exchange markets.

---

[74] Traditional definitions of the monetary system also need to be expanded to include recent generations of ever-complex instruments and non-bank entities that impact monetary decision-making.

[75] Phillips (2007). Officially, the IMF is charged with "exchange rate surveillance," but in practice it is allowed only to publicly identify countries that it believes are unfairly manipulating their currencies for competitive advantage. Thus, the IMF may have embarrassment powers, but it has no enforcement powers requiring violators to alter their currency policies.

The increasing interdependence of the global economy requires international policy coordination, but national interests are still determining international politics. Each national government discusses how a particular global policy will affect its own financial competitiveness and stakes out its position. Then, through the world's different clubs—the UN, EU, G8 or G20—national representatives meet, discuss this policy, create a joint statement, and call it "policy coordination," "international coherence," or "regulatory harmonization." At these meetings and in the press, world leaders agree on the need for global coordination but rarely commit to binding action and essentially do what they want when they return home.[76] Greater global political cohesion is necessary before a new global monetary system can be launched.[77] It is critical that surplus and deficit nations coordinate their policies—but as long as they are pursuing their own self-interests, they will not be able to address the world's monetary and financial imbalances.

Even thirty years ago, the Brandt Commission was cautioning that the Bretton Woods system was designed for a different era. "The Bretton Woods international monetary system reflected the economic and political relations of the time. Since then much has changed—and the new system should reflect the changing political and economic circumstances of nations. The new international monetary system should have a pluralistic basis, in which no single political entity or small group of entities plays a predominant role."[78]... "We would like to see a more systematic and fully multilateral approach to countries in critical financial situations, rather than present ad hoc arrangements. This could include evolution of the IMF in the direction of carrying out some of the functions of an international central bank. For these and many other reasons, we welcome the many voices now added to our own calling for a review of the Bretton Woods institutions. We believe this should be an authoritative, international review which should lead to an international conference on their reform."[79]

On the agenda of a new monetary conference should be the creation of a stable global currency and an international central bank that has the ability to manage that currency and also to monitor the fiscal solidity of member states. To this end, the Brandt Report called for an expanded decision-making process on international monetary policy. It declared that "a broad-based leadership should be established to manage the international monetary system, including provision for a growing role of the developing countries in the decision-making process. Such a collective leadership can be established if there are clear, fair, and explicit rules for managing the system—rules which will protect the interests of all members of the system including the weaker ones. Such rules must ensure that the Fund is not wholly administered on the basis of shareholding."[80]

---

[76] The world witnessed a recent example of globally influential decisions by individual nations that were not taken as part of a coordinated international policy. In 2008-09, politicians from the G20 nations created stimulus packages worth $17 trillion geared for their own domestic constituents, while claiming that they were coordinating their efforts to address the imbalances in the global economy.

[77] The sovereign debt crises in the European Monetary System in 2010 are prime examples of why a certain degree of political union should precede monetary union. Europe has been pursuing the opposite course since it created the EMS in 1979: political cohesion has lagged behind monetary cohesion.

[78] Brandt Commission (1980, p. 218)

[79] Brandt Commission (1983, p. 95)

[80] Brandt Commission (1980, p. 218)

For the first time since the Brandt Report was published, there are indications of a trend in this direction. China, South Korea, India, Brazil, Mexico, and Turkey have been given small gains in voting power at the IMF, joining the G7 powers in decision-making roles.[81] Mervyn King, governor of the Bank of England, has proposed that the G20 become, in effect, a governing council of the IMF to help balance world growth and align global exchange rates.[82] French President Nicholas Sarkozy, who has been calling for a new monetary system, will be assuming the presidency of the G20 in 2011 and promises to open up the debate on the structure of a new Bretton Woods economic system.[83] A Financial Stability Forum has been created to help promote a new global regulatory regime.[84] China, Russia, Brazil, India, and other developing nations have also been calling for a new global reserve currency and monetary system.

The Brandt Commission proposed an international conference to discuss a new global monetary system. Thirty years later, it's no longer a question of if, but *when*. But what kind of monetary system is needed for the global political community now emerging and how will its responsibility be shared? Who is going to initiate this intergovernmental coordination? What changes in the balance of power will be required to represent the world's rich and poor economies in global economic decision-making? None of this is clear. What is clear is that the international monetary system is in chronic disequilibrium and needs to be readjusted through international collective action. The next round of currency volatility will very likely result in the collapse of the dollar, which will surely test its status as the world's reserve currency. If there is no effective system to replace it, the world could face a prolonged state of economic and political instability.[85]

Willy Brandt and his panel sounded the same note of caution in their report three decades ago. "The international community has made little headway in tackling its most serious problems—which begin in the strained system of international economic relations and result in additional burdens on many developing countries. Prospects for the future are alarming. Increased global uncertainties have reduced expectations of economic growth even more, and the problem of managing the international imbalances of payments is increasing the threat of grave crises in international finance. We have serious doubts as to whether the existing world machinery can cope with these imbalances and the management of world liquidity."[86]

Yesterday's financial crisis is quickly becoming today's government debt crisis and tomorrow's international monetary crisis. A generation from now, we may all be astounded by the naive ideology and complacency which led us to think that these enormous global monetary and financial imbalances were natural and that markets could somehow adjust them. Even in 1980, the Brandt Commission was calling attention to the fact that international production was outpacing the creation of a mass global market, and that this overcapacity in excess of human needs (expressed through effective demand at prevailing wages) was creating major structural imbalances and inequities. *While the adjustment mechanism of the IMF system requires deficit nations to make timely payments on their loans, Brandt insisted, surplus countries are not under any similar international obligation because there is no adjustment mechanism for recycling their trade surpluses and currency reserves.* A new global economic and legal framework is needed by which surplus nations are obliged to reduce tariffs, invest overseas, and revalue their currencies to increase demand for the exports of deficit countries and spend their surpluses back into these nations.

---

[81] Weisman (2010)

[82] Norman (2010)

[83] Bennhold (2010)

[84] Stiglitz (2010)

[85] The world community needs to plan and implement the new monetary system in advance of a global economic crisis. Otherwise, as history teaches, predatory forces could precipitate the crisis in order to manage the process and restructure the broken pieces according to their own ends.

[86] Brandt Commission (1983, p. 2)

"Fundamentally," said Brandt, "we require a set of measures which are designed to sustain effective demand in the world and promote an expansion of world trade. Such measures will help to ensure that deflation, balance of payments difficulties and default on debt are not widespread ... and thus help to ease bottlenecks, to create jobs through low-cost labor-intensive industry and to create the necessary social and economic infrastructure. It should provide special benefits to the low-income countries and be linked with the structural changes we propose in the international financial system."[87]

Major changes in global economic institutions are needed to undertake this global rebalancing of demand and eliminate the superbubble in the global economic system. There must be a rules-based multilateral approach to adjustment which results in a greater redistribution of wealth, rather than the bilateral structural adjustment policies of the IMF which result in its maldistribution. *The Brandt Report was the first major international proposal to call for the management of world demand to generate economic output and employment through a global stimulus program for developing nations and a restructured global monetary system so that deficit nations could have access to global liquidity through an equitable, efficient, and stable process. This would require surplus nations to either revalue their currencies to increase domestic demand, or recycle some of their surpluses to increase growth in deficit countries.* The report also demonstrated how these policies would open up the means for the creation of automatic sources of international financing, reduce disparities in income, ensure adequate supplies of energy, and reverse environmental degradation.[88] These remain the same challenges today if we are to create a new global economic system and avoid a systemic collapse and long period of global stagnation or depression.

"We are convinced that the world community will have to be bold and imaginative in shaping that new order and it will have to be realistic in its endeavors," Brandt asserted. "Change is inevitable. The question is whether the world community will take deliberate and decisive steps to bring it about, or whether change will be forced upon us all through an unfolding of events over which the international community has little control. It is the joint responsibility of all countries and people to act without further delay.”[89]

---

[87] Brandt Commission (1980, pp. 240-241)

[88] There was neither time nor space in this article to deal with all of the Brandt Report's proposals for development, aid, trade, finance, alternative sources of finance, technology, energy, the environment, and the process of global negotiations. I've chosen to focus exclusively on the monetary dimensions of the Brandt Report because this guidance is needed now to support the changes necessary in these other important areas. Much more could be said on how a new monetary system would catalyze solutions across the entire range of sustainable development issues.

Toward the Development of More Robust Policy Models

Steven E. Wallis[1]

Abstract: The current state of the world suggests we have some difficulty in developing effective policy. This paper demonstrates two methods for the objective analysis of *logic models* within policy documents. By comparing policy models, we will be better able to compare policies and so determine which policy is best.

Our ability to develop effective policy is reflected across the social sciences where our ability to create effective theoretical models is being called into question. The broad scope of this issue suggests a source as deep as our unconscious ways of thinking. Specifically, our reliance on modern and postmodern thinking has limited our ability to develop more effective policy, and more particularly, logic models.

The move in some quarters toward “integral” thinking may provide insights that support the creation of more useful policy models. However, some versions of that thinking seem to be unwittingly mired in modern and postmodern thinking. This paper identifies how integral thought may be clarified, allowing us to advance beyond postmodern thinking. Usefully, this “neo-integral” form of thinking supports the creation of more mature policy models by encompassing greater complexity and a careful understanding of interrelationships that may be identified within the logic models that are commonly found in policy analyses.

Neo-integral thinking is related to more complex forms of systems thinking and both are found in recent conversations within the nascent field of metatheory. And, to some extent, a logic model within a policy operates as a kind of theoretical model because both may be used to inform understanding and decision-making. Therefore, it seems reasonable to apply neo-integral thinking and metatheoretical methodologies to conduct critical comparisons of logic models.

In the present paper, these methodologies are applied to critically compare two logic models. The structure of each model is analyzed to objectively determine its complexity and formal robustness. The complexity is determined by quantifying the concepts and connections within each model. The robustness of a model is a measure of its internal integrity, based on the ratio between the total number of aspects and the number of concatenated aspects. In this analysis, one policy model is found to have a robustness of 0.08, while another is found to have a robustness of 0.67. The more robust policy is expected to be much more effective in application. Implications for policy development and policy application are discussed.

---

[1] Steven E. Wallis, Ph.D., received his Ph.D. from Fielding Graduate University in 2006. He has a decade of experience as an organizational development consultant in Northern California and a broad range of interdisciplinary interests. He is the founding director of the Foundation for the Advancement of Social Theory. The goal of F.A.S.T. includes identifying objective paths for the validation of social theory, benchmarking the advancement of theory, and supporting the falsification and application of effective theory in social systems. Through this metatheoretical approach, Dr. Wallis is working to accelerate the advancement of the social sciences for the benefit of scholars and practitioners around the globe. SOME RIGHTS RESERVED

This approach will enable the more conscious advancement of policy through the development of improved logic models and it opens the door for more effective impact of such policies in a political context. From an integral perspective, this paper implies that we should avoid engaging in loosely defined integral thinking that lead to pronouncements about what people "should" do. Instead, this paper shows how to apply a more precise and objective form of neo-integral thinking to empower individuals and organizations to accomplish their most noble goals.

Keywords: Drug use, logic model, metapolicy, metatheory, neo-integral, policy, robustness, Scottish Parliament, theory of theory

Thus traditional political theories, just like current strategic games, gravely overvalue the pacificatory role of rational knowledge: this miscalculation constitutes the self-publicity of these disciplines. Reason always lurks around proportion and dominance.

Michel Serres in "The Troubadour of Knowledge" (1997, p. 135)

Introduction

In his well-known critique of the modern policy process, Sabatier (1999) calls for better theories to improve the process of policy creation. This paper answers that call by providing new insights into the evaluation of *logic models*. A logic model is common in many policy documents and serves as a concise, diagrammatic representation of the policy, how it will be implemented, and how the results of that program will be measured. In the policy literature, discussions on the logic model commonly include suggestions on how the model might be analyzed by stakeholders, politicians, and experts. The literature does not provide any advice on how to evaluate such models in any objective way.

That gap in the policy literature is addressed here by introducing new methodologies from the field of metatheoretical analysis. Using these methods to compare and improve policy models is expected to engender significant advances in the field of policy analysis. Public policy is political, by definition. Because public policy at all scales has direct impacts and structural influences at all scales of politics and the political, the development of more robust policy contributes to the development of politics and the political, the theme of this special issue.

In this paper, I note the ongoing controversy in the field of policy, and how that controversy relates to the failure to construct effective policy. Next, I identify the logic model as an overlooked lynchpin of the development of policy. I indicate how the logic model shares important conceptual similarities with social theory. Then, I discuss recent innovations in the field of social theory validation and identify how those new techniques are applied to the analysis of a logic model. Finally, I apply those methods to two logic models to identify which model is more likely to result in more effective results.

Effective Policy?

There is an ongoing concern about the effectiveness of policy and the related theory. The US Congress began to take an interest in program evaluation in the early sixties. However, by the late seventies, “Program evaluation has not led to successful policies or programs” (Schmidt, Scanlon, & Bell, 1979, p. 1). It is reasonable to assume that our failure to evaluate or improve our policies relates directly to our ability to understand them – despite the continued efforts of brilliant scholars in the field of policy.

In a review of the current state of public policy theory, John (2003) pays tribute to the classic works of policy (including models developed by Baumgartner, Jones, Kingdon, Sabatier, and Jenkins-Smith) and speculatively asks if “this particular kind of thinking about public policy has come to the end of its line of development” (John, 2003, p. 482). John notes in this discussion that the central debates in public policy theory are still along the lines of the above authors.

So, despite the diligent work of brilliant scholars, our ability to understand and improve policy does not seem to be improving. By the end of the 20th Century, we were still calling for better theory so that we can better understand policy so that we may develop more effective policy (Sabatier, 1999). And, at the start of the 21st Century, the state of world affairs suggests that we still do not have a more effective way to make policy. Even deLeon (1999), who criticizes Sabatier’s work, agrees that our present understandings of policy suffer from weaknesses, including the “lack of predictive capabilities” (deLeon, 1999, p. 26).

DeLeon (1999) suggests that a systems approach might be a useful way to better understand policy. Thus, it appears that “the time is ripe for a systematic evaluation of our metatheoretical assumptions” (Lamborn, 1997, p. 212). Or, more plainly, we need to develop a better understanding of how we develop policy if we are to develop better policy. And, while the present paper does not presume to complete Lamborn’s entire task, it answers his call at least in part by providing a new, systems-based, metatheoretical approach to the analysis of logic models.

Policy and Program Evaluation

Policy and program evaluation are important for developing successful programs for achieving goals and alleviating social ills. Broadly, some approaches to policy analysis might be considered “metapolicy.” That term has been used to refer to a “policy about policies” (Kerr, 1976, p. 351), or an explanation of the social context within which policy is developed, for example, Jacobs’ (1995) description of the differences in policy-making between Canadian and American health care systems. It has also been used to describe policy analysis that results from the collaboration of various groups, such as members of the public, and/or other combinations of experts, scholars, and laypersons (Walters, Aydelotte, & Miller, 2000). Finally, metapolicy has been used to refer to “policy networks” (Detomasi, 2007, p. 321) representing a network of policy stakeholders, or a “structure” of policy problems (Hoppe, 2002).

Within the general area of metapolicy, we have policy analysis. A brief, yet useful, overview of policy analysis is provided by Dror (1970) who lists five issues: (a) The basic modus operandi of policy making systems; (b) Main components of policy making (organizations and personnel); (c) Information inputs into policy making; (d) Main policy making methods (techniques of analysis); (e) Main megapolicies (what to analyze, operational goals, degrees of innovation, level of risk, time preferences). A similar list is presented for policy-like process of "social design" suggests that designers consider: (a) Bounded rationality; (b) Data for planning; (c) Identifying the client; (d) Organizations in social design; (e) Time and space horizons; (f) Designing without final goals (Simon, 1996, p. 166).

The difficulty of policy analysis might be based on the complexity of policy creation. The process of creating a policy is inherently messy. The garbage can model was commonly applied to understand this process until it was superseded by Kingdon's model of multiple streams that reveal a window of opportunity (Kingdon, 1997).

In this section, I have provided a brief overview of policy creation and analysis. It should be noted that these approaches investigate policy as a whole. However, this approach does not seem to have led to the creation of better theory of policy or better policy. Therefore, in the present paper I investigate a "micro" approach, with a close focus on the logic model.

Logic Model

The many streams of problem emergence, political wangling, and policy analysis result in the creation of a policy document – an explicit written report that presents the shared understanding of what the problem is and how it might be addressed within a limited window of opportunity (Kingdon, 1997). Within this policy document, the logic model serves as a lynchpin by clearly and explicitly identifying how the research, analysis, actors, and anticipated results may be measured to test the efficacy of the policy.

According to McLaughlin & Jordan (1999), There are several ways to present the logic model; although, it is usually presented as a diagram with inputs and resources on the left, connected by one-way arrows to major activities in the middle and one-way arrows to expected outcomes on the right. This diagrammatic representation provides, "a picture of how something works as they provide a link to outcomes (both short – and long-term) from program variables and processes" (Bruder et al., 2005, p. 187, citing the W. K. Kellogg Foundation). "Evaluators have found the logic model process useful for at least twenty years" (McLaughlin & Jordan, 1999, p. 66). A typical example is presented in figure 1.

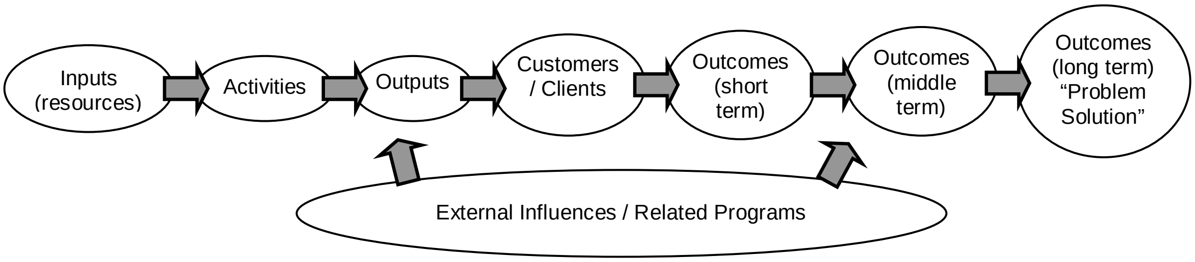

Figure 1. Example of Logic Model – derived from (McLaughlin & Jordan, 1999, p. 67)

As widely as it is used, the logic model has also been criticized recently on a number of fronts. First, despite the logical appearance of this model, “it still only represents stakeholders’ best guess or theory for what will be most effective” (Hernandez & Hodges, 2001, p. 10). Although “best guess” might sound a little harsh, such a level of understanding seems commensurate with the level of success we have found with the implementation of policies and programs. Indeed, the rule of practice appears to be, “If it looks reasonably logical, it is an acceptable model.”

This, however, should be seen as a weak standard. It is like preparing to buy a car and asking the salesperson, “Does this car have good batteries?” The answer is always “yes.” The better question would be “How many miles will I get on a single charge of these batteries?” That is the state of our policy analysis process. Certainly a logic model will be analyzed and (at some point in the process) approved as being a “good” model. A more useful question would be, “How good is it?”

Another important criticism of logic models is put forward by Sabatier (1999) in his call for better theories of public policy making. Instead of a neat linear series of boxes, the policy process involves hundreds of actors, specialized scientific and technical knowledge, over many years of time, with each participant attempting to push a different “spin” on the process (Sabatier, 1999, p. 4). The complexity hidden within the apparent simplicity is noted by McLaughlin and Jordan who state:

> Although the example shows one-to-one relationships among program elements, this is not always the case. It may be that one output leads to one or more different outcomes, all of which are of interest to stakeholders and are part of describing the value of the program. (McLaughlin & Jordan, 1999, p. 69)

In seeking to improve the process of policy evaluation, many approaches have been suggested. These include quality control, more effective evaluator training and selection, higher standards and ethics, and encouraging more evaluation overall (Hatry, Newcomer, & Wholey, 1994). Unfortunately, “The criteria for comparing frameworks are not well developed” (Schlager, 1999, p. 252).

Importantly, if we cannot objectively compare policy models, we cannot effectively decide if one model is better than another. Instead, we are forced to resort to so-called common sense and political wrangling. And those are the techniques that got us here in the first place. Should we then throw out the logic model? Or, is there another possible approach?

I adopt the stance that the logic model is indeed a useful tool. However, it is a tool that has not been understood or applied to its full potential. We have not understood the logic model completely because the literature around the logic model has focused on the relationship between the model and the “real world,” rather than focusing at the logical relationships between the propositions within the model, itself.

Therefore, we have only understood half of the “equation.” This partial understanding is like trying to play the violin with one hand. We are able to make noise, but not much music.

Evaluating Logic Models

Rather than revisit the overall process (which has been more effectively explored by more qualified scholars than I), my approach in this paper will be to look at that “missing link” of the explicitly written policy document. Specifically, I will focus on the logic model that is a common part of most policy documents because that logic model is a critical lynch-pin of the entire policy – representing all of the research, the political relationships between the actors, their shared understanding of the situation, and a representation of their plan for improving the situation.

When most authors discuss the “logic” of the logic model, they are referring to the relationship between the model and the real world (through data collection, analysis, and program results). In contrast, the literature does not much address the logic inherent within the logic model, itself. My focus will be on that structure. As Figure 1 indicates, the logic model is an essentially linear representation. Typically, “the logic model is usually set forth as a diagram with columns and rows, with the abbreviated text put in a box and linkages shown with connecting one-way arrows” (McLaughlin & Jordan, 1999, p. 69). When examining such a model, an observer may be led to believe that the project will begin, move through a series of steps, and successfully reach the desired end state. In which case, the reader could easily assume that such a model appears reasonable or intuitively correct.

Yet, we must be cautious of common sense. Because what seems to make sense in the creation of a policy might not work so well in application. Such a situation arose recently when:

> The intuitive common sense of these policies – in the extent to which they promoted a “master plan” for Massachusetts’s public higher education – helped build the faith of policymakers in the system and its leadership. But it also helped to obscure the costs of the BHE agenda, and to make it difficult for those problems to be addressed in the future. (Bastedo, 2005, p. 38)

After all, if common sense were so effective, we might not have needed a formal analysis and policy in the first place. Everyone would have agreed on a course of action because it simply made sense. Or, the problem would have never arisen in the first place, because everyone would have used their common sense to choose actions that would not lead to such problems. Yet, the problems arise, and reasonable people disagree about the causes and solutions. Thus it seems common sense is not a sufficient tool for determining the logic (or potential effectiveness) or logic models.

On a slightly deeper level, McLaughlin and Jordan (1999) suggest checking the logic model as a set of hypotheses, logical statements, or propositions. However, they do not go much beyond this recommendation. So, the present paper represents and extension of their excellent work. Insights from other branches of social theory can also be applied to continue their line of inquiry. For example, Dubin (1978) suggests how increasing levels of structure within a theory will make a theory more effective. Wallis (2008a) provides an objective methodology for analyzing the structure of theories to advance them along this path.

This structural approach is of some importance based on recent developments in metatheoretical analysis. Specifically, it has been shown that the formal robustness of a theory is a good indicator of that theory's efficacy in application, and, further, that a theory must have a formal robustness of 1.0 before it can be considered revolutionary, in the Kuhnian sense (Wallis, 2009c). Thus, by advancing a theory (or, here, a logic model) towards higher robustness, scholars and practitioners will advance purposefully towards true paradigmatic revolution.

Thus, it seems reasonable to suggest that this method could be applied to effectively and objectively analyze a logic model within a policy to determine how effective that policy might prove in application. Such a method would be extremely useful for the evaluation of any policy and, more particularly, those policies that involve high levels of risk and expense – such as a policy for national health care.

Again, here I am not looking at the broad level of policy elements (actors, analysis, implementation, measurement) or the relationships among them. Instead, I take a micro-approach to address a gap in the literature – the analysis of the logic model, itself. In this, I will use the term "policy" to refer to the explicit report, or written policy – specifically as exemplified in the logic model, or model. First, I examine policy's related and underlying context, that of social theory.

Failure of Social Theory and the Failure of Policy

In parallel with the limitations of policy analysis, it has become increasingly clear that the social sciences do not provide effective tools for understanding or guiding human activity. This limitation is reflected in the spotty success of economics (Dubin, 1978, citing Rapoport), the failure of social change theory (Appelbaum, 1970; Boudon, 1986), high failure rates in the application of Total Quality Management (MacIntosh & MacLean, 1999), frequent failure of organization development culture change (M. E. Smith, 2003), failure of organizational theory (Burrell, 1997), and theories of bureaucracy (Bernier & Hafsi, 2007). As with the failure of other branches of social science, the inability to develop effective public policy models has left the promise of the social sciences "largely unfulfilled" (Spicer, 1998). The failure of policy should lead to a critical examination of how policy is created, structured, and applied.

This focus of study is especially important because the need for effective policy has not diminished. Today, "The complex and difficult global environment has overwhelmed, exasperated and saddened many observers" (Dennard, Richardson, & Morçöl, 2008, p. 17). For example, our current economic issues may be understood as resulting from a failure of policy. The lack of policy seems to have led politicians to enact a series of ad hoc interventions, where, instead, "the time has come to begin thinking about a systematic approach," according to House Financial Services Committee Chairman Barney Frank (Graham, 2008, p. 1). Similarly, the International monetary Fund (IMF) blames those failures on "policy shortcomings" (Wroughton & Kaiser, 2008).

The failure of policy is not the failure of any one group to achieve their goals (although that is a related issue). Rather, it appears to be a failure of all groups to understand the problem at hand – and render that understanding into a policy document with an attendant logic model that will be more likely to ensure their success. The biggest problem that we face is that we think we have the answer. We seek direct answers, forgetting how, "for every problem there is a solution which is simple, clean and wrong" (Menken, 2009, p. 1). The need for better policy, including budget restrictions and competing constituencies, propels agencies into a “metapolicy environment” where they, “… must consider policy making from several perspectives” (Boschken, 1994, p. 308).

Similar approaches to policy have been suggested in the study of complexity theory. For example, “triangulation” is suggested as a way to coordinate multiple methods of analysis (Roe, 1998). “Full spectrum analysis” suggests the need to carefully analyze a wide range of information (Mathieson, 2004). Complexity theory has also suggested other, more general, approaches (Elliott & Kiel, 1999); but they have not yet been proven effective. Whatever the process of policy analysis that process must result in the creation of some written policy. And, importantly for this paper, that explicitly written policy will have a logic model with a measurable structure.

Below, I will present an innovative understanding of integral thinking that seems useful for understanding the structure of logic models of policy. This neo-integral approach to developing more effective policy models does not espouse any specific goal outside of the structure of the model. In this analysis, I will draw on innovative metatheoretical methodologies that reflect neo-integral thinking to analyze two versions of policy drawn from efforts of the Scottish Parliament to reduce drug abuse.

Broadly, this investigation is a form of “design science,” or “policy science,” or “evaluation research” (Van de Ven, 2007, p. 278). Van de Ven suggests that an important difficulty in such research is essentially a question of politics, pose, and ethics. From an ethical stance, researchers should not impose their views on an organization. From a stance of politics and power, it remains an open question as to whose view should be used. As far as he goes, Van de Ven is quite correct; there is great benefit to be found through collaborative evaluations. However, there are more issues to consider.

In addition to the basic issues of investigative scholarship, there is Popper’s call to evaluate theory (and therefore, to some extent, policy) primarily through “falsification” (Popper, 2002). Briefly, Popper states that the test of proving that a theory is correct or works is insufficient. For example, a theory might claim that undetectable fairies make time move forward. Such a theory might be perfectly acceptable as an explanation for some individual. And, that person might claim to have proved the theory is true because time does appear to be moving forward (thus proving the existence of otherwise undetectable fairies).

However, there is no way to prove that theory is incorrect (in this example, there is no way to independently test for the existence of fairies). Further, and more importantly, if there is no test to challenge the theory, there is no way to improve the theory.

In contrast, Popper calls for theories that can be proven wrong. For an abstract example, consider a theory claiming that A and B must both be increasing to cause an increase in C. If an observer sees an increase in C with an increase in only A or B (or neither), that theory has been falsified. This kind of critical test encourages the theorist to develop a new and better theory – thus improving the science.

For policy, however, there is no way to determine its efficacy until after it has been applied. This, of course, is a very expensive proposition as global affairs (e.g., war in Iraq and world economic problems). Another difficulty is that a program that is perceived to be successful might not be successful. For example, a socio-economic "rain dance" might be perceived as successful, though there is actually no causal relationship between the dance and the subsequent changes.

Clearly, if we are to understand this issue, we will need a larger perspective. That perspective is a form of "metapolicy analysis." In the past, metapolicy has referred to a study of the source of policy, or the application of policy. One of the simplest, and perhaps the weakest form of policy analysis might be seen in a simple checklist; where a policy is evaluated to see if it meets the goals of an agency (FSAT, 2009). This approach is considered weak because it does not address the effectiveness or quality of the policy, itself (as reflected in the logic model) – only the relevance of the policy to the organization.

Seeking self-beneficial results is not unusual; indeed, "normally, policy evaluation consists of attempting to find indicators of either impact or the tangible deliverables and outputs of an initiative." (Ramsey & Bond, 2006, p. 1). However, such outputs are not available before the implementation of the policy. Hence, the need to understand policy from a metapolicy perspective to optimize a policy before its implementation.

Because this paper presents an innovative approach, some disambiguation is indicated. First, I use the term "metapolicy analysis" in reference to the study of a set of explicit policy documents, regardless of their formulation or application. Specifically, for the preset metapolicy analysis, I will focus specifically on the structure of the policy, as that structure is understood as the set of relationships between the causal propositions that are found within the logic model. As I will describe in the next section, this rigorous focus on interrelationships has evolved from our history of modern and postmodern thinking.

Structure of Logic Models

As noted in the introduction to this paper, the focus here is not on the grand whole of policy from creation through application. Rather, the focus here is on the explicit written policy – as exemplified in the logic model.

Given the benefits of human interaction (which results in direct and synergistic benefits), it seems reasonable to suggest that we might understand the propositions within a policy as having benefits from similar interrelationships. The main benefit is improved clarity of understanding for those using the model. By obtaining a better understanding of the complexity and interrelatedness of our policy models, we may expect to develop a better understanding of policy, in general.

A policy model is a mental model, a schema, a theory, or, more colloquially, a lens or point of view. The policy model acts as a computer program, metaphor, filter, or sense-making device.

Starting with all the available information, the data go into the model. The "output" is our understanding of the present situation. That understanding implies that we might be able to predict the future results of our actions (to the extent that anything is considered to be predictable).

For example, if a nation has a policy model that represents immigrants as invaders, that nation might take action to fight back against those immigrants, and act to ensure that future immigration is limited or eliminated. In contrast, holding a different lens of policy, a nation that sees immigrants as useful contributors to society would welcome immigrants with open arms. For each approach, there will be some outcomes that are somewhat predictable, and some results that are less so.

These lenses, or models, may be tacit (as in our unconscious assumptions), or they may be explicit (as in a diagram or flow-chart). Either way, these models serve to guide our decisions and impel us to action (or non-action). There are a few basic paths to describe how these models are created. One way is for them to be developed unconsciously, as in Argyris' "ladder of inference" (Senge, Kleiner, Roberts, Ross, & Smith, 1994). Yet, when those models remain tacit, we lose some opportunity for communication because tacit information is more difficult to communicate (Kakabadse, Kouzim, & Kakabadse, 2001).

Another way to develop a policy model is to follow the dictates of some authority. While, this kind of explicit direction is more easily communicated, it is not necessarily more accurate or more useful than a tacit mental model. Indeed, there are issues of conceptual colonization and domination (L. T. Smith, 1999). Another approach to developing a policy model is to consciously and critically analyze the available information. This process is seen in the development of academic theory – essentially, the process of scholarship.

More collaborative methods are also available. We may follow, for example, a collaborative process such as the Future Search process (Weisbord & Janoff, 2000). There, a facilitated process of collaboration and communication among at least some stakeholder combine to develop a mind map (which is essentially a shared mental model) that is more complete because it draws on more contributors; a reasonable approach because, "the public always knows more than any of the "experts" (Churchman, 1968, p. 232).

Comparing the dictatorial to the collaborative approaches, it should be noted that dictates (such as "do this" or "go there") are understood as relatively simple compared with a wall-sized mind map full of information (and potential contradictions). The more complex understandings found in a large mind-map seem to support the efforts of each individual as they find their own path and goal from a complex range of choices. In short, dictatorship is simple while free collaboration is complex. That is to say, a free person must face a multitude of complex choices, while a slave has those choices dictated.

While all these methods are used to create policy models, and some of those models are used to guide policy decision-making, there is no guide outside of application to determine whether one model might work more effectively than any other. In short, the literature has not deeply explored the "internal validity" of the decision making model; where that validity is separate from the actual application of the model. Of course, there is the tradition of academic validation. However, that approach is limited to the process of citing experts and logical arguments. As noted above, this level of internal validation does not seem to have been as effective in the creation of effective policy. In a reframing of Popper's "three worlds" of validity, Wallis (2008c) suggests that the social sciences are insufficiently developed to apply Popper's test of falsification through empirical testing.

This is an important concern, because policy creation, comparison, and change is often "hopelessly confusing" because of the clash of belief systems between the actors (Schlager, 1999, pp. 252-253). And, as a result, some may suggest that the best way to evaluate a Logical Model and the associated policy is to empirically measure the results of the program.

And, indeed, that is an ongoing trend in program evaluation (Hatry et al., 1994). However useful this is for existing programs, the empirical approach cannot be applied to the development and implementation of new policy and new programs. There is simply no way to evaluate the success of a program before it is implemented.

Instead of a single approach to evaluation, Wallis recommends multiple tests – a sort of triangulation – to examine the validity of the model through a combination of tests (internal validity of the structure, external testing in application, and the meaning it makes for the user).

Within the nascent field of metatheory, there are emerging views that may lead to more effective methods of validation. For example, a more effective model might be understood to be one that is more mature. In Growing *the Field: The Institutional, Theoretical, and Conceptual Maturation of 'Public Participation* Ross & Glock-Grueneich (2008) develop innovative and useful insights into the structure of theoretical models. They accomplish this by drawing a parallel between the less-understood development of models and the better-understood development of individuals, organizations, and cultures. In each area, the system that is understood as more evolved is the system that is more complex. In their maturation model of theory, based on hierarchical complexity theory (Commons, Trudeau, Stein, Richards, & Krause, 1998) the stages are:

1. Abstract Stage (stories become cases, events are abstracted to data).
2. Formal Stage (two or more Abstract Stage variables are related).
3. Systematic Stage (developing simple hypotheses from Formal Stage relationships).
4. Metasystematic Stage (creating models that account for all relevant relationships).

Importantly, in this maturation model, the systematic stage is one where there is a formal description of how variables interact in relation to one another. This stage requires "multiple input variables" and may suggest multiple outputs as well. This view stands in contrast to less complex (and so less mature) models that suggest simple, linear, causality. Creating a parallel between complexity and some sense of maturity seems to have validity – and is reflected across a broad section of literature.

For a few examples, the process of evolution (a continual process of variation and selection) leads to increasing complexity of our ecological and social environments (Holland, 1995) and the same insight applies to our economy (Friedman, 1997) where the creation of new products and the selection of the consumer leads to the generation of ever-increasingly complex selection of consumer goods. Indeed, we may adopt the perspective that "the inanimate world, life, and human existence are envisioned as systems of increasing complexity representing physical biological and sociopolitical realities" (Herrmann, 1998, p. ix). This, in turn, suggests that that individuals and organizations, existing in more complex interrelationships, are better able to detect and adapt to the complexities of the market in complex and creative ways (Stacey, 1996).

This idea might be broadly understood as, "More complex models are more effective." And, as such, this may appear to violate the so-called "rule" of parsimony – which suggests that the better theory is the one that is more concise. The general idea of parsimony dates back at least as far as Ockham's razor. However, investigations by Meehl (2002) suggest that the claim of parsimony for theory validity is over-used, misunderstood, and is of questionable validity.

Meehl suggests, "no ontological metaproof exists that the world must be 'simple,' or that 'simpler' theories are, as a class, more likely to be correct. The most impressive theories of mature sciences are hardly ever 'simple,' either conceptually or in the formalism" (Meehl, 1992, p. 423). For example, multiple theories (or multiple views) of an organization provide a richer, more useful understanding of that organization (Bolman & Deal, 1991; Edwards & Volkmann, 2008).

The maturity model might be seen as suggesting that a policy model that is relatively simple is one that is less mature; for example, if a policy states, "Our only goal is to make more money." The enactment of such an immature policy might be expected to cause many unanticipated and unpleasant consequences. A more mature structure of policy would have more aspects. For example, seeking benefits in three areas (e.g., financial, ecological, and human) would be more complex and so more mature than seeking fewer (e.g., only financial). A more mature policy would also identify more linkages between aspects, and those linkages would be better described. A useful tool would be the ability to identify "how mature" a policy might be. Such ability would allow stakeholders to easily identify which policy might be most effectively applied in a situation.

Similarly, theories containing a higher level of structure are also more efficient. The most highly structured theories, "expresses the rate of change in the values of one variable and the associated rate of change in the values of another variable" (Dubin, 1978, p. 110). Such an expression would necessarily be more complex than, for example, stating, "A is true."

Another tool for understanding the internal validation through an understanding of the structure of theory is found in Wallis (2008a) who presents a method for analyzing academic theories. Usefully, the method of propositional analysis provides an objective indicator of the internal integrity of the theory. Wallis describes this as a measure of the "robustness" of a theory and suggests that theories that are more "robust" (like those of physics and mathematics) will prove more effective in practice, while less robust theories (such as those commonly found in the social sciences) will prove less effective in practice (Wallis, 2009c).

My use of *robust* differs from other meanings. It does not mean, “insensitive to uncertainty about the future” (Lempert & Schlesinger, 2000, p. 391). Nor is robustness used in the more colloquial sense of “strong,” “widely scattered,” or “unchanging.” In short, robustness is a specific and objective measure of the relatedness between propositions within the theory.

In order to objectively determine the robustness of a theory, I suggested investigating relationships between the propositions of the theory to identify the co-causal connections between the propositions. Theories with connections that are more completely interrelated are held to be more effective. For example, a proposition such as, “A is true” would not be of much value because it is essentially an unsupported claim. A proposition such as “B is true because of C” or, similarly, “Changes in B cause changes in C” is more valid because there are more connections between the conceptual components (it is also more complex).

Readers with an interest in the advancement from modernity through postmodern ways of thinking may recognize the first proposition as atomistic/dualistic (because it suggests that A has an absolute value) and the second as contextual (because B has validity only in the context of C). The contextual proposition may also be understood as being linear because change in one is said to cause change in the other.

Adding more aspects to atomistic propositions does not enhance the validity of the theory; for example, “A is true, and B is true, and C is true” is likely to engender more arguments about the truth of each statement (instead of fewer arguments about the truth of fewer truth claims).

Similarly, adding more aspects to a proposition that is essentially contextual, or linear, does not add to the validity of the proposition. For example, “A causes B causes C” is a linear proposition where the aspect of B is redundant (Stinchcombe, 1987) and so adds nothing to the proposition. One might just as well say, “A causes C.” The validity of the aspect has not changed so much as its context has been altered like unpacking a series of nesting dolls.

Rather than these modern or postmodern approaches, it is more beneficial to develop propositions that contain more aspects *and* have the relationship between multiple aspects carefully explicated: for example, “Changes in A and B cause changes in C,” or to explain those changes more carefully, “More A and more B cause more C.” These kinds of propositions are *concatenated*. That is to say, there are multiple causes that are evidenced in the resultant effects (Kaplan, 1964; Van de Ven, 2007).

This perspective is in keeping with the idea that more complex theories are more mature and so are expected to “induce more sophisticated practice, data collection, analyses, model testing, and thus further research and model building” (Ross & Glock-Grueneich, 2008, p. 11). In contrast, a simpler theory (containing fewer aspects) means that its sensemaking ability will “catch” fewer areas of knowledge and understanding. Thus, as the theory sees less, it will miss more: “easily unperceived effects” (François, 2008).

Another way of understanding a concatenated relationship between ideas is to think of it as a kind of Hegelian dialectic (e.g. Appelbaum, 1988), where two aspects called thesis and antithesis can lead to the emergence (or change) of a third dimension called synthesis.

This is conceptually similar to the process developed by Bateson (1979), who describes "double description," where multiple streams of information are combined to suggest a new, third form, of information that is more useful than the previous two. Another example of double description is binocular vision (where the extra sense of depth is added). Bateson shows how these double descriptions create an extra dimension of understanding that is of a different logical type.

There is a parallel between the structure of Bateson's approach and the structure of theory. As described above, a concatenated aspect of theory is evident in a proposition describing how aspect A and aspect B combine to understand aspect C. This understanding of aspect C through the understanding of aspects A and B suggests a greater level of understanding that, in turn, may be used for more effective policy decision. These concatenated relationships add to the construct validity of the theory (or policy) (Van de Ven, 2007, p. 189).

According to Wallis (2009a), the method for determining the formal robustness of a model follows five simple steps:

1. Identify a specific body of theory
2. Search the literature for concise definitions
3. Identify causal propositions
4. Link casual propositions according to related concepts (where one aspect is influenced by two or more others)
5. Identify the total number of propositions and compare to the number of co-causal propositions (creating a ratio between zero and one).

For an abstract example, let us say we have a theory consisting of the following propositions: A is true; B is true; A causes C; Changes in B cause changes in D; Changes in D and changes in C cause changes in E. There are five aspects (A, B, C, D, and E). Of those five, only E is concatenated (D and C cause E). This allows us to easily find a ratio of well-integrated aspects to poorly integrated aspects of 0.20 (the result of one concatenated aspect divided by five total aspects). Importantly, the validity of each proposition is determined only by the other propositions within the theory.

Theories of physics (e.g. Ohm's law of electricity) tend to be robust to the 1.0 level. It seems to be the robustness of Ohm's theoretical model that enabled its effective testing which, in turn, enabled its elevation to the status of "law" and the subsequent revolutions in power distribution, communication, electronics, computers, and more. In contrast, theories of the social sciences tend to have a very low level of robustness—typically between 0.2 and 0.5—on a scale of zero to one (e.g. Wallis, 2009b). And, along with those low levels of robustness, social theories have not proved very effective in application.

In the next section, I analyze two policy models to determine and explain their levels of robustness and thus suggest their potential efficacy in application. In these analyses, the search for formal robustness is much simplified. Using the models provided for analysis advances us through step three above. Within those models, the causal propositions are already identified by the graphic representations of the logic models. Thus, we need only look at the models to follow step five above – and identify the total number of propositions and compare then to the number of co-causal propositions within each model.

An Analysis of Two Policy Models

Because theories are used to make sense of data, predict the future, and support decision-making, they are conceptually similar to mindsets, organizational schema, or logical models of policy. In this section, I use the insights and methodology presented above to analyze the relationships between propositions found in two policy models that were developed by the Scottish Parliament for a project on reducing damage from drug use (Scotland's Futures Forum *Approaches to Alcohol and Drugs in Scotland: A question of Architecture*, 2008).

These models are maps for understanding the present and emerging situation. As such, they are representative of policy, including data gathering, analysis, and as guides for the actions of decision-makers. While these models might not represent the complete policy, they are used here as concise representations of the policy.

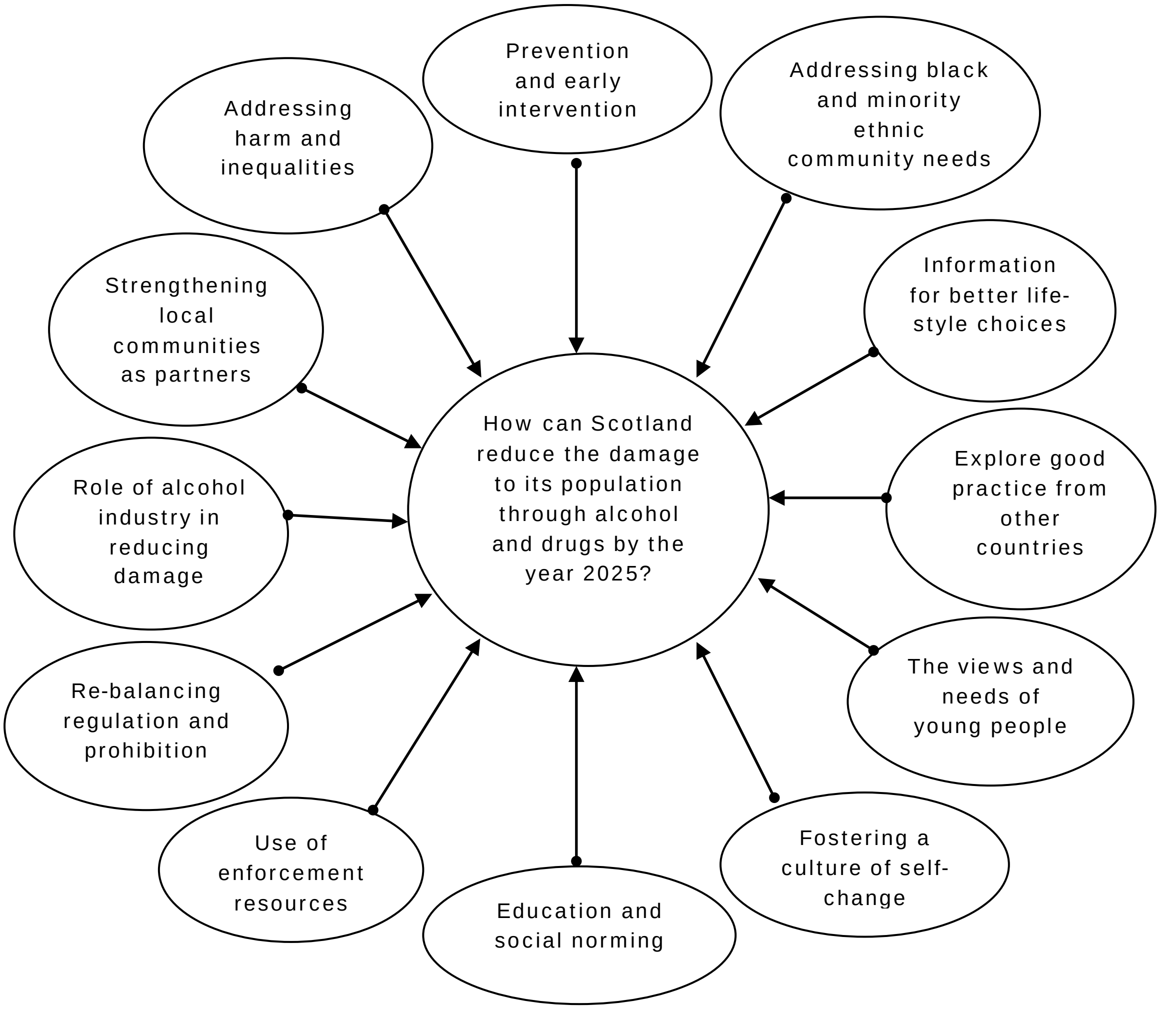
Usefully, for this analysis, the Scottish report portrays two diagrams representing the same overall policy. Importantly, although both diagrams include very similar aspects, the structure of those diagrams is very different. One arranges the aspects of the policy in a “daisy” pattern, while the other diagram presents the aspects in a pattern of flows and co-casual relationships. In short, the two diagrams present two models of the same policy – with very different potentials for successful implementation.

In Figure 2, there are 12 causal dimensions (or aspects), and one resulting aspect (the goal of reduced damage from alcohol & drugs). The resulting aspect (How can Scotland reduce the damage to its population) is a concatenated aspect because it results from more than one causal aspect. Based on Wallis’ method of propositional analysis, the robustness of this model is 0.08 (the result of one concatenated aspect divided by 13 total aspects). Therefore, by itself, this does not seem to be a very useful model for application.

As a thought experiment, one might imagine disparate stakeholder groups arguing over which aspect is most useful, and where funds should be allocated. Additionally, each group in Figure 2 seems to be conceptually isolated from the others – trapped in its own “silo” of limited understanding. One group sees prevention as the cure, while another seems enforcement as the tool of choice.

Similarly, each group might blame the other for lack of overall success of the program. Additionally, we might expect that special-interest groups might struggle to alter and control the meaning of the model over time. The number of petals in the daisy might expand or contract depending on what groups get funded. In short, if Figure 2 were the only guide, this worthy effort toward collaboration might lead, instead, to conflict.

Fortunately, the policy analysis did not stop at this point. Admirably, the project combined expert analysis and input from stakeholders to develop the model shown in Figure 3.



How can Scotland reduce the damage to its population through alcohol and drugs by the year 2025?
Prevention and early intervention
Addressing black and minority ethnic community needs
Information for better life-style choices
Explore good practice from other countries
The views and needs of young people
Fostering a culture of self-change
Education and social norming
Use of enforcement resources
Re-balancing regulation and prohibition
Role of alcohol industry in reducing damage
Strengthening local communities as partners
Addressing harm and inequalities

Figure 3. The 2008 Landscape

(*Approaches to Alcohol and Drugs in Scotland: A question of Architecture*, 2008, p. 62; public domain)

Figure 3 includes many of the same aspects as Figure 2. There are, however, key differences between the two models. First, in Figure 2, the goal of reducing damage from drugs is explicit, while in Figure 3 that goal is tacit. In the same way that most people do not need to be reminded that a useful goal is to achieve a better life, the goal is seen as superfluous when included in the model. Individuals who are seeking a better life do not need to be reminded of that goal: they need useful policy to help them get them there. Second, Figure 3 presents a model that is more complex than the model presented in Figure 1. Although Figure 3 depicts one aspect less than Figure 2, Figure 3 depicts 22 causal relationships, compared to the 12 causal relationships depicted in Figure 1. This increase in complexity suggests more maturity (Ross & Glock-Grueneich, 2008) in the policy model.

Importantly, Figure 3 depicts eight aspects that might be considered concatenated (affected by two or more other aspects). The exceptions are: the science base, wellbeing of community, regulation, and prohibition. Therefore, based on the above-mentioned methodology, the robustness of this model is a respectable 0.67 (the result of 8 concatenated aspects divided by 12 total aspects).

By way of a thought experiment, Figure 3 seems to suggest a more effective model for change, primarily because the actions of each group are expected to produce relevant results for other groups. While the actions of law enforcement may not be evident to public health workers and vice versa, the actions of both are likely to be visible to the broader community.

For example, enforcement may believe that they are taking effective action through their criminal justice approach. Similarly, the evidence and research scholars and the intervention and recovery professionals may believe that they are taking effective action through changes to the science base and the treatment, social support, and health promotion (respectively). Yet, if changes in those areas do not show up as changes in illicit trade and patterns of misuse (visible to the community), either those efforts are not being effective or the model is not an accurate representation of the situation.

We may speculate how stakeholders using a more robust model may be less inclined to argue around the measurable results because each indicator is linked to multiple other indicators. This allows for more direct feedback for more rapid learning so the stakeholders can more easily change their approaches if needed.

Of course, the formal model is based on assumptions that have been made explicit. For example, Figure 3 depicts the treatment (including social support and health promotion) as influencing the balance of benefit and harm as well as the illicit trade. This suggests that the opinions around the effectiveness of treatment must be determined by the view from "downstream."

If those monitoring the balance of benefit and those engaged in illicit trade agree, than it would appear that treatment is doing a good job. If they disagree, it points to the need for a more effective understanding of the situation. And, that understanding may change as the project

SOME RIGHTS RESERVED

advances and new information suggests adjustments to the model. Those changes should be agreed to through a collaborative process.

While the model in Figure 3 seems to have a fairly high level of robustness, it is far from perfect. There are several opportunities to improve the model. For example, in Figure 3 drug trade and alcohol trade are shown as “affecting” the balance of benefit and harm. It is unclear from the model exactly what those effects are.

Does more alcohol trade cause more social harm? Or, are the potential negative effects of the alcohol trade ameliorated by the benefits of treatment? Other uses of vague language include words like: impacts, influences, determines, subverts, inform, shape, and others. More effective language would be “increases” or “decreases.” With experience, analysis, and expertise, the quantitative relationships of those qualitative aspects might also be more accurately developed.

Another opportunity to clarify the model is seen in the aspects of regulation, prohibition, alcohol trade, and drug trade in the upper left hand corner of the model. There, prohibition and regulation are in a linear relationship between policy and legal frameworks on one side, and alcohol trade and drug trade on the other. Abstractly, this is represented as A causes B causes C. In such linear relationships, the intermediate term (B) is redundant (Stinchcombe, 1987) – it adds nothing to the robustness of the model.

Similarly, the aspects of regulation and prohibition are in “parallel” with one another. That is to say, every causal relationship that affects one aspect also affects the other. Therefore, it could be said that regulation and prohibition are effectively the “same thing.” The same is said of the aspects of alcohol trade and drug trade. Parallel aspects do not add to the robustness of the model, and, like linear aspects, should be removed (or revised) in increase the robustness of the model.

I contend that the important difference between the two logic models compared in this section is not simply a matter of complexity, nor is it a matter of the relationship between the model and the analysis and/or implementation of the policy. Instead, the important difference between these models is best seen in their formal robustness (0.08 in the first and 0.67 in the second).

For an abstract example, consider how the model shown in Figure 3 might be made more complex by adding additional “petals” to the daisy – in the form of additional stakeholder groups. While that would add complexity to the model, all the previous concerns (e.g., conflict between stakeholders) would not be reduced. Indeed, they are more likely to increase. And, it is useful to note, that potential for conflict would reduce the chance for successful implementation of the logic model, and, not coincidentally, would reduce the robustness of the model. Therefore, we may conclude that we can increase the chance of policy success by increasing the robustness of the logic model within the explicit policy document.

The evaluation and discussion in this section suggests that it is indeed possible and useful to evaluate policies and programs by investigating the complexity and formal robustness of logic models, and that following these approaches will lead to policies that are more effective in application.

Surprising Insights

An unexpected insight emerged during this study when I noted that a critical shift occurred between Figure 2 and Figure 3. Figure 2 is an axial theory of the sort suggested by grounded theory (Glaser, 2002). An axial theory may be characterized by having a number of causal influences – all leading to a common result.

In contrast, Figure 3 represents a theory used for achieving that shared goal where the goal itself is tacit to the model. This is important to the extent that having a goal is very different from having a theory that will enable one to reach that goal. This approach seems to be in line with the idea of "problem solving without a goal" (Simon, 1996, p. 106), where the goal is to find greater understanding.

For example, by way of analogy, let us say we have an engineer whose goal is to design a radio. The engineer will doubtless use Ohm's law to design that radio, and, procedural errors aside, the radio will function effectively. Yet, it should be noted, Ohm's law does not include "radio" as a word or concept.

This example stands in stark contrast to many theories and policy models where the goal is an explicit part of the theory. In the example of designing a radio, a goal-oriented theory might include the proposition, "More electricity, more radio waves, higher standards, more components, and more engineers will result in the design of more and better radios." While this claim is undeniably useful, such a goal-oriented theory has a very low robustness. Further, no workable radios would be designed without the use of Ohm's (robust) law.

Rescher (2005, p. 106) explores the difference between theory and goal suggesting, "… it is accordingly important to distinguish between the *ontological* systematicity (simplicity, coherence, regularity, uniformity) of the *objects* of our knowledge…." Or, metaphorically, the lens is different from the observer and different from the observed. Similarly, in his explorations into metatheory, Ritzer (2001, p. 161) suggests the idea of "decentering" where theorists should move away from identifying a goal and move toward developing metatheory that is understood as a "field of relationships."

A "goal" is not the same thing as a task, concept, or relationship. The goal is more like a vision or an ideal. Therefore, having a goal (imaginative or creative ideal) as an integral aspect of a theoretical construct—which is better described as a representation of an existing perceptual-based system—is a violation of ontological systematicity, and specifically a violation of uniformity. It is an apple among oranges – out of character and out of its appropriate category. The distinction between the two seems to have been inadvertently glossed over by "…what rhetoricians call *chiasmus*, an exchange of properties that serves to blur the differences between the entities from which the properties are drawn" (Fuller, 2006, p. 22).

For a metaphorical example, if one enjoys viewing the color red, one may enjoy sitting in a room with red walls, or viewing red roses. One may even go so far as to wear red-tinted spectacles. However, using red-colored glasses to view red roses will tend to obscure the roses. Similarly, a theory that explicitly includes the goal can, in some sense, obscure a deeper level of understanding. In short, the present analysis suggests that it is important that we do not confuse the goal with the policy understanding necessary for achieving the goal. Importantly, therefore, having the goal as a part of the model may be a distraction at best and a critical flaw at worst.

Conclusion and Extensions

Our philosophies are moving away from modernist, through postmodernist and into more effective, neo-integral, ways of thinking. In this paper, methods based in neo-integral thinking have proved useful in identifying and comparing the complexity of policy models (Ross & Glock-Grueneich, 2008) and the degree to which those models are integrated (Wallis, 2008a, 2008b). This evolution in thinking seems to be reflected in our approaches to policy development.

In decades past, theories of policy development were relatively simple. It was found, however, that this approach did not result in effective policies and programs. Luminaries such as Kingdon advanced the field by offering more complex models. However, the current state of the world suggests that these new models have not resulted in the creation of more effective policy. This has led to a criticism of Kingdon’s work by Sabatier who has provided alternative models to better understand the policy process. Despite, or because of, this conflict in the field of policy, there is no clear consensus about how to compare policy models in any objective way. This impedes our ability to choose between multiple competing policies or to identify the best way to improve a program.

A common feature in almost every policy is the logic model. Yet, the policy literature leaves tacit the idea of investigating the internal structure of a logic model. Before the contribution I offer in this paper, there was no way to conduct an objective comparison of policies – we were forced to rely on the “plausibility” of a model (e.g. Schmidt et al., 1979, p. 48). As such we are forced to rely on untested assumptions and, “relying on unspoken assumptions may lead to folly as easily as wisdom” (Wallis, 2009c). Based on the current state of the world, this certainly appears to represent our level of policy evaluation and comparison.

Because the logic model is an explicit representation of the policy document, it stands as an abstract representation of the policy - a lynchpin of the process. Critically, comparing logic models with a sense of objectivity allows us to reliably decide which policy to implement or how to advance a policy toward greater effectiveness. The present paper provides an important contribution to the policy literature by suggesting two methods for the objective analysis of Logic models.

In developing objective measures for logic models (to the extent that they represent the policy as a whole) this contribution answers multiple calls: first, for better theory (Sabatier, 1999), second, for more predictive theory (deLeon, 1999). These insights, in turn, suggest the opportunity for a research program to determine if there is a relationship between the robustness of the logic model and the successful implementation of the policy.

The metapolicy analyses reported above were a critical comparison of two logic models using a methodology originally developed for metatheoretical analysis. Results indicate that the highly robust (R = 0.67) model in Figure 3 will be more effective in application than the low robust (R = 0.08) model in Figure 2.

A limitation of this study is the difficulty of confirming the correlation between the robustness of a policy model and the effectiveness of that model in application. Similarly, this analysis does not address aspects of policy-making that are outside the formal model or “off the page,” such as the mood, health, superstitions, or prejudices that might alter the politician’s decision-making process. Additionally, this study is limited because it compares only two models. Future studies should compare more models, models from a wider range of policy areas, and compare policies with the results of their implementations.

Additionally, future studies should investigate the robustness of historical policy decisions to find what correlation exists between the robustness of the policy and the historical results of that policy’s implementation. In this form of study, it would also be useful to determine if the policy decisions actually followed the policy. It may be found that the stated policy had a high level of robustness while the implemented policy had a low level of robustness (or vice versa). For future policy development, I suggest that any policy analysis should include a study of the logic model itself, to determine the robustness of the policy.

Of course, a robust structure of policy theory is not the be-all, end-all of policy. As noted earlier, it is also important to consider other aspects of policy development (including data gathering, analysis, and how the policy is implemented). Improvements in each of these areas will add to the efficacy of policy. The ideas presented in this paper are intended to complement, not supplant, existing methods of policy analysis

Our understanding will always be limited, but that does not excuse us from expanding our understanding. By developing an understanding that is more complex and more carefully integrated, we may understand more clearly the richness and the limitations of our knowledge – and how we may improve the production and efficacy of policy models and policy with significant implications for improving the human condition.

The U.S. Imperial Jugger-*not:* Saturation Points and Cultural Globalization

Meg Spohn Bertoni[1]

Abstract: Globalization is not merely inevitable western cultural conquest. The assumption that the juggernaut of western hegemonic domination will continue until the world is consumed is a common one, but not an accurate one. That accuracy is compromised by a number of related misconceptions about the nature of globalization. Some of these have to do with an attachment to dichotomy in a world too complex for dualism. Some of them are related to assumptions about the nature of trade, of trends, of inevitability, and of statistical prediction that turn out not to be accurate—and by extension misconceptions about the unidirectionality of cultural exchange. Most are related to misconceptions about the nature of culture—particularly in oversimplifying, and making strange assumptions about, nonwestern cultures. Cultures change over time, with generations and historical forces—today's cultural changes make up tomorrow's cohesive culture. Cultures die not when they change to reflect the new attitudes and lifestyles of the peoples who live in them, but when they stagnate and become static, preserved only in museums, artifacts and books, and not in the everyday lives of the people themselves. Finally, phenomena do reach a saturation point, from biological populations to the motion of catamarans to absorption of cultural values, and these can be observed using methods of nonlinear dynamics. This project considers common misconceptions about globalization and culture, and uses concepts from nonlinear dynamics to expose the nature of the movement and saturation points of cultural globalization.

Keywords: Complexity, culture, domination, dualism, globalization, international system, nonlinear dynamics, non-western, prediction, self-organization, saturation points

Introduction

In recent years in international relations, globalization has become a major area of study. No wonder—it touches every other area of interest in international relations, and its effects are clear to people around the world. However, a number of misconceptions about it have been popularized, among scholars, students, and members of the general public alike. One of the most pervasive is that globalization is merely inevitable western cultural conquest. The assumption that the juggernaut of western hegemonic cultural domination will persist until the world is utterly consumed is a common one, but not an accurate one.

A large part of the misconception problem is the ways in which scholars and journalists have been trained to think about global phenomena, which permeates the ways in which they write

---

about it and inform others. It is high time, however, to abandon theoretical structures that are no longer useful in comprehending and explaining complex phenomena such as globalization. In constructing strong theory, it is imperative to abandon the pervasive focus on dichotomy and other artificial simplifications, and consider frameworks more appropriate to the very complex international system, which defies dichotomy and oversimplification. This piece addresses some of the major misconceptions about this area of inquiry, and suggests more complex, dynamical ways of thinking about the complex, dynamical world order.

With regard to politics and the political, this article offers academics, journalists, theorists, students, and curious members of the general public (among others), a different way to think about the things we are all told about the nature of globalization and culture—and common assumptions about them. From this, one hopes we may all consider our dynamical world more completely and accurately, whether working to shape still-struggling post-Cold War political theory, traveling to or thinking about other cultures, or forming our opinions from the world news of the day. Through bringing together international relations theory, nonlinear dynamical systems, and additional critical thought from cultural studies, the global affairs classroom, and even evolutionary biology, we may gain insight into current problems in thought and in practice with regard to international politics—from political and cultural relationships and impacts, to the theories that shape thinking and policy, to the interconnectedness of global society and its development.

First, we consider what some of the most common misconceptions are surrounding globalization, and some of their likely causes. Each of the misconceptions is then regarded in detail, and critiqued along the way, using observations about the global system, culture, theory building, and key concepts from nonlinear dynamics. Through careful consideration, we can draw some conclusions about different ways of thinking about globalization that may yield greater understanding and more fruitful international relations theory.

Global Misconceptions

During the last four spring terms at a moderately-sized western American university, the author has taught a graduate-level course (usually two online sections) about the phenomenon of globalization, and its many forces and implications. Happily, the online sections include graduate students who are participating in the course from various locations around the world, are from other countries, or are otherwise well-traveled. Through asynchronous discussion, these many informed perspectives often create a truly global one, offering insight considerably greater than the sum of its parts to all the participants. So pervasive are certain misconceptions about globalization, however, that they are not only largely held by the general public, but they are also held by nearly all of this bright cross-section of the adult population, at least upon entering the course.

There are many possibilities as to how this state of misconception and misinformation persists. One is that globalization as such is still a very new field of study. Although answers to current questions may become obvious with hindsight and experience, the pressure to predict is strong, and journalists and scholars alike try hard to have the next big, important idea that will guide the field of study of globalization through its nascent period and beyond. Some find ideas and latch onto them, wanting them to be true because they offer the comfort of a predictable trajectory in a global system currently rife with uncertainty.

This pressure is likely exacerbated by the paucity of strong and far-reaching post-Cold War theory in international relations. The former world order, with its two spheres of influence and zero-sum game theory, when put into historical perspective, was something of a fluke, albeit one that lasted half a century. As we return to the messier and far more historically prevalent world system, the last few generations of scholars have not been trained to think about it, because it was not then pertinent to the contemporary world order. Those international relations scholars who were trained before the Cold War, and whose work was to have informed the coming decades before the outcomes of World War II changed everything, are now separated from the generation of scholars tasked with creating new theory responsive to the twenty-first century's global system by at least two generations, if not by retirement, or by death. Starting from scratch is more difficult than building on the work of the previous generation. In the meantime, many theories are circulating and awaiting broad recognition. It makes sense to keep trying until something catches on.

Another possibility is simply that some of the people with the greatest access to publication about the new global system do not have truly typical experiences of the places they visit and later write about. Often, the elites of given nation-states or regions have more in common with each other than they do with their own fellow residents of those states or regions. An elite American, for example, is likely to stay in the finest hotel in Nairobi, with other traveling elites (some of them Kenyan, certainly, but even a hotel full of local citizens is still a mere hotel full in a nation of thirty-eight million—and an atypical hotel full at that) and as far as possible from Nairobi's shanty town of Kibera—and its more than one million inhabitants. Elites from all parts of the world usually prefer to isolate themselves from the grittiness of most of the world's everyday existence when they can, and consequently, often miss the whole picture, or even the typical one—and these are the people who have the best access both to travel and to publication. Therefore, they are most likely to inform opinions at home, and even bright, critically-thinking people rarely get the perspective of the average person's experience in another country unless they actually mange to go there at some point. In the meantime, global golfing and fine dining anecdotes, for example, are a poor substitute for informed cultural insights about regular folks in other parts of the world.

Additionally, with the general public more interested than ever in international news, and a twenty-four-hour news cycle, we get surprisingly little insight about international events from the American news media. It used to be that each news organization had regional bureaus all over the world, so when news happened there, someone was on hand to report on it, and to give some informed geo-political context to the events. This practice of maintaining far-flung news bureaus is no longer considered cost-effective, and news personnel are quickly flown to the place where news is happening instead. While this does gather information for news organizations at unprecedented speed, the lack of context previously available with knowledgeable localized news bureaus damages the quality of that information. When the news consumer gets the story, historical and other contextual pieces may be missing, or merely assumed rather than confirmed, or lived. In this way, misinformation is often carried along with information. The savvy news consumer may consult multiple sources on a given story in order to better inform his or her own comprehension, but this method is often considered too time consuming for the general public to engage in on a daily basis. In this way, misconceptions are also perpetuated, by omission, lack of context, and assumptions, by the news organizations and by the consumers themselves.

The most common misconceptions (often bolstered by some news media and even some scholarly articles) are these:

- Globalization is either “good,” or it is “bad.”
- Globalization is primarily about trade, and trade causes peace.
- Globalization is a new phenomenon, and it is truly global.
- Past events are a good blueprint for future predictions.
- Globalization is a one-way street of destructive cultural domination from the west to the rest.

In order to avoid such misconceptions, to rethink them, or even to come up with new and applicable theories responsive to the twenty-first century, it is necessary to think differently about the nature of the international system—that is, as a large, complex, and interconnected system. It is poorly suited to two-poled game theory models and dichotomous constructions. It is, however, well suited to the emerging science of nonlinear dynamics. Let us consider each of these misconceptions in turn, and the conceptual pieces from nonlinear dynamics that can help us consider the reality of the messy international system, rather than creating flat, oversimplified constructions, theories, and models, and attempting to argue their application in a complex world.

“Globalization is either ‘good’ or it is ‘bad.’”

So pervasive is this notion, in the virtual classroom, in the literature, and elsewhere, that it seems that we cannot continue to consider anything else until we have solved this conundrum—and that is what makes it the major question to be answered about globalization. The international system, however, is dynamic, complex, and in a constant state of flux. Globalization is a sort of complex system within that one, with many sub-systemic forces of its own. It is too complex to be labeled either “good” or “bad,” and even if it weren’t, it has no intent or agency of its own by which we may judge its moral character.

For the sake of consideration, however, perhaps we should attempt to qualify it further. Perhaps we could say, “good for trade” and “bad for non-western laborers.” Even these statements require further iterations of qualification, though. Aside from points of comparison (e.g., Better or worse than what?), these normative assessments break down immediately at the first sign of attempted qualification, too. Good for whose trade? In the long term or just the short term? Is the interconnectedness of global markets not also a vulnerability when things aren’t going so well, giving one piece the power to bring down the whole? Bad for which non-western workers? Those who are immigrants working in sweatshops located in the west, or just those who are still in their countries of origin? Bad for each individual worker, or bad for their community, nation-state or region? How is it bad? Is it bad if there are jobs in a poor area where there were no jobs before, even if wages are low by western standards? What if it is a clean industry and doing less environmental damage than, say, clear-cutting rain forests in favor of farmland? Is that still bad?

It is possible that this desire for comfortable dichotomy is part of Cold War international relations theory's two-poled, zero-sum legacy, but the literature of globalization is rife with it, whether the either-or pair is good-bad, corporation-worker, the west-the rest, patriarchal-feminist, old-new, rich-poor, and the list goes on. Certainly, a construct may be simplified to make a point and help guide one's thinking about complex issues. After all, an actual-size roadmap is of no use. However, one that oversimplifies something so complex, claiming it falls into one of two specific, diametrically opposed categories, is at best a blunt instrument.

Additionally, to attempt to resolve a dichotomous pair by saying, "perhaps the answer lies somewhere in between these two points" does not help us either, attractive as it may seem, at least from a conciliatory standpoint. The Golden Mean of the Ancient Greeks does not sharpen that blunt instrument, or our insights. In the immortal words of Stephen Jay Gould, "I strongly reject any conceptual scheme that places our options on a line, and holds that the only alternative to an extreme positions lies somewhere in between them. More fruitful perspectives often require that we step off the line to a site outside the dichotomy" (Gould, 1990, p. 51).

The complex nature of globalization is not so much about the flipsides of conceptual coins, or even their edges, as it is about complex, emergent behavior of entire systems. Stepping off that line is beginning to happen, however. Let us consider some of the key concepts that resolve the perception of globalization as somehow "good" or "bad."

> How do birds keep their movements so orderly, so synchronized? Most people assume that birds play a game of follow-the-leader: the bird at the front of the flock leads, and the others follow. But that's not so. In fact, most bird flocks don't have leaders at all. There is no special "leader bird." Rather, the flock is an example of what some people call "self-organization." Each bird in the flock follows a set of simple rules, reacting to the movements of the birds nearby it. Orderly flock patterns arise from these simple, local interactions. None of the birds has a sense of the overall flock pattern. The bird in front is not a leader in any meaningful sense—it just happens to be there. The flock is organized without an organizer, coordinated without a coordinator.
>
> Bird flocks are not the only things that work that way. Ant colonies, highway traffic, market economies, immune systems—in all of these systems, patterns are determined not by some centralized authority but by local interactions among decentralized components. As ants forage for food, their trail patterns are determined not by the dictates of the queen but by local interactions among thousands of worker ants. Patterns of traffic arise from local interactions among individual cars. Macroeconomic patterns arise from local interactions among millions of buyers and sellers. In immune systems, armies of antibodies seek out bacteria in a systematic, coordinated attack—without any "generals" organizing the overall battle plan. (Resnick, 2001, p. 3)

So it is with the phenomena we are considering here. Globalization is not a conscious entity. It doesn't make decisions or direct the behavior we associate with it. The flow of goods and ideas, of human capital, generational change and migration: none of these things has a leader or an organizer. These phenomena and others emerge without direction in the global system in much the same way bird flocks make their ways and traffic jams emerge from the flows of vehicles. Nobody directed that traffic jam to happen, just as nobody directs the Internet or global climate change. This is not such a strange concept, although it is also, for some reason, not quite as intuitive as perhaps it seems it should be.

> Almost everywhere you look these days, there is evidence of decentralization. You can see it every time you pick up a newspaper. On the front page, you might find an article about the shift in corporate organizations away from top-down hierarchies toward decentralized management structures. The science section might carry an article about decentralized models of the mind, or maybe an article about distributed approaches to computing. And in the book review you might read an article suggesting that literary meaning itself is decentralized, always constructed by readers, not imposed by a centralized author.
>
> But even as the influence of decentralized ideas grows, there is a deep-seated resistance to such ideas. At some deep level, people seem to have strong attachments to centralized ways of thinking. When people see patterns in the world (like a flock of birds), they often assume that there is some type of centralized control (a leader of the flock). According to this way of thinking, a pattern can exist only if someone (or something) creates and orchestrates the pattern. Everything must have a single cause, an ultimate controlling factor. The continuing resistance to evolutionary theories is an example: many people still insist that someone or something must have explicitly designed the complex, orderly structures that we call Life.
>
> This assumption of centralized control, a phenomenon I call the *centralized mindset*, is not just a misconception of the scientifically naïve. It seems to affect the thinking of nearly everyone. Until recently, even scientists assumed that bird flocks must have leaders. It is only in recent years that scientists have revised their theories, asserting that bird flocks are leaderless and self-organized. A similar bias toward centralized theories can be seen throughout the history of science. (Resnick, 2001, pp. 3-4)

The centralized mindset persists, along with an attachment to dichotomy, but we are beginning to let go. This will be discussed in greater detail below. In the meantime, as a complex part of a complex system (the international system itself being such a self-organizing system as the patterns discussed above), globalization is no more "good" or "bad" than a particular weather system or a mammal's endocrine system. It has neither benevolence nor malevolence, nor does it have intent. Nobody is controlling it. It is merely complex.

"Globalization is primarily about trade, and trade causes peace."

By extension, then, globalization is certainly too complex to be primarily about any one of its major components. If it weren't, we would not have had to coin a new term like "globalization" in order discuss it. Certainly, trade is one of the complex sub-systems of globalization—but let us not forget the globalizing of religion, of ideas, of social contact, of human migration, of language, of culture, of advancing technology and telecommunications, of environmental and ecological concerns, and many others.

Interestingly, those who champion globalization as being primarily "good" are often those who believe trade causes peace. The logic works like this: everybody wants to make money and exchange goods and services. Therefore, if one is having a financially fruitful relationship where one and his or her trading partner are mutually making money and exchanging goods and services, both will want that to continue. Therefore, each will be inclined to work at keeping that relationship strong and stable, will share at least that value and probably others, and will be less likely to allow violence to come between them.

That is arguably an admirable sentiment. History, however, does not bear this theoretical prioritizing out, and the lessons of history might even have us label it terribly naïve. There have been many instances throughout history where previously strong trading partners became embroiled in armed conflict. The Delian League, created after the first Peloponnesian War, made much of the Aegean friendly trading partners, and the entire League friends and trading partners with Athens—until Athens, the greatest beneficiary of all this trade and good feeling, started the second Peloponnesian War, during which they were roundly smashed by the Peloponnesian Confederacy, including Sparta, Corinth, Thebes, and others. The *Pax Romana* was largely based on trade and tribute, and still it fell. Early European colonists initially experienced good trade relations with local Native American societies. France and Germany were trading partners before World War I, and even stronger ones between the world wars, at least up until 1939, when Germany invaded Poland. The United States continued to trade with Germany until 1941. These are just a scant few examples of the rich historical tradition of making war on former trading partners.

Even when trading partners enjoy a long period of peaceful trade and never have any significant conflicts with each other, trade truly does not cause peace. Trade and peace are often correlative, but if their relationship is at all causal (however unlikely), it is more likely that peace simply aids the preferable conditions for trade—while that peace lasts. The misconception that trade causes peace is not a new one, either. Often, when some new invention seems to have a stabilizing force and to create more commodious conditions for the exchange of goods and ideas, articles and speeches proliferate that credit trade. Consider this account of how this misconception played out during the Long Peace:

> The long peace that followed the Battle of Waterloo was increasingly explained as the result of the international flow of commodities and ideas. "It is something more than an accident which has turned the attention of mankind to international questions of every description in the same age that established freedom of commerce in the most enlightened nations." So wrote one of the early biographers of Richard Cobden, merchant of Manchester and citizen of the world. Variations of the same idea were shared by Sir Robert Peel, William Gladstone, John Stuart Mill, scores of economists and poets and men of letters, and by England's Prince Consort, Albert the Good. His sponsorship of the Great Exhibition in the new Crystal Palace in London in 1851 popularized the idea that a festival of peace and a trade fair were synonymous. The Crystal Palace was perhaps the world's first peace festival.

> In that palace of glass and iron the locomotives and telegraphic equipment were admired not only as mechanical wonders; they were also messengers of peace and instruments of unity. The telegraph cable laid across the English Channel in 1850 had been welcomed as an underwater cord of friendship. The splicing of the cable that snaked beneath the Atlantic in 1858 was another celebration of brotherhood, and first message tapped across the seabed was a proclamation of peace: "Europe and America are united by telegraphic communication. Glory to God in the Highest, On Earth Peace, Goodwill Towards Men." That cable of peace was soon snapped, and so was unable to convey the news in the following year that France and Austria were at war, or the news in 1861 that the United States was split by war. (Blainey, 1988, pp. 18-19)

Where, then, does the idea that trade causes peace come from? It is likely the result of misread linear statistical analysis. For one thing, linear statistics can make it tempting to project future events based on past ones (a practice which will be challenged in greater detail below). They also lend themselves to a variety of misinterpretations. This is a prevalent problem in international relations theory overall, and indeed, in the social sciences as a whole. It is a fundamental conflation of correlation and causality.

> In the second most prominent fallacy about trends, people correctly identify a genuine directionality, but then fall into the error of assuming that something else moving in the same direction at the same time must be acting as the cause. This error, the conflation of correlation with causality, arises for the obvious reason (once you think about it) that, at any moment, oodles of things must be moving in the same direction (Halley's comet is receding from Earth and my cat is getting more ornery)—and the vast majority of these correlated sequences cannot be casually related. In the classic illustration, a famous statistician once showed a precise correlation between arrests for public drunkenness and the number of Baptist preachers in nineteenth-century America. The correlation is real and intense, but we may assume that the two increases are causally unrelated, and that both arise as consequences of a single different factor: a marked general increase in the American population.
>
> …The common error lies in failing to recognize that apparent trends can be generated as by-products, or side consequences, of expansions and contractions in the amount of variation within a system, and not by anything directly moving anywhere. … Thus, if we mistake the growth or shrinkage of an edge for movement of an entire mass, we may devise a backwards explanation. (Gould, 1996, p. 32 – 33)

In other words, trade and peace are correlative—that is, they often travel together. The relationship is not causal, however. Trade does not cause peace, rather, trade and peace are both made possible by political and economic stability, and bolstered by any number of other factors, such as desire for imported goods, a curiosity about other peoples, simply having no interest in conquest at the time, and the like.

Unfortunately, for an area of focus so obsessed with numerical measurement and precision of economic forecasting, many trade theories are disastrously unresponsive to the motion of real-world trade dynamics. Other than critically assessing what linear statistics is really telling us and keeping in mind how correlation can masquerade as causality otherwise, the new theories about trade and economics that *are* responsive to real-world dynamics are those that embrace the complexity of the system rather than trying to pare it down to simplified components. Consider, for example, an account of how complexity theory contributes to economics.

> Conventional economics, the kind he'd been taught in school, was about as far from this vision of complexity as you could imagine. Theoretical economists endlessly talked about the stability of the marketplace, and the balance of supply and demand. They transcribed the concept into mathematical equations and proved theorems about it. They accepted the gospel according to Adam Smith as the foundation for a kind of state religion. But when it came to instability and change in the economy—well, they seemed to find the very idea disturbing, something they'd just as soon not talk about.
>
> But Arthur embraced instability. Look out the window, he'd told his colleagues. Like it or not, the marketplace isn't stable. The *world* isn't stable. It's full of evolution, upheaval, and surprise. Economics had to take that ferment into account. And now he believed he'd found the way to do that, using a principle known as "increasing returns"—or in the King James translation, "To them that hath shall be given." Why had high-tech companies scrambled to locate in the Silicon Valley area around Stanford instead of in Ann Arbor or Berkeley? Because a lot of older high-tech companies were already there. Them that has gets. Why did the VHS video system run away with the market, even though Beta was technically a little bit better? Because a few more people happened to buy VHS systems early on, which led to more VHS movies in the video stores, which led to still more people buying VHS players, and so on. Them that has gets. (Waldrop, 1992, p. 17)

This is just one example of an economic idea previously considered counter-intuitive that turns out to have a great deal of real-world application. It is only counter-intuitive, however, because it runs counter to assumptions about the nature of economics and of the global economic system. It is far easier to discard new theories that don't fit with the current mindset than it is to rethink the assumptions of a field of endeavor. The new thing, the smaller thing, is ignored in favor of the larger body of comfortable existing ideas, even if they are rapidly losing what explanatory power they may have had in a more simplistically viewed global system. In this way, increasing returns plays out ironically. Them that has gets, even in the way that the more widely prevalent model doesn't fit the reality of the strange, emergent world order.

"Globalization is a new phenomenon, and it is truly global."

While the world does seem to be getting "smaller" and more interconnected in some places, it can only do that where the proper infrastructure exists. Is the world getting "smaller" in Sierra Leone, for example? The average person there does not, for example, have an Internet connection. It is possible there is a satellite television somewhere nearby, but not in everyone's home. Goods are not available with the ease they are in the industrialized world—nor is a broad range of communication, or easy mobility of people or capital, for that matter. If globalization does not reach all over the globe, perhaps it cannot be considered truly global—at least not in a uniform, all-encompassing way (and the lack of homogeneity in and across cultures is very important to consider, as we shall see below). By the same token, there is also no reason to think that the phenomena of globalization will continue where there is no infrastructure to support the means of their spreading. Uniformity is thwarted by too-broadly differing conditions in which people make their lives.

Further, the assumption about the developing world—that it will develop infrastructure, technology, and financial and social systems in much the same way that the industrialized nations have (just some years behind)—is very strange indeed once examined closely. Consider, for example, that in many parts of the developing world, one can get an excellent cellular telephone signal. Much of the African continent was never wired for telephone land lines, and as a result, bypassed that quickly-obsolescing technology completely. Why would any African government, NGO, or telecommunications organization implement such a technology, when the newer technology is readily available, more practical, and a great deal less expensive? The developing world need not, and should not, follow along the western trajectory, especially while creating any technological or communications infrastructure. Where infrastructure does not exist at all, the globalizing forces that use that infrastructure cannot reach (just as a train cannot travel where there is no track), and where it is being built, it may well take on a completely different character than what the western world imagines. Different cultures with different experiences create their futures differently, not homogenously, along the same linear track.

It is also important to note that people have been traveling, trading, sharing technology and culture and ideas, and conquering each other, for as long as there have been humans. Nor did globalization begin with the European age of discovery, or with Greek and Roman trade routes, or with China’s Silk Road. While we lack surviving written records of every contact or conquest, we do have an archaeological record that puts various peoples’ travels at various points in the human timeline. Conquest, the exploitation of others' resources, battle, hunting to extinction, climate change, and all the things we may think of as being more negative about how humans interact with each other and their environment on a global scale, have been going on for thousands upon thousands of years. (For a particularly good discussion of many of these meetings and impacts, see Diamond’s (2005) *Guns Germs and Steel: The Fates of Human Societies*.) The primary difference in what we are observing today and what has been happening throughout history is that these days, it is simply happening at greater speed (facilitated by ever-progressing technology), and with a larger swath of the overall human population participating at once.

“Past events are a good blueprint for future predictions.”

While considering past experience is useful for analyzing present situations and how they unfolded, the past is not particularly helpful in predicting the future. For one thing, hindsight often gives us a sense of inevitability that we then project onto future events. It is easy, in hindsight, to see a chain of events as it unfolded and assume it was inevitable. However, simply because we have arrived here does not mean it was somehow meant to be, or that progress to this point came as a single, straight, unidirectional arrow. Let us return to Gould for an excellent example of how our perceptions in hindsight make the continuation of trends look inevitable. In discussing the evolution of horses, he remarks,

> The lineage of *Hyracotherium* to *Equus* represents only one pathway through a very elaborate bush of evolution that waxed and waned in a remarkably complex pattern through the last 55 million years. This particular pathway cannot be interpreted as a summary of the bush; or as an epitome of the larger story; or, in any legitimate sense, as a central tendency in equine evolution. …
>
> We therefore arrive at my favorite subject of ladders versus bushes, or … individual pathways chosen with prejudice versus entire systems (full houses) and their complete variation. … Evolution rarely proceeds by the transformation of a single population from one stage to the next. Such an evolutionary style, technically called *anagenesis*, would permit a ladder, a chain, or some similar metaphor of linearity to serve as a proper icon of change. Instead, evolution proceeds by an elaborate and complex series of branching events, or episodes of speciation (technically called *cladogenesis*, or branch-making). A trend is not a march along a path, but a complex series of transfers, or side steps from one event of speciation to another. The evolutionary bush of horses includes many terminal tips, and each leads back to *Hyracotherium* through a labyrinth of branching events. No route to *Hyracotherium* is straight, and none of the labyrinthine paths has any special claim to centrality. … We run a steamroller right over a fascinatingly complex terrain when we follow the iconographic convention for displaying the pathway from *Hyracotherium* to *Equus* as a straight line. (Gould, 1996, p. 61 – 63)

The same can be said of the evolution of this emerging global system, and our interpretation of inevitability about a great many things. Any number of things *could* have happened in the complex, self-organizing international system, and looking backward down the pathway of things that *did* happen does not make those things inevitable, or even necessarily likely, in any way. Furthermore, knowing this should serve to educate us all as to how likely we are truly to know what is coming next. If we cannot consistently and accurately predict the weather more than five or so days out, predictions about the global polis are at least as problematic (and just as inevitable). Any branching or sidestep may be next. Since there was no inevitable straight line to this moment in history, we certainly should not assume that the timeline between this moment and the one from which we may later look back upon it will be a straight and predictable line either, or a pat and perfect stage, merely because we can see, in retrospect, the path we took to get here. We cannot accurately assume inevitability.

Gould also mentions in *Wonderful Life* (1990), a sort of prequel to *Full House*, that rewinding and “replaying life’s tape” of the evolution of life on earth would not likely yield the same results—too many random things come into play along the branching, forking “bush” of human experience. For example, if a particular creature had not survived a mass extinction when an underwater layer of sediment collapsed upon its contemporaries, chordates and vertebrates might have evolved very differently, or not at all. If other contemporaries had survived instead, the basis for later generations of life would have been entirely different as well. Creatures evolve as they do because of a mixture of natural selection, geography, luck, and many other factors. With one minor change in any of them, the evolutionary story of a particular family of creatures becomes entirely different. With life and ecosystems and natural populations being so closely intertwined, if any are different, all is different.

So it is with globalization in particular, and human cultures and populations in general. Had the invading Normans not had stirrups on their horses' saddles at the Battle of Hastings in 1066, they would not have had the great tactical advantage of being able to fight from horseback, and might not have won. English might then have remained a phonetic Germanic language, rather than being heavily influenced by French at that time. English today might be much more easily spelled, pronounced and learned, but for the stirrup. One tiny, unaccounted-for piece of hardware thwarted inevitability and altered forever the evolution of a linguistic system.

At the time, the English considered their victory over the Normans inevitable: they outnumbered their foe and fought for their way of life on their own ground. So it is with many major turning points of history. We see it even today. The world was a changed place on September 12, 2001, yet nothing was inevitable about the changes precipitated by the previous day's attacks. Initially, Americans came together in solidarity, and much of the world mourned with them. What if the US had continued along that course of unity instead of pursuing a series of fearful and destructive polices at home and elsewhere? The invasion of Iraq certainly was not inevitable. It was not even connected to the terrible events of September 11, except by specious argument.

Like looking back from the horse to its early ancestors, many things look inevitable in retrospect from where we stand, but we must not confuse a retrospective straight shot that omits the many branchings and missteps and decisions along the way as inevitability. Were we to rewind and replay history's tape, events could unfold entirely differently, depending on human perceptions, decisions, and random factors. We could not have known then what would come to be. That being said, perhaps we should not look forward and assume we are ever on some sort of historical straight path to inevitability, rather than on a branching fork of our story, or a misstep or false start of some kind. The world changes suddenly and we cannot account for it. Consider the aforementioned generation of international relations scholars, training to understand a pre-Cold War multipolar international system, or the myriad dissertations being written in 1989 about Cold War politics when the Berlin Wall came down, changing everything. The human experience is not inevitable, whether looking backward or forward.

"Globalization is a one-way street of destructive cultural domination from the west to the rest."

As with forensic science and physical evidence, every contact leaves a trace. The flow of cultural impacts, goods and services, communications, and socialization move in many directions, not just one. Globalization is more mutual than that, with the goods, attitudes, and news of other cultures welcomed in, and permeating, everyday western and non-western lives alike. We in the west can get mangoes (the most popular fruit in many parts of the world, but not in the US) in the supermarket all year 'round. We can get hummus, and sushi, and cheap electronics, and thousands of other imports we use throughout our daily lives, with the same ease and convenience with which we get a carton of milk or loaf of bread. Most major US cities have restaurants featuring the ethnic foods of scores of other countries. One can have Ethiopian food one night and Pho the next. Japanese anime and manga interest artists and fans all over the world. Bits of culture flow in many different directions, with the west on the receiving end, too. Cultural exchange, and indeed acceptance, if not embracing, of it, is nowhere near unidirectional.

With regard to cultural impact and change, we have a word for cultures that do not change anymore, that are not dynamic but static, that are preserved perfectly in time, in museums, and in books and artifacts: dead. Cultures change over time, and with generations and historical forces—today's cultural changes make up tomorrow's cohesive culture. Cultures die, not when they change to reflect the new attitudes, interests and lifestyles of their people (particularly the next generation, who will carry the culture forward), but when they stagnate and become frozen in time and context, and are no longer lived out in the everyday lives of the people themselves.

Additionally, it is important to note that American and other western businesses that do well in other parts of the world are those that adapt to local tastes and sensibilities. Some westerners who go abroad certainly take notice of this practice. As one student in an online section of the aforementioned globalization course noted,

> I did go into a McDonalds' in Singapore once looking for a vegeburger and thinking I might find it in an Asian McDonald's. I was wrong. They didn't have soy burgers but they did have more than one type of fish sandwich and their buns were made from rice and not wheat. There were other changes on the menu that reflected the tastes of the location. But at the same time, there was no question in my mind that I was in an American fast food restaurant. In my opinion, McDonald's is McDonald's no matter where you go.
>
> But even so, I don't think that because American fast food is all over the world it means the people are becoming Americanized any more than it means I am becoming Swedish if I go to IKEA. (F. Birchall, personal communication, April 7, 2009)

With this clever comment, an interesting thing happened. Other students chimed in, mentioning their liking for IKEA, some adding that they would like to see IKEA stores in their locations. It is unclear what makes members of the general public, graduate students, and professional scholars alike think this is not precisely what happens all over the world: "I like McDonald's. We should get one here." McDonald's (and similar corporate entities, of course) thrives in other places because the people there like it. They spend their money there, and the business becomes successful. It does not make the people, or by extension, their culture, American, and they are also perfectly capable of determining whether or not they care to frequent the novel franchise or continue to go to the local restaurants to which they are accustomed. Frankly, it is far more disrespectful of people in other parts of the world to imply they are incapable of making their own consumer decisions than it is for American companies and multinationals to offer local consumers novel options with which westerners might not agree. As noted before, this is not to say that globalization, or large corporations, or trade, are "good." It is simply to say that the ultimate act of disrespect toward people in other parts of the world (developing and otherwise) is to take away their own choices about their own habits and preferences, particularly in assuming they should not be offered those choices because they will not understand what the proper things for them to do with those choices are with regard to their own cultures.

Additionally, living cultures are not uniform, even those altered by deliberate conquest. Traditions, languages, sensibilities and tastes survive. Different people in different parts of the same country eat different foods, celebrate holidays differently, have different dialects, and identify themselves by region, or town, or even family or neighborhood—not just by country. Consider the United States. Even leaving aside its diverse immigrant and ethnic populations, someone who works a farm in rural Wyoming is living in a rather different culture from someone who works in the high-tech industry around Boston, and both of them would likely feel out of place in Los Angeles or Tallahassee, perhaps even for different reasons. This is also the case in countries around the world: cultures are shaped by the people who live in them, and their ways of life, interests, and preferences, of which there may be dozens, scores, or hundreds in a single country or region. In India, for example, most people speak Hindi, as well as additional separate languages of their regions or states, not to mention different foreign languages. India is incredibly diverse. Any Indian would find the idea that their culture is somehow uniform patently absurd.

How, then, would it be possible to make a nation or region that is composed of very diverse eddies of cultures, even within itself, suddenly become homogenous with an outside one? Even if it were done on purpose, each culture would have to be induced in its own special way—which already precludes true homogenization. People and their cultures are not homogenous, even when they all prefer similar things or do certain things in similar ways. They are complex, and another culture cannot be dropped into place around them and suddenly take over completely. People will still choose the things they prefer. Cultures and people are not homogenous from within. They cannot be made so from without.

The Nature of Saturation Points and Systemic Equilibrium

Finally, phenomena do reach their saturation points, from biological populations to the motion of catamarans to absorption of cultural values. When one spills a glass of milk, the spill can only spread so far. Then it must stop spreading, reaching a new state of equilibrium as a puddle, contained by such factors as volume and surface tension. It will then begin to contract again, with evaporation. It does not continue to spread *ad infinitum* until it is shallower than a molecule thick, and then spread itself upon the breeze, contaminating all it contacts with lactose. It reaches a saturation point in its motion, it can go no further, and it stops. A forest fire can only spread as far as it has fuel to consume, which is why the technique of starting a backfire works: firefighters start a smaller fire in front of an advancing forest fire, effectively removing any fuel and stopping the larger fire. Even without a backfire, a fire stops when it runs out of fuel, cannot make the leap from one source of fuel to another because of distance, or when it has saturated its area, and it too begins to recede. Nothing spreads indefinitely—not milk, not fire, not cultural domination—everything has a saturation point.

What happens to a more complex system when it reaches a saturation point, then? Other factors in the system, which were present all along, often come to the fore, and if the system is stable or contained enough, will usually nudge it back toward equilibrium. Take for example the catamaran. The additional hull is a hedge against the boat tipping over. The higher it lifts up out of the water, the stronger the gravitational pull back down. It is not merely a matter of, “what goes up must come down,” but of the “going up” part of the system actively setting the “coming down” into motion, and indeed, feeding it.

Let us consider a slightly more complex system—a biological one, composed of foxes, rabbits, and lettuce. (For a more detailed discussion of modeling behaviors of complex biological systems, see Gleick, 2008, beginning on p. 70.) When the lettuce has a good year, perhaps producing a bumper crop, the rabbits feeding on it also dramatically increase in population and vitality. The foxes have a rough year trying to catch all the strong, fast rabbits. When the foxes have too rough a year, though, there aren't enough foxes to cull the growing rabbit population—particularly the sick and aging ones, as they are easiest to catch. The quality of the rabbit population suffers for not being culled, and the next year's lettuce population cannot support the growing, hungry rabbit population. The rabbits begin to die off. With the rabbits weakened by hunger, age and other problems, the foxes begin to have an easier time catching them, and the foxes have a much better year. Additionally, with an increased mortality rate among rabbits, and therefore more rabbit carcasses, the soil is better fertilized, bringing the lettuce population much-needed nutrients, particularly after the population had been decimated. The following year, the lettuce has a comeback.

The cycle may not necessarily repeat itself in the same way, or even at all, but the change in each population affects the others, and approaching saturation points bring the system back toward equilibrium. Once the rabbits are doing well, they do not then take over the entire ecological niche, making it homogenously all-rabbit. For one thing, the population would die off without the lettuce to feed upon and the foxes to keep the populations and systems in functional equilibrium—and long before the population could become all-rabbit. Rather, that population reaches toward equilibrium, in balance with the lettuce and fox population. A system out of balance often reaches toward a new equilibrium, even if it never quite reaches a steady state.

So it is with culture. People stop consuming when they stop being interested, or they have had enough, or they do not appreciate a particular extra-cultural influence that they see as invasive or destructive—they resist. They resist relinquishing the things they deem more important than novelty, much like the companion hull of a catamaran resists being airborne, driven back to its point of preferred equilibrium by the very motion of novelty itself. People are pulled back to the familiar things they value like gravity pulls the hull.

Sometimes they choose things they consider improvements, creating a new equilibrium, but that doesn't necessarily harm the larger culture either. For example, if the author were to start pasta dough in a food processor rather than as a pile of flour on a noodle board as some of her immediate ancestors have, that does not mean she has rejected the more traditional technology completely, or that she never uses it anymore, or that she will never teach it to anyone else. It may simply mean that she is running short of time this evening, or that the thought of getting flour under her fingernails today is unappealing. The culture of pasta making, or of her ancestors immigrated from northern Italy, is not dead simply because one small aspect of it now has the option of being slightly more convenient (or, in this case, is perceived as having been improved upon). Further, those recent ancestors would likely have used food processors sometimes, too, if they had had them. The essential cultural value in this case is in taking time to make good food, and then enjoying the good food with others. Shaving the first fifteen minutes off the much longer process doesn't hurt the result, or the larger cultural value. It simply keeps the flour out from under one's fingernails, and perhaps allows one time to start an after-dinner granita, or make a phone call inviting one more loved one to dinner.

Similarly, people do not swallow trends and products as whole cultures. Once everyone has an iPod who wants one, the consumer “trend” does not continue until every single pocket in every single country around the world has an iPod in it (although even then, we would eventually run out of pockets, which are, after all, a finite commodity). When the novelty of a new McDonald’s wears thin, people lose interest, stop going, and business drops off. One side of the catamaran lifts, and is pulled back down by gravity. It does not continue to lift until it takes flight. Cultures reach saturation points with new ideas and influences, which they ultimately adopt or reject, not wholesale, but in segments, communities, and as individuals. Cultures do not become uniformly something else because of outside products or ideas.

Analytical Method: A Suggestion

As it happens, and as has been hinted at throughout this article, the field of nonlinear dynamics offers a number of ways to think about saturation points in biological, mechanical and social systems. We have already been considering some examples throughout, from self-organization and increasing returns to thinking about cultural contact more as a truly global complex system than as a unidirectional line. This is also the true challenge of twenty-first century thought in international relations: shedding the linear mindset that is the legacy of Cold War dichotomous thinking, and instead using intellectual tools that illuminate the nature and dynamics of real-world complex behavior. Now let us consider an example of the behavior of systems and saturation points that we could use to analyze the cultural ones we have been discussing.

There are a number of ways to investigate the motion of saturation in systems such as the global polis. Natural systems, including those based on natural behaviors such as human behavior, behave remarkably similarly to each other—so much so, in fact, that we can take any of the metaphorical examples we have discussed here (bird flocks, traffic jams, forest fires, spilled milk, mammalian endocrine systems, evolution of horses, weather, biological populations, catamarans, market trends, and so on), operationalize them, and gain some insight about their shared nature—and by extension, of globalization, which also shares those similar qualities. How would we go about that, though—how would we even begin?

The common thread in understanding all the various kinds of systems mentioned is in leaving behind the “centralized mindset” discussed earlier, in favor of thinking about self-organizing behavior, as these are all self-organizing systems. Nobody directs any of these things, just as, as previously mentioned, nobody directs the Internet or the antibodies protecting a body from illness. That is the very essence of thinking differently about the nature of global interactions and culture. Nobody directs the weather, or the lettuce-rabbit-fox ecosystem, or the evolutionary path of horses. They are all self-organizing systems, as is globalization itself.

One good way to investigate self-organizing systems is with agent-based modeling. Agent-based modeling uses very simple computer programs to model behavior. The user has a few programmable pieces with which to simulate what can become some very complex behavior: the “agent” or creature, such ants seeking food and letting other ants know where to find the food; the movable objects the creatures act upon, such as the food; and the background, which can be divided into cells that also have their own behavior.

Let us take our example of the forest fire. In his delightful and succinct book *Turtles, Termites, and Traffic Jams*, about decentralized behavior and modeling it with an agent-based modeling tool called StarLogo, Mitchel Resnick specifically considers how to model a forest fire and its fuel saturation. (The book is an excellent introduction to StarLogo, and to agent-based modeling in general.) Using StarLogo and a handful of very brief commands, Resnick programs some patches to be trees and others to be empty. In this way, he investigates how close together the trees have to be (the density of available fuel) for the forest fire to burn from one end to the other. Resnick tells us,

> When the program starts, there is a neat line of red fire on the left edge of the screen. Then the fire spreads from tree to tree. In some places, the fire quickly reaches a dead end, surrounded by empty space. In other places, the fire continues to spread from tree to tree. Overall, the fire paths form fractal-like patterns on the screen. (Resnick, 2001, p. 106)

He is suggesting the nonlinear nature of this system—no surprises there. What insight Resnick does gain about the nature of fuel density and fire saturation is that the fire needs an extreme tree density in order to consume the forest entirely, and still a surprisingly large amount just for the fire to make it from one side of the forest to the other.

What we're most interested in, of course, is the behavior of the system. It doesn't matter if we're talking about a fire consuming trees or an outside culture subsuming others—we want to know about spread and saturation. Whether we're considering trees or individual members of a culture, the spread of fire or cultural products and ideas, spots where there is no tree fuel and fire cannot spread or spots where there is no interest in outside cultural products and ideas and those cannot spread. We would model the behavior in much the same way.

What we may take from Resnick's behavioral study is that, in order for an outside cultural value, or a trend, or a desire for a particular brand of hamburger, to spread so that it consumes a whole culture, the density of fuel—in this case active consumers—is the key. Those consumers must have a considerable density indeed. With Resnick's tree density, even at fifty-five percent, with more than half the forest area being trees, the fire *never once* made it all the way across the screen. Until the density reached a much greater extreme, the fire was never guaranteed to burn its way across the entire forest, but the odds got significantly better after a threshold of sixty-three percent was reached. Still, the fire did not consume the whole at that density.

This suggests that the conditions necessary for the consuming of an entire culture—never mind every one of the cultures of an entire planet—has to do with the density of individuals interested in adopting the outside culture. If that density is not critical, the outside idea or product or value does not catch on, and it is very difficult indeed for the entire culture to be altered, except in the most extreme of circumstances, just as it is difficult for the fire to get enough fuel to prolong its trajectory to the other side of the forest.

It is in this sense that the previously-discussed misconception of homogeneity is so very important, for cultural density is not merely population, but the active members of a particular part of a particular society. They must be homogenous enough for a specific outside idea, product, value, or the like to have enough appeal to spread from one individual to another, and they must be of close enough cultural proximity that the spread can happen—that individuals can introduce that idea, product, or value to each other. If the members of the culture are disparate enough in their own interests and ideas (and, as we have seen, they are), very little will appeal to enough of them that that critical density can be reached. Similarly, if they communicate infrequently with each other, or live in isolated communities (and, as we have seen, many do), that critical density will also not likely be reached.

If we're looking for specific densities necessary for cultural conquest, we may consider the forest fire model as a rough analog. More than half of the members of the existing culture, then, would need to have contiguous access to each other and similar enough tastes for the outside piece of culture to catch on at all, but it still wouldn't catch on through the entire culture. Nearly two-thirds of the contiguous, actively interested existing culture would have to accept the outside piece and pass it on for it to spread through the existing culture—and it still wouldn't subsume the whole. In other words, the study of the behavior suggests that complete subsuming of hundreds of disparate cultures, the vast majority of which are nowhere near each other conceptually or physically, ultimately fails. This is because the cultural acceptance of enough aspects of the outside culture never reaches that critical density that would allow it to subsume others. The world is simply not culturally homogenous or contiguous enough for it to work.

Conclusion

Although many misconceptions exist when considering the complex forces that make up the phenomenon of globalization, the right theoretical tools are a great help in rethinking those misconceptions. The insights we glean from using theoretical tools capable of describing and explaining such complex phenomena are the ones that will help us build useful theory in twenty-first century international relations.

As a start, we can reject constructions relying on dichotomy or dichotomous values, and those that assign moral judgments to self-organizing complex systems. A complex system is merely complex, and unable to be funneled into dichotomies, or to live up to moral judgments as if it were a conscious, decision-making agent. We can use our common sense to ask questions of our scholars and our media to determine what might be missing from their accounts. We can be aware of the temptations to confuse correlation and causality, and to view events in hindsight as an inevitable straight shot, and not succumb to those temptations. We can seek to understand globalized responses to western culture on other peoples' own terms, and understand our own cultures and theirs better for it.

Finally, the west's, and specifically the US's, culture cannot and will not dominate all others. Certain aspects of it will reach an interest saturation point among particular members of particular cultures, based on their own individual interests and values—or perhaps they have already—and stop spreading. Places without the infrastructure to support the components of other spreading cultures are already as saturated as they will be, at least for the foreseeable future. There is also nothing inevitable about the spread of cultures and their values, about the multiple complex phenomena of globalization, or about complex systems in general. The lack of inevitability, however, together with the fact that nobody is directing these phenomena, suggest that globalization is what we make of it, both in our practices, and conceptually—and that the more interconnected we all become, the more powerful and impactful our individual choices are in shaping the global cultural future.

A Multi-Party Imaginary Dialogue about Power and Cybernetics

Phillip Guddemi[1]

Abstract: This paper is written as a multi-sided dialogue intended to present a number of ideas about power. Some of these ideas are my own, expressed in a kind of evolutionary idiom of adaptation though they were partly developed in reaction to Foucault (and are far more indebted to Foucault and cybernetics than to contemporary evolutionist thinking). There is a deep irony in that my way of thinking is primarily rooted in the cybernetic anthropology of Gregory Bateson; however, he was deeply skeptical of the concept of power. My personification of him in this dialogue, as "Bateson," demonstrates this skepticism and brings into the discussion other relevant ideas of his. The third participant in the dialogue, Mary Midgley, is included because her consideration of Hobbes' ideas leads us to consider yet another, probabilistic, way of thinking about power.

Keywords: Adaptation, epistemology, power

The following is a multi-sided dialogue[2] *imagined as being between various persons who have been and remain influential within my own evolving thought about power. My ideas have roots in the cybernetic anthropology of Gregory Bateson; however, he was deeply skeptical of the concept of power. My personification of him in this dialogue, as "Bateson," demonstrates this skepticism and brings into the discussion other relevant ideas of his. In counterpoint to his views (which can be documented as his or as having been prefigured by his), my own persona in this dialogue articulates evolving aspects of my own thought which relate to concepts of competition, status, and risk. The only other participant is Mary Midgley who brings into the discussion her unique perspective on the political thought of Hobbes.*

Bateson: Not everyone feels that the concept of "power" needs re-examination. Most people, perhaps, are fairly satisfied with it, and not merely in the "political" sphere. I got very discontented with the way certain people were using the concept of power in the family therapy business. For example Jay Haley, the family therapist who was a coauthor with me of a paper about schizophrenia, used to postulate that every participant in a family system was engaged in a struggle for "power."[3] And the entire movement which calls itself "neuro-linguistic

SOME RIGHTS RESERVED

programming" seems to be based on ideas of power and control. I stopped sending people to study Milton Erickson's techniques of hypnosis after finding out that they so often seemed to come back "craving for power."[4]

It's ironic that Norbert Weiner called cybernetics the study of *control* and communication.[5] Because if cybernetics teaches anything, it is that our control, over what we like to call our "environment," is radically limited. Each of us is only *part* of whatever system it is we are participating in.

There is a certain scientific *hubris* about control which I reacted against. It goes with ideas of linear cause. We find the cause and we can obtain the effect, assuming that the effect is something that we want. Effects we don't want we call "side effects" or "unintended consequences," and then we work on minimizing those. But they are precisely what we don't want to think about, so we don't, until we have to. Therefore we are always running faster and faster to mitigate the effects of our previous interventions. The world is always falsifying our simplified versions of it, but we simplify because it is the only way to "get things done."

So what we think of as our control over the world, and over others, is always limited. But over and above that, "power" has problems as an explanatory principle. I had always warned against "power" as well as "energy" as being quantitative metaphors about qualitative things, not applicable to the world I call "creatura," the world of biology and communication that operates on cybernetic principles rather than according to billiard-ball physics. And of course power has a meaning in that world, as does energy—and in our veneration of physics, which comes from our success (or apparent success) in controlling our physical world, we naturally apply ideas from physics to living systems in ways that don't make sense. With energy, for example, we have psychic energy, which to me is a false metaphor for that reason. Similarly we have Freud's hydraulic system of the self—maybe that's been largely forgotten these days, good riddance, though there was a lot else in Freud that's been thrown out with the bathwater…

There is another point about power, which is that you are always yourself autonomous, or as Maturana and Varela put it, autopoietic. Or as I often put it, your energy comes from your own breakfast. If you kick a ball, the energy of the ball is transferred from your foot to the ball, but if you kick a dog, the dog just might bite you back, because the dog has its own source of energy, which we call its metabolism. It is autonomous in that sense.[6] Foucault, who has been cited in the service of a lot of nonsense using the word power, actually said that power is always a relation between beings (people, but I think his analysis works for animals too) who are mutually autonomous in this way. He calls it "action upon the action of others,"[7] but what this means is that you as the less powerful one are still responsible for your own actions, and the more powerful people are there in your environment and you are making choices about how to deal with them. But see, the opposite is true too—you are in their environment, and they are making choices as to how to deal with you. There is no unilineal power.

[7] Foucault (1982, p. 428).

Near the end of my life, I set a challenge to cybernetic thinkers of the future. I did this in a little-known conference devoted to what it means to be a "power broker." It was a conference about an urban planner in New York named Robert Moses, but really, my thoughts were not specific to him. I challenged that conference to "try to spell out in terms of patterns of interaction in real time what the metaphor 'power' really denotes – a re-examination of the basic premises of political science in the light of cybernetics."[8]

Phillip: So let me try to take up this challenge, as I have done in a 2004 conference in Copenhagen,[9] in an article for *Cybernetics and Human Knowing*,[10] and in a recent presentation for the systems theorists on Foucault.[11]

Put in an evolutionary frame, the key idea I want to develop is very simple. All organisms live in and adapt to an environment. For social animals, among the most important constituents of that environment are other animals of the same species. Power, or if you like, social power, comes from this simple picture. We say that A has power over B if B is adapting to A more than A is adapting to B. Really I don't know why this formulation has not come about sooner.

I suspect the reason it hasn't is that conventional theories of power seem to look at it from the agency of the power-wielder. Power is seen as some faculty or property or quality inherent in an agent, which enables that agent to *do* things. And indeed what we call power-to can be seen as something which is the *capacity* of an agent. However, I find that power-over, or social power, can more fruitfully be seen from the point of view of the adapting person (or organism), the one who is "underneath." This transformation is similar to that in reader-response theories of authorship, and it can be shown to be inherent in second-order cybernetics and in constructivism.

It turns out that power, which is a heterogeneous thing when it is looked at from the perspective of "what sorts of things make the powerful powerful," finds a kind of conceptual unity if it is seen instead as that to which the less powerful *adapt*. This adaptation can be unconscious or automatic or it can be quite conscious and strategic. Adaptation in this kind always is done by an *autonomous* agent of the type which Bateson talked about, and indeed Foucault made a similar point.[12] And since we are always adapting to each other, we are by this definition or conception also always exerting power over each other—a concept which fits well with a kind of Foucaultian capillary concept of power. But clearly some people exert more power over others than others do, and we can see this as similar to gravity. Gravity is a force exerted by all matter on all other matter, but depending on the mass of the objects, the gravitational pull of A on B may far exceed the gravitational pull of B on A. So why not the same for power? The power of A over B exists to the extent that B's adaptation to A is more than A's adaptation to B.

[10] Guddemi (2006)

[11] Guddemi (2008)

[12] Foucault's point:

> Power is exercised only over free subjects, and only insofar as they are free. By this we mean individual or collective subjects who are faced with a field of possibilities in which several ways of behaving, several reactions and diverse comportments, may be realized. Where the determining factors saturate the whole, there is no relationship of power; slavery is not a power relationship when man is in chains. (In this case it is a question of a physical relationship of constraint.). (Foucault 1982, p. 428)

Bateson: But what is this "more than"? Such a concept of power imposes a quantitative metric on phenomena that are not always quantitative. Ever since the triumph of quantitative science we have lost the knack of looking at patterns.

Power in this sense is a human construction rather like money. These are unbiological ideas, and they distort our experience as biological organisms. In the world of biology it is not true that more is better. It is a world of optimizing not maximizing. You have to have just the right amount of hormone in the right place in the developing body, not too little, not too much. The same with other quantitative things—as I wrote, protein, oxygen, sex, warmth, entertainment, water, air[13] —maybe even money. Or "power."

But money is something of which we assume that the more we have of it the better off we are. And we make the same assumption about power. These are cultural assumptions and they are among the precise ones which are helping us destroy the planet.

Here is another example of a related construction, which we have now imposed on the helpless brute animals: "dominance." We have this whole idea that social mammals impose on each other a rank order such as our own societies have had. But this is now being challenged by some of the primatologists themselves. Bruno Latour has mentioned in his work[14] the baboon studies of Shirley Strum, who demonstrated a new way of looking at baboons, male baboons no less. She simply denies that they have a dominance hierarchy, certainly not one based on aggression.[15] Instead, like us baboons use social skill, reciprocity, and cooperation, though aggression is part of the mix as well. And no one should be surprised at this, but we are. Because we have a protocol to place baboons in a "dominance" rank order, and because this protocol works for us (in ways which provide a kind of self-confirmation), we assume that the protocol describes what the baboons are doing, but Shirley Strum says no.[16]

Mary Midgley: I believe our culture's concept of power can be seen in Hobbes, the 17th Century political thinker. "So that in the first place, I put for a general inclination of all Mankind, a perpetual and restless desire for power after power, that ceaseth only in Death. And the cause of this is not always that a man hopes for a more intensive delight than he has already attained to: or that he cannot be content with a moderate power: but because he cannot assure the power and means to live well, which he hath present, without the acquisition of more (Hobbes, *Leviathan*, Pt. 1, Ch. 11)."[17]

---

[13] Bateson (1974, p. 27)

[14] Latour (2005, p. 69)

[15] Strum (1987, p. 157) cited in Latour, above.

[16] Strum's skepticism about dominance order in primates was prefigured, in my opinion, by Bateson's skepticism about transitive order in biological systems generally. With respect to human power relations he reiterated this skepticism in his 1974 draft paper, *op cit.*, pp. 26-27.

[17] Midgley (1978, p. 8)

Marshall Sahlins has recently argued that this is “the Western illusion of human nature.” And he makes a good case that it is a longstanding folk belief going back to Thucydides and even earlier, that we are innately competitive and avaricious. He doesn’t see other cultures as having made this assumption, or having come to this conclusion.[18]

But I am interested in the Hobbes quote because of the way he shows power to be an insurance.[19] In our societies we amass money and power because we want them to buffer things that might happen to us later. This is how the desire for money and power becomes boundless.

We can distinguish the desire for enough, from the desire always to be certain of having enough. Recent work on happiness shows that it increases along with income up to a certain point, and then after that point there is far less correlation between income and reported happiness.[20] We can think of that point as the “enough” point of any particular society. Hunter-gatherers, as another example, when they supplement their subsistence style with working for pay, will often work just as much as necessary to get what they want, and then they will stop, with little to induce them back to work. It takes a social transformation for them to feel that they need more.[21]

But this is exactly what Hobbes is saying with respect to power. The desire for power, like that for money, doesn’t come from wanting more happiness or fulfillment in the present. A limited amount of money, or power, would suffice for these, and Hobbes as much as admits that. The desire for more, whether this is money or power, comes from fear or anxiety about possible loss. If one could always insure against everything that might happen, one could maybe relax in the present. However, there is always some other unlikely event that could happen. We accumulate and accumulate, both money and what we perceive as “power,” in hopes that we can thereby defend against all the possibilities that might threaten us, and yet each further accumulation comes with its own associated vulnerability, so that we are always in fear and never truly enjoy what it is we have accumulated.

Phillip: This insurance concept could provide us with a possible metric for power, although I don’t think this has been done. Power could be measured as a derivative expression based in probability, just as we find in *insurance* itself. Life is full of uncertainties but each of these uncertainties has a particular probability. If I can decrease the probability of something I don’t want happening to me, I will do that. I can decrease my risk. But in a social world I can often do that by increasing yours. It is not *always* as zero-sum as that, but it *can* be.

Robert Sapolsky has studied status hierarchies among baboons[22] and Michael Marmot has studied them among human beings.[23] Even granting what Shirley Strum has to say about the self-confirming aspects of dominance theory, there is still a difference in the very bloodstreams of baboons who occupy different social places, whether you prefer to call these effects of dominance or not. Status in your group counts; the lives of those lower in status are more chaotic than that of those higher up. This can be the doing of the higher-ups themselves, for example if they bully the lower-downs. "Stress" is less at the top and more at the bottom, precisely because those at the top experience fewer perturbations and fewer risks.

---

[18] Sahlins (2008)
[19] Midgley (1978)
[20] Layard (2005)
[21] Bird-David, Nurit (1992)
[22] Sapolsky (2004)
[23] Marmot (2004)

So a possible metric of power could be about comparative insulation from risk. However, as Ulrich Beck shows in his work on the risk society, this is not always easy to ensure in our changing society, in which previously unknown risks emerge all the time.

Still, if you look at those at the bottom of social hierarchies, you will see that *in general* they undergo more risks with less buffering, they have to adapt to more, and they have fewer resources with which to do this.

Bateson: "Stress" is another of those physical metaphors for biological realities. In *Mind and Nature* I define it as follows: "Lack of entropy, a condition arising when the external environment or internal sickness makes excessive or contradictory demands on an organism's ability to adjust. The organism lacks and needs *flexibility*, having used up its available uncommitted alternatives."[24]

Stress is the result of double binds, and for me double binds are the result of adaptation which is challenged. You are perfectly adapted to one thing and another thing comes along which makes your earlier adapted behavior "wrong."[25] Over time if you are stably adapted to one thing, because it is always there in your particular environment, then you will tend to hard-wire your response to it. As with practicing the piano, or any skill, eventually your knowledge proceeds to more and more unconscious levels of the mind. But when something that deeply learned starts to be "punished" in some way, due to some changes in your relationship to others, for example other people, then you will experience, at minimum, psychological pain.

Phillip: And it seems that people above others in hierarchies are able to keep those below in just that kind of uncertainty. This is part of the "risk society" which is a phrase that comes from Ulrich Beck.[26] The higher-ups experience a certain buffering of the demands of the environment, while the lower-downs have to adapt not only to the ambient environment but also to the activities of the higher-ups. Risk is transferred to those least able to bear it, and power is the mechanism for how this is done. Maturana and Varela refer to the "perturbations" of the environment[27], but people make their own perturbations for each other, which they experience as "stress." Power is the measure and mechanism for how some experience more stress than they cause, and others cause more stress than they experience.

Bateson: No, this makes power into a dormitive principle.[28] If you want to say power is *itself* this transference of risk, or stress, that is one thing; but you are making just pretty phrases if you call it a mechanism. You are adding a black box you don't need. Say instead that bullying is the mechanism, or rational persuasion (in the sense of how a robber with a gun rationally persuades you to give him your money).

---

[24] Bateson (1979, p. 253)

[25] The discussion of double bind here is an extension of the argument in the following: Bateson, G. (1978), The Birth of a Matrix, or Double Bind and Epistemology. In Bateson (1991, pp. 191-214).

[26] Beck (1992)

[27] Maturana and Varela (1992)

[28] For "dormitive principle" or rather "dormitive explanation," see Bateson (1979, p. 95).

Also I think that the double bind is not restricted to people who have to cope with a stressful environment, even if it is other people who do so much to make it stressful. In fact I think that the classic double bind that I described in relation to schizophrenia, is more especially experienced by people whose environment has changed from a stability it used to have, to a new situation in which their old adaptations are maladaptive. In the evolutionary context this is the prelude to extinction. But those who endure in their lives a relatively stable exploitation full of suffering may not be experiencing so many double binds, in spite of a miserable existence.

Phillip: Maybe the lower-downs experience a loss of possible efficiency in their adaptation, incurring a kind of cost to their bodies and even their minds from having to deal with perturbations outside their control. But they may get a kind of flexibility from this, in that they have less to lose when big changes happen. This seems to relate to what these days is fashionable to call privilege.[29] You have privilege when you have such a good adaptation to the way things are that you don't have to think about it, which in Bateson's terms means you can "hard-wire" it, while others have to be more conscious about factors in their environment which you can rely on more than they can. But this relative privilege is also the prelude to a classic double bind for the privileged, when the underlying environment shifts. They are more adapted to stable situations but less so to changes.

In human terms this looks like a kind of comeuppance for people who have been living it up like feudal lords, or Wall Street. But in ecological terms this analogous dynamic is more obviously sad. The animals and plants of the tropical rainforests have had a stable environment for millions of years in which to develop very special adaptations which could only have emerged due to that relative stability. The perturbations we humans introduce as we destroy these tropical rainforests challenge the "privilege" of these specialized organisms, while our activities "reward" organisms which can adapt to a variety of changing ecosystems, such as rodents, weeds, and cockroaches.

In evolutionary biology there is the concept of fitness. But fitness measures adaptation against some theoretical optimum with respect to an environment—as if the environment itself was not changing. Of course environments do change, and most especially when they are composed of one's fellow humans.

Bateson: I can see a problem with your use of hierarchies as a metric for power though. What about a newborn baby? The moment that baby comes into a family, the parents have to adapt to that new baby—their whole world changes. Freud used to refer to "His Majesty the Baby."

So the point I want to make is again, against this whole idea of a metric for power. Is there a metric that will capture both the power of the parents to determine the basic environment for the baby, and also the power of the baby totally to transform the lives of these same parents?

---

[29] In a talk before the American Society for Cybernetics conference at Urbana, Illinois, in 2007, entitled "Do Power and Privilege without Responsibility Make You Stupid?"

And it is not so different for politicians. They have to adapt to what the people want, to a great extent. For example, Goebbels, in Nazi Germany…[30]

Phillip: I'm going to interrupt you here. I'm not sure I like that example so well. But it's true that the "adaptive landscape" of any leader is composed of that leader's followers. Some followers are more equal than others in this respect, such as lobbyists for powerful businesses. But no leader can lead without followers, and leaders who try to articulate a personal vision beyond what their people are ready for, can get into trouble.

I am willing to say that the people have power against the rulers. But here is the thing. Even among animals, an alpha needs subordinates to be an alpha—but an alpha may disregard a *particular* subordinate more than that subordinate can disregard its *particular* alpha.

Bateson: But what I was getting at was the idea that there are indeed *types* of power. In my presentation for the conference on "Broken Power" I used the metaphor of the parts of a play. Or, as a similarly dramaturgical example, the courtroom. The judge has one type of power, the jury another, the attorneys yet another, and the security guard for the court building, yet another. Like an ecological system, composed of relations between predators and prey, each of which has an evolving and changing role, and each of which continually adapts to the other.

I said there that "Perhaps the nearest 'reality' to the metaphoric myth of 'power' is a large or important part in an ecosystem."[31] An ecosystem is a whole in which no individual organism, or even species, has control over that whole. Particular plants and animals demonstrate themselves as being important within the larger system – but they are not determining the operations of that system in a linear way. Similarly, the powerful in society are not, after all, independent variables which determine the less powerful, in the way that independent variables in science are analyzed to determine dependent variables.

It's true we like to think of our power that way, for example for parents vis-à-vis the children who dominate their lives. This is the idea of the "blank slate," you know. By the way it's a total nonsense to assume that I, or Margaret Mead, or any of those people, thought that power worked that way. It wasn't anthropologists in our day who thought that cultural change was easy, that you could just impose it as a blank slate on people.[32] That was the dream of control in our generation, but you saw it more in psychology, like B.F. Skinner. If you look at my work you find it was always against putting people (or even animals) in Skinner boxes.

You came to me years ago with some idea of making your own major in college—you could do that then, at U.C. Santa Cruz. You wanted to write a major in "cultural planning." Anyway, I told you that you should definitely do that, you know. You should work at trying to figure how to plan culture. But in the end, I told you, you would look at the whole thing and come out with a belly laugh. The belly laugh would come to you because you would eventually realize that cultural planning is impossible. Because, as I told you, "you can't deal with love in that way."

---

[30] Bateson argued famously that even Goebbels, charged with the manipulation of public opinion in Nazi Germany, had to tailor his message to the German people. See Bateson (1972, p. 486).

[31] See Bateson (1974, p. 27).

[32] See Guddemi (2005).

To speak of "love" in any way is somewhat taboo in academia, and I used to relish the shock value in using the term. When I refer to love it is not merely to speak of an emotion, although emotion is certainly part of it. I wanted to counter the idea that cultural change is easy. Our most intimate ways of dealing with each other and our relationships are culturally patterned and punctuated. Changing these is very difficult and facile shortcuts to cultural change, such as those which try to leverage the use of force, are not usually effective. And of course in addition to their ineffectiveness they can hurt people in ways not intended or planned.

Maturana has now taken up the matter of love, and he sees it both as a feeling and as a behavioral foundation for the cooperation that is typical of the human species.[33] As a principle, he sees love as interacting with another as a legitimate other in relationship, as opposed to dominance and power which do not legitimate the other. He contrasts the human care for infants and friendly cooperativeness with the chimpanzee, which he finds to be more "political" than humans in emphasizing dominance and power. Perhaps like the hippies of the 1960s, Maturana seems to see love in this sense as *natural* to human beings.

Phillip: But wouldn't it be true that human beings have at all times been both loving *and* political? Maturana makes an opposition between *Homo sapiens amans* and *Homo sapiens aggressans* but I suspect we have always been both, just as chimpanzees are both, but I think he is right that love is a bigger part of our mix than it is for the chimpanzees. Also I should mention that in some relational views of "power" it is still a factor even in loving relationships, and this accords with most contemporary thought including feminist thought.

A group of cooperative humans, for all that cooperation is based on trust and what Maturana calls love, may have an advantage in fighting another hostile group of humans which has not developed so much cooperation. There you might have love in the service of aggression. Indeed armies cannot fight without the *esprit de corps* which is the fellow feeling, the relational morale, of the soldiers in the armies. The ideology is that it is the hierarchy which creates the effectiveness of armies, but "love" indeed does its part.

On the other hand, when you do have the social breakdown situation that Hobbes describes—and no, I don't believe it is the "state of nature," but it does happen—when you have people split into small groups fighting for supremacy, we tend to believe that it can promote "love"—or at least peace—when one of them decisively wins. That was the idea of the *Pax romanum,* the Roman empire which established such a complete supremacy that, in the provinces, if you decided you didn't care about your sovereignty or rights anymore, you could turn your attention to peaceful pursuits, to the arts of trade for example. (And if you look at trade, you will find both the love and the war within that too.) You could turn your attention away from the question of who wins, admit that the Romans did, and do a few things that didn't involve worrying so intensely about who was on top. (And of course this is exactly what Hobbes advocated.)

I don't recommend this idea to today's would-be imperialists however—even those who want to impose "democracy" (promote love by means of war, which is what doesn't work). What is now called asymmetrical warfare means that small groups can disrupt big societies, and something like the *Pax Romanum* is no longer possible, because the little dogs no longer admit defeat and they can always disrupt what the big dogs want to do.

---

[33] Maturana, Verden-Zoller, and Bunnell (2008)

The idea I am putting forth, to look at who is adapting to whom, represents, I suspect, a departure from a traditional concept of power. It does not arise from the figure of the dominant patriarch or alpha who, as we like to think, has desires and uses his agency to fulfill them. I suspect this figure is the origin of our imaginary—our mental picture we see when we use the word power. Blake called him Nobodaddy—nobody's daddy, whom we imagine as everybody's. A figure to be envied, or not. A pinnacle of a status hierarchy.

Things have gotten too serious to have such a frivolous image of the landscape of power in which we live. To have before us on our minds above all else the question of who gets what, in the short run at least. (Though it is frightening to look at any English dictionary and note the pages and pages which have to be devoted to the verb "to get.") Nor am I trying to argue this on behalf of the temporary kings of the mountain, who will hold that position briefly enough in terms of the time scales we as humans are now in a position to affect.

Power is not a possession, but a summary term of a complex relational configuration of events subject to continual change. We need to recognize that we are mutually embedded in and with each other, involved in webs of circular cause. All of us unavoidably adapt to each other all the time, creating by our mutual adjustments a sort of shifting landscape of mutual influence or power, in which unilateral control is impossible. However, wise action may be possible, and perhaps new metaphors of power can help.

Bateson: In my position paper for the "Broken Power" conference, I mentioned a number of partial meanings of the "power" metaphor, a number of phenomena which "power" is invoked to explain. One of these was "scope, in either time or space." We would hope that enlarging the scope of our understanding would empower us. Indeed, I noted that "'power,' when scope is large, begins to approximate 'wisdom.' But wisdom crieth out in the house tops and no man regardeth?"[34]

I hope that a re-examination of the premises of the concept of power, can bring forth wisdom. In spite of the tendency of wisdom to be disregarded even when it cries out in the streets, perhaps in these times we are searching it out.

The Power of Balance: Transforming Self, Society, and Scientific Inquiry

William R. Torbert[1]

Editor's Introduction: We feel privileged to republish portions of *The Power of Balance: Transforming Self, Society, and Scientific Inquiry*. Originally published by SAGE in 1991, the book's copyright has reverted to the author, who wished to share our selection of excerpts as a contribution to this special issue's theme. Torbert's body of work has always been about fostering "the development of politics and the political," at each of the scales highlighted in the book's title, as well as in all of the domains in which he has served. As he wrote in the original preface to the book, the work was 20 years in the making, and now, nearly 20 years after that, we wish for at least some portions of this classic work to be back in circulation.[2]

The "power of balance" as conceived by Torbert represents an integral paradigm of principles, theory, and praxis. Deployed, the paradigm is one that can indeed inform and shape the development of self, society, and scientific inquiry. To explicate that fulsome vision, the book's fifteen chapters develop the themes of three sections: *Theory and Strategy, Heart and Practice,* and *Vision and Method.* Here, we have excerpted from several chapters in *Theory and Strategy,* and from one chapter in *Vision and Method.*

This means, of course, that we present but a small fraction of this integral classic, leaving out all of the rich, in-depth illustrations, including the author's learning practice as he first attempted to enact the principles.

Yet, we hope even this abbreviated form of *The Power of Balance* supports at least two goals: to offer deployable insights and practices for developing politics and the political; and to take root as part of a foundational canon for integral political thought, research, and praxis. How we readers deploy these principles in our own actions will determine the degree to which self, society, and scientific inquiry transform.

Keywords: Action inquiry, developmental psychology, Hobbes, justice, Kant, legitimacy, liberating structures, mutually-enhancing power, Plato, power, power of balance, practices, political principles, Rawls, Rousseau, social justice, social science, transformation.

SOME RIGHTS RESERVED

Chapter 1. Power and Justice

This book proposes that leaders in politics, business, the media, education, and science can exercise an inherently positive kind of power that can be called “the power of balance.” It also proposes that leaders must exercise this “power of balance,” if they are to succeed in generating and sustaining organizations that:

1. empower their members;
2. reliably increase their productivity and legitimacy; and
3. transform appropriately in, and responsibly manage their impact on, turbulent environments.

A further claim is that, whereas other types of power corrupt, and require balancing by one another in order to limit corruption and injustice, the exercise of the power of balance generates increasing self-balancing, increasing personal integrity, increasing institutional efficacy, and increasing social justice.

In the final chapter of my previous book, *Managing the Corporate Dream*, I suggested that leaders must be able to exercise four different types of power. I argued that these must be blended differently at different times, with different people, if they are to succeed in cultivating growth and transformation among individual organizational members and in overall organizational strategies, structures and systems. These four types of power I call “unilateral power,” “diplomatic power,” “logistical power,” and “transforming power.” The ability to exercise and appropriately blend these four different types of power I call “the power of balance.”

In this book, I wish to explore in much greater depth how and why this hypothetical *power of balance* is necessary for achieving personal human fulfillment, for generating reliable organizational productivity under changing conditions, for cultivating social justice, and for conducting a truly informing and responsible social science. I also wish to illustrate in greater depth what the turbulent but dignified experience of personal and organizational search toward the power of balance feels like. For, in order to develop this power, each person, organization, and society must undergo multiple transformations.

We also see societies throughout the world—from the Soviet Union to South Africa—in a kind of turbulence that holds both the promise of constructive transformation and the threat of destructive violence and chaos. On a still larger scale, we see the human world as a whole on the brink of transformation beyond primary reliance on a balance of power among nation states to increasing reliance on international institutions, especially in the area of international finance.

This chapter focuses on several questions about the different types of power, leading toward the question of what kind of power generates constructive transformation. The questions this chapter addresses are:

1. what are the differences among three types of power—unilateral, diplomatic, and logistical?
2. how does each type of power relate to a particular conception of ethics and justice? And,
3. how have political philosophers and administrative theorists before now thought about power and justice?

Unilateral Power

From the first systematic treatise on power of the modern period—Thomas Hobbes' *Leviathan*—to Nobel prize winner Herbert Simon's *Models of Man,* power has most frequently been defined as unilateral—*as the ability to unilaterally and unidirectionally cause the outcomes one wishes.*[2]

Sometimes, as with Hobbes, the ultimate unilateral power is described nakedly as the physical power to kill another. All men are equal, Hobbes tells us, in their ability to kill one another. Hobbes shows us the most primitive position that 'natural man' can assume. The most primitive position is one in which the basic passion to live, along with the narrowly selfish passion to kill others in order to preserve one's own life, rule. Reason is subordinated to these passions. It serves instrumentally to choose the best ways to preserve one's life.

Hobbes draws this picture, not to defend it as necessary, but rather to highlight its futility and the need for transformation. He characterizes life in this state of nature as a “war of all against all” which renders each individual's life “solitary, poor, nasty, brutish, and short.”

The fear of death motivates people to yield their smaller, problematic powers to a common sovereign. This sovereign uses the much greater collective power to secure an order, which however uncomfortable and unfree it may seem in a given instance, protects the people from the 'war of all against all' and death. Hence, by yielding their power to an omnipotent sovereign, people increase their pleasure and reduce their pain (death and the fear of death). They “maximize their utility,” in the more quantitative and less passionate language of later writers—even if the sovereign is extremely dominative and restrictive.

The sovereign must have absolute unilateral power, according to Hobbes, because any separation of powers increases the likelihood of struggle among the powers and hence of civil war and death. Hobbes carried his argument that the sovereign must have absolute power to its logical conclusion. Absolute executive power precludes an independent judiciary. In a true Hobbesian state, the law is what the sovereign says it is and what the sovereign says it means. The law is, by definition, just. There can be no appeal to a natural law, to philosophical principles, or to a Supreme Court beyond the sovereign, for such appeal undermines the absolute power of the sovereign. In a sense, then, Hobbes presents a philosophical justification for the view that “might makes right.”[3]

Writing amidst the English civil war and the beheading of Charles I during the mid-17th century, Hobbes could find immediate experiential validation for his concern. But to us Hobbes' position almost certainly sounds extreme, perhaps even crude. If this position seemed realistic in mid-17th century England, it hardly seems applicable to late 20th century America. In fact, however, our city streets sometimes closely mirror Hobbes' state of nature. Today, as I write this, the lead article in *The Boston Globe* begins as follows:

> It was growing dark on a recent winter afternoon when the frightening news swept through a local youth program: the van that usually drove the teen-agers home had broken down. A terrified silence blanketed the room as youths realized that they might have to walk home along the darkened city streets.
>
> “A kid came to me in a total panic,” said Laval Brown, program coordinator of the Dorchester Youth Collaborative. “He was terrified. He said, 'I can't walk home, I just can't walk home. Someone got killed on my street. I'll get killed too.”
>
> The youth made it home, running all the way. But in the last eight days, three young men did not make it home alive and a fourth was fatally shot through the window of his mother's apartment. And the city's children know it. They know that at a time of mind-bending violence they cannot entirely be children on the city's streets, that they must surrender some of their freedoms to preserve their lives.
>
> Instead, they live by rules no adult ever taught them and recognize boundaries that are on no city map.
>
> “There're just certain places you don't go,” explained Brian McKinney, 16, a rangy figure standing on a small porch above an abandoned lot in Dorchester. “You don't take no shortcuts, ever, 'cause people be waiting for you. Sometimes you alternate your route on the way home. Myself, I try not to know a lot of people. You can't trust 'em.”[4]

“I try not to know a lot of people. You can't trust 'em.” Obviously, a realistic approach to life under conditions such as those just described; obviously, too, a dreadfully impoverished approach to life. Surely, we wish to say, there must be more to social life than this! Yet before we explore how this may be so, we must briefly acknowledge the vast arenas of human experience that are today characterized by such conditions and such a worldview. To take just two examples: whole countries—most notably Colombia—are deeply influenced by the corruption and violence explicitly cultivated by drug cartels and individual drug barons; also, whole countries—most notably Iraq and its president Saddam Hussein—operate in terms of unilateral, threat power both outside (Hussein has threatened to “scorch half of Israel” with weapons of mass destruction) and inside (depopulation of the Kurdish minority and the death penalty for 'insulting' the president). As I make my final revisions, Iraq has just completed the blitzkrieg takeover of Kuwait.

An Ethical System Consistent with Unilateral Power

“Might makes right” and the fear that controls behavior under such conditions is not ordinarily viewed as a serious ethical theory, but rather as the antithesis of ethics. An ethical perspective is usually thought of as providing a basis for decisions other than one's initial desires and fears. Certainly, Rousseau, Kant, and Rawls (whose views on power, justice, and ethics will be considered below) do not view might as inherently right. Indeed, we will see Rousseau argue precisely that might *cannot* make right.

There is one ethical theory, however, that corresponds closely to the Hobbesian perspective on power. This is utilitarianism. I have already hinted at this correspondence between Hobbesian might and utilitarian right in writing of people's choice to yield power to a sovereign as increasing their utility.

In utilitarian ethical theory, the right or just decision is that which generates the greatest good for the greatest number. The good is that which increases pleasure and reduces pain for each. To maximize pleasure and to minimize pain is to maximize utility. In this theory, rationality is defined as the instrumental calculation of how to maximize utility—how to satisfy desires, *not* as a criterion for judging the worthiness of one's desires). This is one of the principal correspondences between the Hobbesian theory of power and the utilitarian theory of justice—that both explicitly treat desires as ends and reason as a subordinate, calculative means.

Given this correspondence, the correspondence already hinted at follows. Hobbesian political theory can be restated in utilitarian terms as:

1. the fear of death and the likelihood of actual death are infinitely more painful than any other deprivations; hence,
2. the pleasure of their attenuation by means of the Hobbesian sovereign will outweigh any finite pains the sovereign's particular decisions may inflict.

Because we ordinarily associate utilitarianism with neo-classical economic theory—laissez-faire market theory in particular—and because such economic theory is ordinarily thought to emphasize state interference in individual decision-making, the overall correspondence between utilitarianism and Hobbes is not immediately obvious. But, as draconian as the Hobbesian power equation sounds, it does not require a sovereign who is absolutely dictatorial in all decisions. Thus, the Hobbesian sovereign could choose to cultivate a vigorous market system within a larger framework of executive prerogative.

Over the past generation, Prime Minister Lee Kwan Yew of Singapore may have best exemplified such a correlation of unilateral executive power and utilitarianism. On the one hand, there are real questions about the degree of personal, media, and judiciary independence of expression in Singapore; on the other hand, there is no question about the support for a market economy in Singapore. In 1990, Brazil's new president, Fernando Collor de Mello, is making a similar attempt: to use a strong authoritative initiative, in the form of a “shocking” economic plan, to stop inflation and create a more market-regulated economy.

The deepest correspondence between the Hobbesian perspective on power and the utilitarian perspective on economics, ethics, and justice is that both perspectives *implicitly* require a kind of rationality that weighs, compares, and organizes desires, rather than merely calculating how best to achieve them. How the Hobbesian perspective does this is clearest and most nearly explicit. Simply put, in his theory the omnipotent power of the sovereign is based on a rational contract to which people's desires are henceforward subordinate. Insofar as such a contract is adhered to, such adherence represents the victory of constructive, framing, long-term reasoning over immediate desires abetted by instrumental, calculative, short-term reasoning.

That utilitarian theory also implicitly requires an omnitient, rational sovereign who organizes the relations among desires is less obvious. Nevertheless, it does. For, in order to calculate the greatest good for the greatest number, one must assume that both individuals and society have a rational capacity that reduces all qualitatively different pains and pleasures (e.g. hunger and loneliness, or chocolate, oat bran, and hearing God's voice) to a comparable, quantitative scale (a lowest common denominator).[5]

In his early book, *The Theory of Moral Sentiments*, Adam Smith explicitly describes such a self-regulating inner observer (he called it “the man within the breast”) as existing within each individual. A careful reading, however, shows that Smith is inconsistent: he also recognizes at some moments that such a sovereign inner conscience must in fact be explicitly constituted by each individual and that few individuals actually engage in the work of constituting such a conscience.[6]

Later, Smith would describe, in *The Wealth of Nations*, how a competitive pricing system generates an efficient quantitative scale for comparisons—a lowest common denominator among otherwise-qualitatively-different values. Just as “the man within the breast” purportedly serves a self-regulating function on the individual level, the “invisible hand” of the market pricing system under competition serves this same self-regulating function socially. But a pricing system cannot determine the definition of what is property; hence, the prevalence of Intellectual Property Committees in major corporations today, and the litigiousness of the software industry. Nor can a pricing system determine the value of money, money-making, and money-saving, as compared to leisure or consumption. That is, a pricing system cannot determine how a person should value his or her time (for example, writing earns me no money; consulting earns me a great deal of money; but I value writing much more than consulting).

The trick is that a pricing system can wonderfully *reflect* how people value time. But if persons are not independent valuers of their own time, guided by self-determined aims, they may fall into believing that price determines action, and they may do what pays most or costs least for that reason alone. So, a pricing system can trick people about their own self-interest, especially if it is defined as the primary rational calculus in decision-making. Indeed, Adam Smith showed that he understood that the “invisible hand” might just as likely mislead persons about their interests as serve those interests.[7]

The United States is a country that holds “consumer sovereignty” and “everybody is entitled to his own opinion” as among its highest individual and social values. People are assumed to be rational in the sense of able to calculate how to satisfy desire, but there is little tolerance for the possibility that personal and social decisions require something more than calculative rationality—that they may require the construction of a framing, regulative rationality that related valued aims to valued actions. Religion fills this need for a regulative framework, if it is felt at all, and religion is typically considered to be non-rational—a matter of personal feeling, faith, preference. One result of this atomistic, utilitarian approach is an energetic, individualistic, entrepreneurial approach to life. Another result is a great deal of internecine among regulative frames (in marriages, organizations, and communities) that people do not regard as being rationally resolvable and that they consequently do not cultivate the skills or proclivities to resolve directly.

If there is in fact a strong correspondence between the utilitarian orientation and the exercise of unilateral power, as suggested in this section, we would expect people in this country to resort to the exercise of unilateral power in the face of unresolved conflict. Hence, we would expect a high homicide rate, a high divorce rate, and a hell of a lot of litigation. All these are true of the United States.

Here, it is worth emphasizing that the exercise of unilateral power need not sound like the physical, life-and-death matter that Hobbes makes it out to be. It may just as well appear in the guise of a rational, impersonal, bureaucratic, even scientific phenomenon. Such is the quality of unilateral power in the work of Nobel prize winner Herbert Simon who has been thinking about organizational bureaucracies during the mid-20th century, Simon says, “For the assertion, 'A has power over B', we can substitute the assertion 'A's behavior causes B's behavior.' If we can define the causal relationship, we can define...power. ...[It is] a problem of giving operational meaning to the asymmetry of the relationship between independent and dependent variable.”[8] Again, as with Hobbes, we see power defined as unilateral and unidirectional (asymmetrical). But this time the power may, presumably, be physical force, social attraction, or a cognitive structure such as an organizational chart.

Whether the writer be political scientist Robert Dahl, economist John Kenneth Galbraith, or organizational theorist Jeffrey Pfeffer, this underlying definition of power as causing change in the less powerful, no matter what the will of the less powerful, remains the same.[9] As Pfeffer summarizes, “Most definitions of power include an element indicating that power is the capability of one social actor to overcome resistance in achieving a desired objective or result.”[10]

Indeed, so universally accepted is this element of the definition of power that many readers must be wondering why it merits discussion. Nevertheless, this book *does* contest this element of the definition of power. I do not contend that power *never* has an element of unilateral, unidirectional causation that overcomes resistance. But I do contend that other kinds of power can also be exercised, and that power cannot, therefore, be *defined* as the ability to unilaterally and unidirectionally cause the outcomes one wishes.

Another Approach to Power—Diplomatic Power

The second most common approach to power is, paradoxically, the very reverse of the first approach. In this view, power is generated, not by the power-wielder, but by the power-yielder—by the consent of the governed. A century after Hobbes, and in response to his claims, Rousseau introduced an argument against the notion of power as necessarily unilateral causation and in favor of power as consent. In this version of power, a visible leader is successful in exercising power to the degree that he or she has the diplomatic ability to determine what the governed actually want and to present proposals that will gain their consent.

Rousseau proclaimed at the outset of *The Social Contract*,

> If force creates right, the effect changes with the cause: every force that is greater than the first succeeds to its right. ...But what kind of right is that which perishes when force fails? If we must obey perforce, there is no need to obey because we ought; if we are not forced to obey, we are under no obligation to do so. ...Let us then admit that force does not create right, and we are obliged to obey only legitimate powers.[11]

Rousseau goes on to argue that, since coerced consent yields no obligation, legitimate power can only be founded on unanimous, uncoerced consent.

This is no mere abstruse principle of political philosophy. In business, Chester Barnard, a twentieth century corporate president, states unequivocally, “There is no principle of executive conduct better established in good organizations than that orders will not be issued that cannot or will not be obeyed... To do so destroys authority, discipline, and morale.”[12]

To what kind of social contract would any and all individuals give consent? Only, Rousseau tells us, to an “association which will defend and protect with the whole common force the person and goods of each associate, and in which each, while uniting himself with all, may still obey himself alone, and remain as free as before.”[13]

How is such a condition possible, the reader may well ask. Rousseau's great insight, which inspired Kant in turn, was that a person is free only when obeying his rational will, and that since reason is precisely internally consistent and generalizable, everyone's 'rational will' will be the same. Hence, a state governed by rational will—what Rousseau called the General Will—is a state in which persons are simultaneously united with all and free to do as they wish.

The obvious question is how one discovers what truly constitutes this General Will. As one helpful step, Rousseau offered a conceptual distinction between the rational General Will and another quality that he named the Private Will or the Will of All. The Will of All is the sum total of what people desire irrespective of whether it is rational in the sense of being universalizable. In other words, the Will of All can be a version of utilitarianism or 'consumer sovereignty'—those decisions that generate the maximum pleasure or utility among the concerned population, irrespective of their general rationality or universalizability.

For example, if slavery for some and addiction to drugs or alcohol for many is what gives the most pleasure to the most people, then the organization or state should promote these conditions, *if* the state is guided by this version of the Will of All. But since such conditions abrogate the freedom of some and the rationality of many, they will not be consented to by all, they are not universilizable, and, hence, they do not represent the General Will. More subtly, a democratic assembly may refuse to raise taxes to cover budget deficits, and this action may very well represent the wishes of a majority of citizens, and hence the Will of All, without necessarily representing the General Will.

Another, different version of the Will of All is any claim made by a leader that certain decisions and actions represent the historical spirit or future destiny of a whole people, irrespective of the effect of such decisions and actions on those not included in the definition of that people. Authoritarian leaders like Napoleon, Hitler, Lenin, or a modern corporate chief executive can claim to act in the name of the people, even if a majority opposes them. They can claim, indeed, to be acting on behalf of the General Will, courageously opposing the temporary Will of All, without any clear method for determining whether this is so. In short, this discussion sharpens the question of how one distinguishes the Private Will from the General Will.

Unfortunately, as with Adam Smith's lack of clarity about how to develop an embracing and rational self-observation by “the man within the breast,” Rousseau is equally unsatisfying about how to distinguish the Private Will from the General Will. It was part of his genius to distinguish clearly on a conceptual level between these two types of social will. But it was part of his limit not to provide a practical political method for making this distinction in actual cases.

Nevertheless, the notion that there is a kind of power, derived not from the strength of a power-wielder but rather from the consent of power-yielders, has played a central role both in philosophy and in practical affairs since Rousseau. Thomas Jefferson's words provide the most influential expression of this point of view: “Governments derive their just powers from the consent of the governed.”

Perhaps the most obvious arena in which the Will of All exercises power is the realm of entertainment and the media. The media and entertainment personalities who have the mysterious talent to draw mass attention become the source of far flung enterprises. Their power is based on others' willingness to give them their attention. As one player on the Hollywood scene recently put it, “All of Hollywood is parasitic except for true talent.” In this formulation, true talent represents legitimate authority because it commands the power (and revenues) associated with the willingness of the population at large to attend to it.

This “diplomatic” type of power has something to do with justice or legitimacy as according with the people's will, and something—but something very much less obvious—to do with the rationality of such a will.

A Third Perspective on Power and Justice—Rational, Logistical Power and the Theory of Rights

Kant responded to Rousseau's enunciation of the General Will by concentrating on the rational element in such a will, rather than on the element of consent. In doing so, Kant did not develop a political or managerial method of determining the General Will; instead, he transformed the idea of freedom as obedience to rational will into an ethical injunction for individuals

“Everything in nature works according to laws,” Kant tells us. “Only a rational being has the power to act according to his conception of laws, i.e. according to principles, and thereby has he a will. Since the derivation of actions from laws requires reason, the will is nothing but practical reason.”[14] We are free only when we exercise our rational will, not when we are compelled by irrational desires. Hence, insofar as we have will at all, we will consent to what is rational.

Indeed, in Kant's view, as we can see in the foregoing quotation, not unilateral force, not consent, but reason is power. In Kant, 'reason,' 'power,' 'will,' and 'freedom' all directly imply one another.

Kant's 'Categorical Imperative' enjoins each of us (because he believes that, upon reflection, we will find it the only rational way) to act only in ways that are universilizable. This means to act only as we would wish others to act toward us and only in ways that treat ourselves and other persons as ends (never merely as means).[15] For example, Kant suggests that, following the Categorical Imperative, we would not lie, since we would not wish others to lie to us, and we would not commit suicide, since we would not thereby be treating ourselves as ends. Kant is resolutely puritanical in his devotion to the rational:

> The pure thought of duty and the moral law generally, unmixed with any extraneous addition of empirical inducements, has by the way of reason alone... an influence on the human heart... much more powerful than all other incentives... When a righteous act is represented as being done with a steadfast soul and sundered from all view to any advantage in this or another world, and even under the greatest temptations of need or allurement, it far surpasses and eclipses any similar action that was in the least affected by any extraneous incentive; it elevates the soul and inspires the wish to be able to act in this way. Even moderately young children feel this impression, and duties should never be represented to them in any other way.[16]

In this passage, again, we see the identity that Kant makes between reason and power, even in interpersonal relations between adults and children. The resulting political vision is of an ideal 'Kingdom of Ends' (a phrase that Kant uses), wherein each citizen is highly independent and free, never coerced, persuaded only by rational argument, and with the right to be treated with the full dignity of an End. In this approach, legitimate or just action is action that procedurally does not violate another's rights; and just laws provide equal protection to all citizens, regardless of race, religion, or sexual preference. Whether or not the action or the law maximizes utility or is voted as desirable is irrelevant to its justice, according to Kant.

For example, most people may be disgusted by consensual acts of homosexual sodomy among adults. Such acts may be regarded as sinful by certain religions. Indeed, the Supreme Court may rule (as it did in Bowers v Hardwick, 1986) that no “right of privacy” protects one against prosecution for such acts.[17] Nevertheless, any law that discriminates by criminalizing such acts only when they involve partners of the same sex is clearly not a universalizable maxim, and violates the Constitutional provision of “equal protection under the law.”

Insofar as we think of power as unilateral coercion or peer pressure to conform to some irrational Will of All, the purely rational Kantian position and procedure appears to abjure the use of power altogether—to treat power and justice as mutually exclusive. As the foregoing quotation demonstrates, Kant did view these other two types of power as illegitimate. But he also viewed them as ineffectual, and this follows from his distinctive view of what power is. Power is the ability to do something rational rather than being caused to do something by internal desire or external pressure.

Hence, from Kant's perspective, real power and true justice are co-terminus. Put differently, for Kant power and authority are co-terminus: real power is invariably authoritative. Whereas the Hobbesian view of power and justice emphasizes the physical, monarchical, executive function; the Rousseauvian view of power and justice emphasizes the emotional, democratic, legislative function; and the Kantian view of power and justice emphasizes the rational, aristocratic, judiciary function.[18]

This overview of the three approaches to power and justice invites us to question whether there is yet another approach to power and justice that combines all three. Historically, of course, we know that an actual social contract—the Constitution of the United States—based on the combination and separation of these three types of power, was constructed at the same time as Kant lived. But this social contract did not, during its first century, embody Kant's Categorical Imperative. It permitted slavery. Not until after the bloodiest of civil wars and the passage of the 14th amendment did the Constitution more nearly represent a successful blending of the three types of power. And not until political philosopher John Rawls published *A Theory of Justice* in 1972 did we have a more or less complete intellectual explication of this fourth approach to power and justice.[19]

Integrating Unilateral, Diplomatic, and Logistical Power

In his description of child rearing in a just society, Rawls exemplifies how the three types of power we have so far reviewed interact with one another. First, he says, the child will learn the "morality of authority." At this stage, parents unilaterally enunciate and enforce rules of conduct. But, according to Rawls, their unilateral power is not absolute and arbitrary. It only becomes authoritative (legitimate) and only has the power to generate moral development toward principled conduct insofar as parents:

1. make just rules;
2. give the reasons for them in an understandable fashion; and
3. enact the rules they enjoin when the rules apply to them as well.

In Rawls' words:

> First, the parents must love the child and be worthy objects of his admiration. In this way they arouse in him a sense of his own value and the desire to become the sort of person that they are. Secondly, they must enunciate clear and intelligible (and of course, justifiable) rules adapted to the child's level of comprehension. In addition they should set out the reasons for these injunctions so far as these can be understood, and they must follow these precepts insofar as they apply to them as well. The parents should exemplify the morality they enjoin, and make explicit its underlying principles as time goes on. Doing this is required not only to arouse the child's inclination to accept these principles at a later time, but also to convey how they are to be interpreted in particular cases.[20]

Obviously, the exercise of unilateral power that Rawls condones in a just society is no mere arbitrary or narrowly selfish use of such power for private or utilitarian ends, irrespective of its impact on others' rights and development. In fact, directly to the contrary, Rawls here advocates a loving and principled use of unilateral power.

Next, Rawls establishes the role for diplomatic power or peer consent in the development of the youth in a just society. As the child becomes a teenager, he or she learns the “morality of association.” Through participation on sports teams, the school newspaper, and other such organizations with peers, the youth begins to mold his or her conduct based more on pleasing equals than on obeying superiors. In Rawls words, again:

> Someone attaining...the morality of association...is concerned to win acceptance for his conduct or aims... While the individual understands the principles of justice, his motive for complying with them, for the time at least, springs largely from his ties of friendship and fellow feeling for others, and his concern for the approbation of the wider society.[21]

These experiences of the proper “morality of authority” and “morality of association” gradually lead the youth to realize that positive experiences are associated with the principles of justice behind the rules obeyed and the approbation received. Hence, gradually, as the youth becomes an adult, he or she makes the rational principles of justice fully explicit and gives them allegiance in their own right. Thus the adult becomes committed to a “morality of principle.” In this way, all three types of power play a role in human development in a just society, according to Rawls, and they do so in a way that reinforces allegiance to the principles of justice from generation to generation.

What are these principles of justice? Rawls formulates two principles of justice that he believes follow from rational reflection. Interestingly and consistently, these two principles themselves reflect all three types of justice associated with the three types of power. His first principle of justice is:

> Each person is to have an equal right to the most extensive total system of equal basic liberties compatible with a similar system of liberty for all.[22]

His second principle of justice is:

> Social and economic inequalities are to be arranged so that they are both: (a) to the greatest benefit of the least advantaged…and (b) attached to offices and positions open to all under conditions of fair equality of opportunity.[23]

Rawls’ first principle of justice is compatible with Kant’s Categorical Imperative. The enunciation of a system of liberties for all emphasizes rationality by the word “system,” emphasizes treating each citizen as an end by the word “liberty,” and emphasizes reciprocality and universilizability by emphasizing that everyone is entitled to this condition.

Rawls’ second principle of justice generates additional conditions that will attract the consent and approbation of citizens and will also generate utilitarian results. Inequalities of position and wealth (to which those with less would not consent, all else being equal) are to be tolerated *only* as these benefit those with less. In other words, a person may consent to receive less income than another, if the additional income motivates the other to become a doctor and cure the less wealthy person. If persons with less income gain greater utility from being healthy than they would from the additional income, they will rationally prefer and choose this condition over that of having equal income but less health. Herewith, Rawls integrates rationality, rights, consent, and utility in his two principles of justice.

The Gap between Theory and Practice — The Difficulty with Doing Rawls Justice

Rawls' work is a theoretical tour de force. Although it has sustained critiques from all angles of the scholarly spectrum, it has proved remarkably robust on a theoretical level. Its Achilles' heel is the question of practice.

There are three problems of practice, of which Rawls solves only one. One problem of practice is: once a just state is created, will its normal practice sustain its citizens' commitment to just outcomes and to maintaining the necessary institutions? This problem of practice Rawls can claim to have solved by showing how children's upbringing in a just society will lead them to adopt a morality of principle and how this principled morality will lead in turn to the two substantive principles of morality he articulates.

The third problem of practice is: given this gap between current practice and just practice, does Rawls' theory provide a vision and method for transforming the relatively unjust and corrupt society into one that is more just and displays greater integrity? The answer to this question is, again, “No.” Although the very explication of his theory may improve legislative, executive, and judicial decision-making, Rawls does not explicitly present that as a process for transforming a relatively unjust society. Nor does he present any other process for transforming a relatively unjust society.

We should, however, pause to consider the efficacy of explicating a robust theory of justice as a method of social change. We see, first of all, that it is a very Kantian approach to social change. Through his theory of justice, Rawls acquaints us with our social duties and provides us with no inducements to act in a just manner other than “the pure thought of duty.” We will recall that according to Kant, “The pure thought of duty and the moral law generally…has by the way of reason alone…an influence on the human heart…much more powerful than all other incentives.” So, explicating a theory of justice can be defended as a method—indeed it can be defended as the *best* method—for influencing a relatively unjust society to become more just.

But Rawls himself does not believe that the explication of principle or theory alone is sufficient to generate justice from generation to generation, even in a society that is already just. As we have seen, he holds that in a just society parents must exercise their unilateral power over children, and youthful friends their diplomatic power over one another, as parts of a long process of cultivating adult personalities that listen and respond to the voice of reason. Moreover, the parents are to love their children and to act consistently with the ideals they preach, if they are to attract their allegiance to those ideals. In short, according to Rawls, much more than the explication of pure reason is necessary to sustain an already just society. Unilateral power, diplomatic power, love, and an awareness of incongruities between one's own reasons and actions (a precondition for developing consistency between one's own principles and practices) are all also necessary.

In a relatively unjust society, the dilemma of how to generate justice must be all the greater. Parents are less likely to be enjoining true principles of justice to their children. They are also less likely to display congruity or integrity—that is, to act consistently with whatever principles they enjoin. Also, friends are less likely to exercise diplomatic power in a manner that reinforces true principles of justice.

Hence, in a less just society, children are likely to experience their parents' power as relatively arbitrary, rather than as conveying a rational and admirable morality of authority. Likewise, youths are likely to experience peer groups as requiring conformity to relatively arbitrary norms, rather than as reinforcing their parents' teachings through a rational and admirable morality of association. And adults are likely to experience organizations where superiors and peers also act in relatively arbitrary and internally inconsistent ways, rather than according to a rational and admirable morality of principle. Socialization of this kind breeds fear, distrust, and disrespect for designated authorities and for peers, as well as low self-esteem and little faith in one's own reason.

Under such conditions, superiors are likely to assert their authority unilaterally and without justification, especially under challenge. Subordinates are likely to consent and conform externally, especially under threat. Reasoned discourse is likely to retreat further and further from the political world into specialist, 'ivory tower' or bureaucratic settings.

To transform such a relatively unjust society—to narrow the gap between the actual and the ideal—requires a kind of power that goes beyond the unilateral, diplomatic, and logistical kinds of power discussed in this chapter. It also requires a conception of justice that goes beyond the utilitarian, consensual, and principled conceptions discussed in this chapter.

The next two chapters introduce the developmental process that persons evolve through if they are to approach the conception and practice of this dynamic, transforming type of power and justice.

Chapter 2. From Political Philosophy to Developmental Psychology

Chapter 1 reviews three distinct conceptions of power and justice, as well as a fourth conception that integrates all of the first three types of power and justice. Starting from the most common definition of power as the unilateral cause of outcomes one desires, we next discussed diplomatic power that attracts others' consent, and then described the logistical power of reason to will what is consistent and right irrespective of inducement and desire. Then, we examined the Constitutional and Rawlsian conception of power and justice as including all of the first three.

We saw that the first two types of power and justice—unilateral power and utilitarian justice, on the one hand, and diplomatic power and consent, on the other hand—are rooted in satisfying desires. By contrast, the second two types of power and justice are rooted in a rational, principled conception of individual rights and socially just relationships.

None of the four approaches to power and justice so far examined explicitly shows how relatively unjust settings can be transformed into more just settings. Yet all of them suggest, at least implicitly, that a key ingredient in the necessary political alchemy of transformation is a constructive rationality—a rationality that frames desire. Hobbes gives us a specific rational contract that is to transform the state of nature into civil society, while claiming that no rational distinctions between less and more just societies are possible once society itself is created. Rousseau conceives of a principle whereby rationality can operate continuously in the generation of social decisions—not just once in an initial contract. Yet he cannot give us any specific laws or institutions through which it works. Kant tells us a specific law—the Categorical Imperative—that a truly rational individual would give himself or herself. Yet he does not tell us how any individual develops this degree of rationality, nor how society as a whole encourages such development, nor how such a general principle is to be applied to concrete and unique circumstances.

It is Rawls who first shows how a just society would organize social institutions and families to encourage the development of principled rationality in new generations. But he does not tell us, anymore than the others, how one can transform a relatively unjust, corrupt society into a more just one.

Surprisingly, it is the most ancient of Western political philosophers—Plato—who tells us most about why power ordinarily corrupts and about a kind of power that generates integrity and justice in conditions where by no means everyone is committed to justice.[1] Early in *The Republic*, Plato introduces a character, Thrasymachus, who argues that “might makes right.” But Thrasymachus is confounded by Socrates' questions. May not sheer strength used unilaterally turn out to have effects different from those initially imagined, Socrates asks. If so, the mighty one will not have succeeded in doing right even from the point of view of achieving his own intention, let alone from any other perspective. For example, by building up German power and starting World War II, Hitler presumably intended anything but his own suicide in a bunker, anything but the governing of Germany by four alien powers, and anything but the creation of the state of Israel.

Not only may there be a great gap between intentions and outcomes, but also between different intentions at different times. Even if Hobbes' sovereign holds all power, his will may not be one across time. Now he exerts power in one direction; now in another. He himself may not recognize the conflict between his different decisions. Nevertheless, gradually, Hobbes' state (or a modern corporation) may begin to lose power as it falls into unintentional inner struggle. In short, unilateral, unidirectional power can generate unintentional effects and system-disintegration over time.

Lord Acton's famous line, “Power tends to corrupt, and absolute power corrupts absolutely,” seems to be based on the intuition that the greater one's unilateral power, the more unbalanced and enslaved to one's irrational desires one becomes, the less one attends to one's effects on others or oneself, and the less effort one makes to guide and limit one's actions according to any criterion of rationality. This process of feeding desire and avoiding the negative feedback that would feed one's awareness gradually reduces one's awareness, responsibility, rational consistency, and moral integrity, until one is absolutely corrupted.

The question arises whether there is a type of power that *increases* awareness, integrity, and justice? Plato answers "Yes."

A Paradigm of Just Action

We can return to Rawls' theory of justice to begin constructing a more dynamic paradigm of just action, for he provides the building blocks to go beyond his own conception. We saw that Rawls argues that, in raising children who will preserve a just society, parents must formulate rules comprehensible to their children, enact a consistent morality themselves, and gradually make the underlying principles explicit. This is an educational paradigm which depends for its felicitous effects on a parental awareness that embraces the realms of intuitive principles, rational rules, their own actions, and their effects on their children, *and that observes and corrects errors and incongruities in translations from one realm to another* (for no one can be expected to get this right to begin with, or once and for all time). I emphasize this last part because it is this dynamic feedback and correction process that must be present if the process is to become increasingly just, and is the process that Rawls misses.

Rawls enunciates an analogous dialectic for each individual in his recital of the primary goods that all rational persons will want, whatever else one or another may want idiosyncratically. He names four primary goods:

1. intuitive self-respect or self-esteem: "Without it nothing may seem worth doing, or if some things have value for us, we lack the will to strive for them" (p. 400);
2. a rational long-term plan of life given reasonably favorable circumstances... [for] the good is the satisfaction of rational desire" (pp. 92-93);
3. the liberty and opportunity to develop and exercise the action competencies necessary to realize a rational life plan; and, finally,
4. the income and wealth that results from such competent work.

Again, we see the need to cultivate an awareness that embraces the realms of the intuitive whole, the rational strategy, plan, or rules, congruent action, and outcomes (in this case, income), *and that observes and corrects errors and incongruities in translations from one realm to another.*

An analogous, dynamic process of cultivating an embracing awareness of mission, strategy, operations, and the bottom line*, and of observing and correcting incongruities among them,* is necessary for continual quality improvement in business enterprises and other organizations.

As we will explore in Section III, Chapter 13, an analogous dynamic process of cultivating an awareness of paradigm, theory, research methods, and data—*and of observing and correcting incongruities among them*—is necessary for a liberative and responsible social science. In political life, the paradigm of just action is again analogous. That action is just which:

1. gradually explicates the underlying principles of justice;
2. elaborates laws and policies consistent with those principles, as well as internally consistent with one another;
3. duly administers this justice in a way that is both substantively and procedurally congruent;
4. gains increasing voluntary compliance by the citizenry; and
5. *observes and corrects incongruities among principles, laws, administration, and effects on the citizenry.*

Chapter 3: Developing toward Transforming Leadership

First Glimpses of Transforming Power

This is the key “trick” or “secret” of transformation—that it can be generated neither by internal motivation alone, nor by external pressure or opportunity alone. An exercise of unilateral power can force changes in external behavior, but cannot transform the meaning-making structure of a system. Developmental theory tells us that transformation to a qualitatively different and more inclusive way of making meaning requires playful, reciprocal initiatives between system and environments, child and parent, student and teacher, manager and mentor.

Hence, a person exercising *transforming power invites mutuality*—a mutual exercise of power guided by a living awareness of what is currently at stake for the particular systems participating in the transformation. The chick seeking to crack the egg shell from the inside may not succeed alone; but if the mother hen cracks the egg before the chick is ready, the chick will surely die. Only if both cooperate appropriately from inside and outside can transformation occur.

Transforming power cannot be insolently and unilaterally wielded. Instead, it *requires a continual, humble effort—not just to be rational—but to be aware of the present moment in all its fullness*. This awareness effort includes and transcends one's own material interests, emotional preferences, and intellectual theory about the situation, as well as those of the others and the institutions involved. This effort also transcends the narrowness of the present and experiences how the past is growing into this moment and the future is growing out of it.

In order to avoid such outcomes [as were discussed in a section not included in this excerpt], *transforming power* is not merely open to, but *actively seeks, challenge and contradiction*. Indeed, properly appreciated, each moment of potential transformation is such a challenge, since the person seeking to exercise transforming power is relating to systems that do not initially share an understanding of what is at stake.

The person seeking to exercise transforming power must seek challenges to his or her approach in every way possible—by taking on dilemmas of increasing complexity or social scope, or dilemmas that go more deeply to the heart of the culture as a whole, or by discovering new ways of conducting inquiry that better show the negative consequences of his or her perspective and action.[8] The active search for such challenge is essential precisely because the Strategist perspective is likely to be a powerful one that permits one to exercise significant influence—even transformation—in the wider world. The Strategist's perspective can therefore easily outshine and subordinate other perspectives. It can generate ego-inflation and an associated blindness and lack of living awareness that can make the very strength of the Strategist demonic. To confront and thwart this tendency, transforming power must be understood, to put it in the strongest form possible, as self-mortifying. It would rather *not* influence than inappropriately influence. This is how far transforming power goes to seek challenge and contradiction.

As the foregoing paragraphs also imply, *transforming power is nothing if not timely*. A distinguishing feature of a Strategist stage theory—and of developmental theory in particular—is that it explicitly draws the attention of the person holding the theory to the question of timing in action. However, any theory of development and transformation, such as this one, clearly has general, universalistic elements to it, and may be applied "in general" without specific attention to the uniqueness of the given situation. This, again, is a danger of the Strategist who tends to identify with the theory. In fact (or, more precisely, in *act*) transforming power is never properly applied in general, but always in response to the unique circumstances of particular situations and systems—always in response to a living awareness that revivifies and revalidates (or else disconfirms) the general categories of the theory.

Put differently, transforming power is not enacted in a deductively logical fashion. It does not deduce a specific action from general principles. Instead, *transforming power is enacted analogically*. It seeks analogies between a general theory and an independent apprehension of the present situation, felt from the inside as a participant in it.[9]

Finally, *transforming power empowers all who come within the radius of its influence, including those who oppose its influence*. The exercise of transforming power is intrinsically a cooperative 'positive-sum' game, not a competitive "zero-sum" game. It generates greater power—a greater range of awareness, control, and influence for each person or organization that transforms to a later stage of development. Also, because it seeks challenges, tests the feedback received for validity, and defers to validated negative feedback rather than defending against it, the exercise of transforming power empowers opponents as well. As stated above, transforming power invites mutuality; the more others are empowered and the closer they come to exercising transforming power themselves, the more nearly mutual occasions of influence become.

[Chapter 3's] Conclusion

There must be a "power of balance," I felt (though I gave it no name then), that was less coerced and coercive in the realm of diplomatic power. There must be, I felt, a power of balance that anyone, living an outwardly ordinary life in familial and organizational settings, could embody. This power of balance would have room for Pope John's unilateral coercion of Monseigneur Tardini, and for the logistical subtleties of the Motorola vice-president's "octave" meeting-strategies, and even for Gandhi's forms of diplomatic power on occasion, just as it would also have room for the transforming power that both Pope John and Gandhi most clearly exercised [referring to illustrations not included in excerpts]. But the power of balance would, precisely, *have* each subordinate type of power (including transforming power) rather than *being* (fully identified with) any one type of power. It would exercise each type of power occasionally and intentionally, not always and assumptively. And, the power of balance would always be exercised in the service of increasing mutuality, development, and inquiry, no matter which of the subordinate forms of power it displayed at a given time.[34]

Only a theory and practice of this type of power can ultimately generate a more just organization or society from a relatively unjust beginning state. Only this kind of power is self-limiting and self-legitimizing because its aim is to support the development and empowerment of others and because its practice is to challenge itself and publicly test whether it is in fact accomplishing this. Hence, only this type of power generates genuine authority—authority based not on unilateral power or custom and longevity, but rather on just action (defined in Chapter 2).

Chapter 5: Exercising the Power of Balance in Middle Management

Creating Liberating Structures

I and my associates have been experimenting with such "liberating structures" in business, governmental, and educational settings for the past twenty years and have adduced eight essential qualities of liberating structure. The following pages first explicate these eight qualities briefly and then illustrate them by references to a particular organization.

Before offering this rather complex definition of liberating structure, I want to offer some simpler heuristics that I use to create such structures and some brief illustrations to give the idea some life. The more complex set of eight essential characteristics derive from after-the-fact analysis of such structures. They are helpful for testing whether an invented social structure is a liberating structure; but I suspect that they are far too ponderous to help in conceiving a liberating structure.

The simplest heuristic for creating a liberating structure is to list all the limiting conditions (e.g. lack of money, employees without the right skills, etc.) that prevent one from accomplishing some desired goal; and then set about inventing a structure that recognizes and even uses these limits to reach the goal. In principle, this is no more than the old saw: "turn problems into opportunities." But this cliché is as rarely enacted as it is regularly espoused, especially in the domain of creating social structures for doing tasks. The reader may recall the description from the previous chapter of the initial meetings of the MBA core team at Boston College. The problem was that faculty groups typically argue themselves into terminal depression and withdrawal rather than agreeing to anything.

Rather than attempting any number of complicated and covert means to overcome this limiting condition, we simply recognized it and made a game of making fast decisions. Once several decisions were made, the limiting condition no longer existed, so the elaborate structure temporarily set in place to make fast decisions was no longer necessary either.

A second simple heuristic for creating a liberating structure, which the foregoing illustration also exemplifies, is to create a structure which, if it works, will become unnecessary. The most fundamental reason why liberating structures are necessary in the first place is that few human beings today operate at the late stages of development where they can follow the interweaving of the four territories of experience and can exercise mutuality-enhancing transforming power, such that they take full executive responsibility for the effects of their actions and treat one another as true peers. The most fundamental aim of liberating structures is, therefore, to cultivate the development of subordinates toward the later stages (never forgetting that development cannot be forced). Hence, if liberating structures succeed, organizational members will increasingly take executive responsibility, will increasingly treat one another as peers, and will increasingly create their own liberating structures.

A third simple heuristic for creating liberating structures is to ask oneself how to maximize both of two apparently opposite values, such as power and justice, or inquiry and productivity. Usually, we think we have to sacrifice one of these for the other, or else compromise between the two. Totally new solutions to such dilemmas begin to suggest themselves if we disdain our competitive assumptions and seek counterintuitive solutions. Thus, for example, the previous chapter illustrated how project groups in the BC MBA program are required to engage in unusual levels of mutual inquiry and evaluation; yet this inquiry unleashes rather than paralyzes productivity (because of the details of how it is organized).

The Eight Essential Qualities of Liberating Structure

One quality of liberating structure is deliberate irony. The leadership (at whatever level) recognizes that most subordinates will initially interpret the organizational structure and particular events based on a different model of reality (a different stage of development) from the one inspiring the leadership. Moreover, subordinates will not tend to interpret the resulting conflicts as caused by the different developmental frames, nor will they be inclined to examine or test their own frame. The leadership must at one and the same time succeed in “speaking the subordinates' (developmental) language” and introducing them to a “new language” (e.g., the theory and practice of mutuality-enhancing power).

The new “language” will motivate exploration of basic assumptions about reality by constructing tasks wherein members feel the limitations and self-contradictions inherent in their, relatively self-restricting view of reality. Organizational structures and leadership actions that meet these demands are deliberately ironic: they both acknowledge and bridge a gap in developmental stages and worldviews.

A second quality of liberating structure is the definition of tasks that are incomprehensible and undoable without reference to accompanying processes and purposes. Ordinarily employees or students treat tasks as meaningful in themselves or as meaningless except in terms of external rewards, masking the operation of their own interpretive scheme (at whatever their stage of development) as the source of meaning. By contrast, liberating tasks are epistemologically transparent: the product and the process congruently embody and reflect the purpose. Members cannot successfully complete liberating tasks unless they challenge their usual ways of doing these tasks without awareness of process and purpose. Consequently, and ironically, liberating tasks will initially seem opaque, strange, and disquieting to many organizational members since they are unaccustomed to such tasks, even though what is strange about them is that they are actually epistemologically transparent and that they encourage awareness of this fact.

A third quality of liberating structure is premeditated and precommunicated structural evolution over time. Such evolution reflects the movement by organizational members as they move toward conscious appropriation of the process and purpose territories of reality and thus toward the possibility of collaboration in the search for shared purpose, self-direction, and quality work. Such pre-communicated structural evolution also counters the tendency to treat a given structure as the ultimate substance of an organization and encourages the search for a continuing thread of meaning—for a shared purpose beyond structure. The premeditated and precommunicated phasing of this evolution helps to persuade members that some discoverable rhythms underlie even the most fundamental transformations.

A fourth quality of liberating structure is that its tasks are so structured and its leadership so functions as to provide a constant cycle of experiential and empirical research and feedback on participants' different ways of constructing reality, on their changing relations to one another, and on the quality of their work.

A fifth quality of liberating structure is the use of all available forms of power by the leadership to support the first four projects. Instead of attempting either to hoard power or to give it away, the leadership uses the logistical, diplomatic, and unilateral powers granted it by its institutional status and by its members, as well as the transforming power granted by its own experiential authority. It uses all these powers to perform a kind of psycho-social jiu-jitsu whereby the members experience both more discretion and more direction than usual. These conditions can lead the members gradually to question their own assumptions about the nature of power and begin to experiment with the creative power to constitute a new world. In so doing, the members increasingly join the leadership in a community of inquiry. The leadership does not use power manipulatively—that is, covertly and in order to maintain unilateral, exploitative structures. Instead, it uses power openly to create increasingly collaborative conditions.

A sixth quality of liberating structure is that the structure at any given time is open, in principle, to inspection and challenge by organization members. The organization requires the vigilance of all its members to determine whether its purposes are hazy and whether its specific structure, implementing behaviors, and products or services are congruent with its purposes. But members' charges of organizational incongruities may well be untrustworthy so long as the members themselves are unaccustomed to searching for incongruities among their own presuppositions, strategies, practices, and effects. Thus, especially initially, charges of organizational incongruity by subordinates may mask an unwillingness to face personal incongruities. The attentive leadership will turn such conflicts into educational opportunities. To state this idea another way, the openness of the leadership is made possible by, and is limited to the service of, a principle of inquiry more fundamental than any particular structure.

A seventh quality of liberating structure is that the leadership becomes vulnerable, in practice, to attack and public failure as soon as it behaves inauthentically when its tasks, processes, and purposes become incongruent and it refuses to acknowledge and correct such incongruities. By promising much, designing unconventional (and therefore often uncomfortable) tasks, and inviting full inspection, a liberating structure sets the stage for members' disillusionment. If the leadership exerts power in manipulative and defensive ways, members will become disillusioned with the leadership. If the leadership shows appropriate strength, vulnerability, and integrity from moment to moment, members will shed various illusions about themselves, about organizing work, and about the nature of reality, and will develop toward later stages.

A final quality of liberating structure, implicit throughout the foregoing discussion, is a leadership committed to, and practiced in, seeking, recognizing, and righting personal and organizational incongruities. The leadership leads other organizational members in learning while improving quality and in creating social settings that encourage simultaneous learning and quality work.

Chapter 13: The Vision of Action Inquiry

The Hierarchy of Political Principles in the Action Inquiry Paradigm

Because action inquiry is simultaneously a type of inquiry and a type of action—a type of science and a type of politics—it is appropriate to end this chapter with a consideration of its ordering of political principles. The action inquiry paradigm embraces and orders the three traditional political principles—Liberty, Equality, and Fraternity—and adds two more principles that have not heretofore been treated as political—Quality and Inquiry.

- *Inquiry*—the aim of creating existential communities of inquiry—is the primary political principle.
- *Peerdom* (Fraternity and Equality, without the sexist connotation of Fraternity) is the secondary political principle. True Peerdom is only approached as a peer culture or community of inquiry is created.
- *Liberty* is the tertiary political principle. Liberty is only approached in the context of a system, community, or culture that encourages peerlike inquiry and that grants equal rights—only in the context of Peerdom.
- And *Quality* is the quarternary political principle, approached only in the context of the commitment, attention, and skill cultivated through ongoing practice of the first three principles.

Presented so briefly and so abstractly, the interdependencies among these four political principles are hardly obvious. I attempted to state these principles and their interrelations for myself fifteen years ago. Although the language remains abstract and the tone of voice comes out more missionary, as a public utterance, than I am altogether comfortable with, I share it here:

The Politics of Inquiry

If I am to inquire into the meaning of human being as I act—if I am to act humanly and not automatically—I wish immediately to share this inquiry with all human beings. The meaning of human being is not some answer worked out by one for many. The meaning of human being is revealed in the response of each to each as we engage together in world transforming inquiry-in-action. There is no genuine community of inquiry that does not include the entire species because no one's imagination can encompass another's reality—can encompass the full meaning of *human being. As one wishing to inquire, I speak of my respect for you, of my esteem for you, yes, even of my love for you, when I address you as a stranger. As I address you in this way, and you reply, and our familiarity grows, you become stranger and stranger, until at moments I come to appreciate your Infinite Strangeness (my Infinite Strangeness), your individuality (my individuality), your craftiness (my craftiness).*

As our mutual value thus appreciates through fraternal inquiry, so does the value of our works. Indeed, as we come to appreciate the full mystery and majesty of human being, we begin for the first time wholeheartedly to seek to craft goods —products, services, and celebrations in—formed by the openness, discipline, and inspiration of living inquiry. All craft—whether verbal or manual—requires an inquiry- in- action repeatedly reawakening us to the matter and the moment at hand. As initial author of the words above and below, I can say, after thirteen years of increasingly independent questioning, that I experience their truth. I experience how these ideas found my questioning. I experience how they sculpt me. The call of these ideas so obviously animates, interpenetrates, and illuminates my daily life alone and with others (to the small degree that I can bear illumination) that I feel increasingly as though they are staking their life in me. (To say that I am willing to stake my life in them would be to treat them as contingent and myself as capable of choosing other foundations—which is not how I experience the situation.)

I believe these ideas are fundamental to a just and inclusive world community and I believe that all persons can come to experience their truth through inquiry. Thus, I do not urge anyone to believe what I say, but rather to join in the inquiry. Yet so few find their way even that far: to join in the inquiry. Indeed, this is the great mystery: how to generate a politics of inquiry. In the past, three great political principles have been propounded —liberty, equality, and fraternity. No state has ever attained all three. Indeed, none of the three has ever been attained alone, though some states have approached one and some another.

What some persons regard as the path toward just practice, other persons regard, equally assuredly, as the path toward hell. We are missing a fourth political principle—a principle never before recognized as political—the principle of inquiry. The only political principle that invites the potential transformation of everyone's perspective is the principle of inquiry.

Quality results can never occur so long as persons have no genuine felt sense of individual liberty—so long as persons do not experience their visceral power to craft. In the absence of the voluntarily-assumed, empowering discipline of craft, people are reduced to the status of consumers, requiring more of the same thing than another in order to imagine themselves better than the other, since they cannot really feel good about themselves. A positively empowering sense of individual liberty can only rarely occur, in turn, so long as groups, organizations, and nations do not create equality of opportunity, equality before the law, as well as genuinely friendly atmospheres where each seeks to meet the otherness of others. Only meetings under such conditions encourage and challenge persons to set their own goals, to risk for the sake of quality, and to grow in response-ability, rather than simply to conform externally to narrow norms of appropriate behavior.

But such a genuine peer culture—an inclusive atmosphere that actively encourages quality, liberty, and equality can, in its turn, never develop except in the service of the questions and dilemmas which face the human species as a whole. Any sense of fraternity rooted in specific answers must be implicitly, if not explicitly, elitist and imperialistic. (Which is not to say that a community of inquiry has no place whatsoever for answers: the strong declarative quality of the foregoing paragraphs may illustrate that foundational questions generate many answers in time, but answers that are rooted in and enliven inquiry rather than ending it.)

Not only is the development of a worldwide community of inquiry unlikely (all organization is, after all, improbable by definition), but the process by which it develops must be doubly unknown. If achievement of the community of inquiry comprising the species as a whole is the condition for full appreciation of the unknowns at the center of human being, then the fact of the unknown itself remains largely unknown during the process by which some promote evolution toward the community of all. Doubly unknown, this process of introducing the unknown can nonetheless certainly be characterized as ironic and as unlike any political process we have witnessed heretofore.

That I wish to share the inquiry into the meaning of human being with all human beings and that a liberating peer culture requires such shared inquiry—these facts do not, of course, imply that anyone else in the world, much less everyone else, wishes to join in such inquiry at the outset. Indeed, the very glory of our civilization—its development of production technologies and information systems that make global material welfare feasible—distracts our attention from the less tangible realms of liberty, peerdom, and inquiry, making the development of a community of inquiry all the more unlikely.

[Chapter 13's] Conclusion

Modern science is characteristic of a prolonged era of human history during which the principle dynamic has been the effort to elevate human communities from a reliance on custom to a reliance on reason. As custom ceases to glue people's interactions as reliably, their behavior oscillates between guidance by reason, by custom, and by market exchange or terror. Such is our world today.

On the brink of the twenty-first century, the United Nations struggles to find some principle and practice that can, without destroying local initiative, supercede national law in weaving a global community. It has yet to discover the primary potential source of its power. Not arms and unilateral force; not diplomacy; nor law will be its primary instruments of power, if it is indeed to contribute significantly to global development, global productivity, and global justice. Cross-cultural, cross-paradigmatic, transforming inquiry in the midst of ongoing practice must be the kind of power that the United Nations cultivates, if it is to play a truly constructive leadership role in the coming centuries. An Inter-Cultural Inquiry Corps could dispatch multi-professional, six-person teams throughout the world to relate to specific organizations and communities, to provide leadership training to individuals, and, on behalf of a not-for-profit investment consortium, to identify businesses that deserve micro-development capital investments. The degree to which nations contributed to and invited the presence of such an Inter-cultural Inquiry

Corps would provide an immediate measure of their openness as a polity to inquiry and self-transformation.

Such experiments in personal and social transformation will be fraught with risk and difficulty, as have been the ones described earlier in this book and in the next chapter. Everyone will be reaching beyond themselves at the same time, for few are now dedicated to questioning their own assumptions in the midst of action by widening their attention, while continuing to act. Few explicate the frames they are assuming, the advocacies they mean to make, the illustrations that influence them, and the inquiries that would test and validate or invalidate their current direction of action. Still fewer are prepared to create, implement, and recreate liberating structures. And fewer yet are prepared to joust creatively and non-violently with deeply ambivalent and at least semi-hostile superior cultures as they do so.

Chapter 1

1. Torbert, W. 1987. *Managing the Corporate Dream: Restructuring for Long-Term Success.* Homewood IL: Dow Jones-Irwin. [This book will hereinafter be referred to simply as MCD.]

2. Hobbes, T. 1960, reprinted from 1651. *Leviathan* Oxford, England: Blackwell. Simon, H. 1957. *Models of Man.* New York NY: Wiley.

3. This is not strictly true, for Hobbes bases the sovereign's claim to absolute power on the prior social contract by which he claims citizens can be supposed to have granted the sovereign such power as the only sure means to preserve peace and hence life. In the strict sense, then, Hobbes argues that right makes might, and so begins a process in Western political philosophy and political history whereby sovereign power is seen to emanate from below - from the citizen - rather than from above - from God.

4. Jacobs, S. 1990. As streets turn deadly, youth revise their survival code. *Boston Globe* 2/24:1.

5. For detail, see Rawls, J. 1972. *A Theory of Justice* (pp. 167-187). Cambridge MA: Harvard University Press.

6. Smith, A. 1969, reprinted from 1759, *The Theory of Moral Sentiments*, Indianapolis IN: Liberty Classics. “The man of real constancy and firmness who has been bred in the bustle and business of the world has never dared to forget for one moment the judgment which the impartial spectator would pass upon his sentiments and conduct. He has never dared to suffer the man within the breast to be absent one moment from his attention. With the eyes of this great inmate he has always been accustomed to regard whatever related to himself (p 246).” These powerful lines argue that particularly people bred in “bustle and business” are ethically self-regulating - an argument particularly difficult to accept uncritically in the post-Boesky, post-Bakker, post-North era. In another place, Smith offers a quite different sense of our relation to the impartial spectator. He acknowledges, for example, that practice under conditions of hardship is necessary

to awaken the man within the breast, and that no one willingly undergoes such hardship (255-256). At still another point, Smith acknowledges the almost superhuman difficulty of operating amidst passions and hardships while remaining awake to the impartial observer within the breast; to become impartial in reflection is a wholly different challenge from being impartial in the midst of action: “When the action is over... and the passions which prompted it have subsided, we can enter more coolly into the sentiments of the indifferent spectator... But our judgments now are often of little importance in comparison of what they were before, and can frequently produce nothing but vain regret and unavailing repentance, without always securing us from like errors in time to come. It is seldom, however, that they are quite candid even in this case... He is a bold surgeon, they say, whose hand does not tremble when he performs an operation on his own person; and he is often equally bold who does not hesitate to pull off the mysterious veil of self-delusion which covers from his view the deformities of his own conduct (262).”

Obviously, there is considerable tension between Smith's two views: the one of an impartial, omnitient spectator who, almost by birthright, dwells within our breast and whom we never dare to forget for one moment; the second of an impartial spectator to whom even the most capable of us may never awaken at the crucially decisive moments of our lives. As the foregoing quotations show, Smith gives ample attention to each of these dichotomous perspectives. Yet, surprisingly, he never directly acknowledges the tension he illustrates. Instead, the main line of his argument is based upon the powerful presence of “the man within the breast” as an ethical regulator of conduct. Recently, Amartya Sen has shown that the rationality construct within utilitarian theory is itself not unitary, that it in fact is open to multiple interpretations of what self-interest in fact is. This brilliant opening of economic theory from the inside indicates a path along which modern economic theory may be reconciled with the developmental theory presented in this book, which emphasizes the enormous significance of just these different interpretations of what is in one's self-interest. See Sen, A. 1982. Choice, Welfare and Measurementÿ Cambridge MA: MIT Press; Sen, A. 1987. On Ethics and Economics London, England: Basil Blackwell; Klamer, A. 1989. A conversation with Amartya Sen. Journal of Economic Perspectives 3, 1:135-150.

7. Smith was quite explicit, in passing, in The Theory of Moral Sentiments that the invisible hand can be interpreted as a form of deception. Our attraction to wealth and to utility as means to happiness, Smith tells us, is not really due so much to: “the superior ease or pleasure which (the rich) are supposed to enjoy, as of the numberless artificial and elegant contrivances for promoting this ease or pleasure (p. 302)... From a certain spirit of system... from a certain love of art and contrivance, we sometimes seem to value the means more than the end (p. 306)... If we consider the real satisfaction which all these things are capable of affording, by itself and separate from the arrangement which is fitted to promote it, it will always appear in the highest degree contemptible and trifling. But we rarely view it in this abstract and philosophical light. We naturally confound it in our imagination with the order, the regular and harmonious movement of the system, the machine or the economy by means of which it is produced. The pleasures of wealth and greatness, when considered in this complex view, strike the imagination as something grand, and beautiful, and noble, of which the attainment is well worth all the toil and anxiety which we are so apt to bestow upon it. And it is well that nature imposes upon us in this manner. It is this deception which arouses and keeps in continual motion the industry of mankind (p. 303).”

8. Simon, H. 1980. *Models of Man*. P.5.

9. Dahl, R. 1963. *Who Governs?* New Haven CT: Yale University Press. Galbraith, J. 1983. *The Anatomy of Power*. Boston MA: Houghton Mifflin. Pfeffer, J. 1981. *Power in Organizations.* Marshfield MA: Pitman.

10. Pfeffer, op.cit. p. 2.

11. Rousseau, J. *The Social Contract* Bk I, Ch 312. Barnard, C. 1938. T*he Functions of the Executive* Cambridge MA: Harvard University Press. p. 167. Barnard's reference to "authority" and the frequent reference to legitimate power as authority together raise the question why I am here calling this phenomenon "diplomatic power" rather than "authority." Chapters 2 and 3 will discuss the relationship between power and authority, so the full answer will come then, but, briefly, consent alone does not assure legitimacy and authoritativeness. To be truly authoritative, I will argue in Chapters 2 and 3, requires that power—whether diplomatic, unilateral, or otherwise—be exercised in a fashion that is rational, timely, and conducive to the development of those affected.

13. Rousseau, op.cit. Bk I, Ch 6.14. Kant, I., Grounding for the Metaphysics of Morals p. 23

15. ibid.

16. ibid. p. 22. At certain "teachable moments," Kant's educational advice is no doubt true. Influenced by him, I have sought moments to present duties to my children in this stern and confronting manner. But at other times I explicitly bribe my children to do something good (and once one of them refused the bribe!). For there are times when austere rationality makes no contact with our attention; a humorous exaggeration may awaken a corresponding gleam in the child's eye, wherein the parent may imagine lurking an appreciation of the rational. And it is not only children who fall away from the rational from time to time. Some readers have no doubt fallen to sleep at some point during their attempt to read the previous pages, rather than finding themselves elevated to a higher wakefulness. I myself could not even bring myself to read an entire book of Kant's until my forty-fourth year.

17. Bowers v Hardwick 106 S. Ct. 2841 (1986). Justice Blackmun's dissent in the 5-4 decision best articulates the right of privacy doctrine that had been evolving over the previous twenty years, since the contraception decision in Griswold v Connecticut 381 US 479 (1965). Patrick Devlin propounds the 'Will of All' perspective that what disgusts 'the man in the street' may be criminalized in The Enforcement of Morals. H.L.A. Hart responds from a 'General Will' perspective in Law, Liberty, and Morality. I am indebted to Morris Kaplan for organizing these arguments in his March 5, 1990 address at M.I.T. on "Lesbian and Gay Rights: Privacy, Equality, and Community."

18. Some familiar with Kant may object that his approach was "legislative" rather than "judicial" because he spoke of persons as ideally legislators in a Kingdom of Ends (indeed, since every citizen is, presumably, King in a Kingdom of Ends, one might argue that Kant's vision was "executive"). This confusion of the three branches is to be expected in a theory that sees all human action as subordinated to reason, but since he himself recognizes his discussion of the Kingdom of Ends as idealistic, and since relations among the justices of the U.S. Supreme Court

may come as close to instantiating this ideal as those of any other historical governing body, it seems to me fair to summarize his thought as judicial and aristocratic in nature.

19. Rawls, op.cit. See also my fuller treatment of these issues in Torbert, W. 1974. Doing Rawls justice. Harvard Educational Review 44, 4: 459-469.
20. ibid. 465-466.21. ibid. 472-473.22. ibid. 302.23. ibid.24. Kohlberg, L. & Turiel, E. (Ed.s). 1973. *Recent Research in Moral Development* New York NY: Holt, Rinehart & Winston.

Chapter 2

1. Pitkin, H. 1972, *Wittgenstein and Justice*, Berkeley: University of California Press. As Pitkin has so carefully argued, the very structure of *The Republic* wherein Plato assumes a fixed class structure and a need for a 'noble lie' (rather than a direct explanation) to 'keep people in their proper place,' in effect provides a very tough test of whether one can generate justice in unpropitious conditions—conditions in which few are, by the nature of their relatively fixed worldview, prone to seeking out and enacting justice (the dialogue does not assume an altogether fixed class structure; indeed, parents and leaders are specifically prompted to be on the lookout for youths who ought to be in a different class from that into which they are born).

Chapter 3

8. For example, Chris Argyris has, over the past quarter century, devised a variety of techniques for publicly testing the validity of social observations and inferences among the very participants in a social situation where there are different and conflicting perspectives. His most recent publication on this topic is Argyris, C., Putnam, R., & Smith, D., 1985, *Action Science: Concepts, Methods, and Skills for Research and Intervention*, San Francisco: Jossey-Bass

9. See my discussion of analogical thinking in Chapter 9 of *Managing the Corporate Dream* and in my description of Pope John XXIII in “Leading Organizational Transformation” (full cite, footnote 10). See also Alan Watts, *Nature, Man and Woman* (New York: Pantheon, 1958) on feeling inside.

34. Nielsen, R. 1990. “Dialogic leadership as ethics action (praxis) method,” *Journal of Business Ethics*, 9: 25-43. In this article, Nielsen offers an unusually rich synthesis of theory and actual leadership cases that demonstrate these characteristics of transforming power, and the other characteristics mentioned earlier in the chapter.

Lessons from a Pluralist Approach to a Wicked Policy Issue

Jake Chapman[1]

Abstract: The most difficult policy issues are those where there are profound disagreements about what is wrong, what should be done, and how things work. This paper describes a pluralist approach, based on the soft systems methodology, to youth nuisance on deprived estates in Manchester, UK, where there were profound disagreements between the agencies involved. When there are disagreements about the nature of the problem, its causes, or about how the system of interest actually functioned, a pluralist approach is required, and this is provided by Checkland's *soft systems* approach. When the disagreements involve conflicts of value, it is necessary to adopt an adaptive approach that fosters change in the values, beliefs or behaviour of those involved. In the spectrum of public sector agencies involved, five different perspectives of agencies were identified, their descriptions indicating the need for the pluralist approach taken. The project was an experiment in using systemic approaches in public policy and the paper describes the learning associated with impacting outcomes. Processes used in the project included a "soft systems" workshop, which is described along with some effects on both the project participants and overall outcomes. The overall aim is to share the experience of this project so that it may inform those working with systemic approaches and other pluralist methods on wicked problems in the public sector.

Keywords: Pluralist policy making, soft systems methodology, systems thinking, wicked problems, youth nuisance.

Introduction

In this paper I describe the application of a soft systems approach to a contentious policy issue that involves a spectrum of public sector bodies in the UK. The project was conceived by the sponsors (see below) as an experiment in using systemic approaches in public policy and the paper describes the learning associated with impacting outcomes.

There have been many attempts to make use of the ideas involved in *systems thinking* to make progress in areas of public policy, with varying degrees of success. Many of the methods and their application have been reviewed comprehensively by Jackson (2003), though this does not cover the more recent work by Seddon (2008, 2010). In a review of the relevance of systems

thinking to policy and government Mulgan (2001) identified seven factors that required a systemic approach:

- The ubiquity of information flows, especially within government itself
- Pressure on social policy to be more holistic
- The growing importance of the environment, especially climate change
- Connectedness of systems brings new vulnerabilities
- Globalisation and the ways in which this integrates previously discrete systems
- Need for ability to cope with ambiguity and non-linearity
- Planning and rational strategy often lead to unintended consequences.

These characteristics all play into the holistic nature of systems thinking and systemic approaches. However, many of the early attempts to use systems approaches failed because there was no agreement about the nature of the problem, its causes, nor about how the system of interest actually functioned. Where such disagreements exist a pluralist approach is required, and this is provided by the *soft systems* approach introduced by Checkland (1981). Checkland’s approach has been extensively used within organisations in both the public and private sectors in the UK (Checkland 1999; Morcos, 2009; Wilson, 2001) where the scope of disagreements is limited.

Most public policy issues involve disagreements about how to proceed and such disagreements are the “bread and butter” of politics. In most situations, policy makers and politicians establish policy according to their own preferences and positions in relation to the disagreements; that is, they adopt or champion one of the contested positions. However, depending upon the nature of the disagreements, this may not be the most productive way to proceed.

When the disagreements involve conflicts of value, either between groups or between the values people stand for and the reality they face, then, in Heifetz’s terminology (Heifetz, 1994, 2002, 2009), it is necessary to adopt an “adaptive” approach that fosters change in the values, beliefs or behaviour of those involved. A key feature of the strategy he proposes is that the leader does not seek to resolve the value conflict but instead gives the work back to the people—those who have to adapt. No amount of legislation, no law or policy, will cause individuals to change their values. Those changes have to arise as a result of the individuals facing reality, becoming aware of conflicting perspectives, and choosing to change. Heifetz and collaborators describe in some detail the difficulties in implementing such an approach and strategies that can be adopted.

In this article, I describe an approach that is suited to another context, namely one where the disagreements are not between groups of citizens or politicians, but between *agencies* responsible for the implementation of *any* policy initiative in a specific domain. The disagreements may involve conflicts of value, but more normally they are based upon different perspectives (or paradigms or frames) that cause those involved to interpret the situation differently and hence advocate different policies or strategies. These disagreements are characteristic of “wicked issues” and, it is argued, require a systems approach that encompasses the existing pluralism, as opposed to systems approaches that presume agreement on objectives or desired outcomes. Failure to embrace the pluralism will ensure that most energy is directed to the contests between agencies and not toward implementing any policy or action plan.

The issues and the proposed approach are illustrated by its application to the issue of Youth Nuisance in Manchester in the United Kingdom. The work described here formed part of a Demos project funded by the Neighbourhood Renewal Unit (NRU) and Manchester City Council (MCC) in 2005-2006. The Neighbourhood Renewal Unit was established in 2001 to coordinate government initiatives to tackle the most deprived neighbourhoods, some of which are located in Manchester. The next section describes the context of the project that includes the different perspectives held by agencies working in Manchester. This is followed by a description of the "soft systems" workshop run in Manchester in December 2005 and the immediate outcomes. The final section reflects on the impact of the workshop and project and draws lessons for interventions of this type in the future. The overall aim is to share the experience of this project so that it may inform those working with systemic approaches and other pluralist methods on wicked problems in the public sector.

Youth Nuisance in Manchester

Youth nuisance is part of the wider problem of anti-social behaviour (ASB) that became an important political issue during the 1990s in the UK. Typical examples of youth nuisance include graffiti, groups of youths harassing elderly pedestrians or playing music very loudly in public places. The youths involved ranged in age from 10 to 15, most of who should have been in school during the day. In order to "be tough on crime and on the causes of crime," in 1999 the government introduced Anti-Social Behaviour Orders (ASBO). An ASBO is a community-based order that can be applied for by the police or local authorities in consultation with each other against an individual, or several individuals, whose behaviour is anti-social. The behaviour must cause alarm, distress, or harassment to one or more people not in the same household as the offender. Applications are made to the Magistrates Court acting in a civil capacity. An ASBO might ban an individual from an area, such as a park or shopping centre, or require the recipient to cease certain behaviours. However, controversially, breach of an ASBO without reasonable excuse is a criminal offence with a maximum penalty of five years in prison. Where ASBOs have been issued for nuisance, but not criminal, offences, the effect has been to criminalise those subject to the orders. By 2005, Manchester was known as the "ASBO Capital" of the UK due to its extensive use of the orders; however the problem of youth nuisance was not improving significantly. The incidence of youth nuisance was higher in deprived neighbourhoods and it was Manchester's inability to meet its nuisance targets in these areas that prompted the NRU to initiate the project.

One of the disagreements brought into focus by Manchester's use of ASBOs as whether or not they were an effective deterrent for youths. There were reports in the press of youths being proud of having "scored" six ASBOs, with the implication that it added to their "street cred." This exacerbated the disagreements between those who wanted to eliminate youth nuisance by being tough and those who regarded the root of the problem as lying elsewhere. The various positions adopted by different agencies can be summarised as follows:

Enforcers:
This is the group that wants to adopt a zero tolerance approach to ASB in general and youth nuisance in particular. They want to establish very clear boundaries of what is acceptable and to enforce those boundaries with the force of law as necessary. Youths who, in their view terrorise old women, should not be exempt from the use of criminal sanctions. They regard those who object to ASBOs and criminal sentences as part of the problem – it is their liberal attitudes and failure to impose boundaries on children that has lead to the current problem.

Distracters:
According to this group, youth have always been mischievous, and probably always will be. The root of the problem is that now they do not have safe ways to let off steam. This group argues that what are needed are supervised activities and channels where the youngsters can channel their energy creatively. They see a large part of the problem stemming from general lack of youth facilities and the early closure of those that do exist. They also regard demonising and criminalising children as the worst possible response to the problem.

Parenters:
This group maintains that it is wrong to blame or punish the children who cause trouble because the people who are really at fault are the parents. They see the problems stemming from poor parenting, in particular a failure to impose and enforce normal boundaries of acceptable behaviour. For this group, the way forward is to hold parents more accountable for the behaviour of their children. They support the use of tenancy agreements and Acceptable Behaviour Contracts (ABCs) which, if breached, mean that the entire family is evicted. For this group, focussing on the children is letting the real villains get away.

Deprivation:
This group points out that the problem of youth nuisance occurs on deprived estates. Middle class suburbs are largely free of the problem, and this is regarded as highly significant. This group maintains that the real problem is families living in poverty, often dire poverty. This means that there is often insufficient space in the home for the children to play or study, there are not the usual resources of books and games available, and so it is not surprising that the children are out on the street causing mischief. All this is aggravated by the poor condition of the deprived estate, the poor quality school, the widespread use of drugs and incidence of criminality in the impoverished community. This group regards punishing the children of these impoverished families as inappropriate and as being advocated by people who do not want to see or address the underlying cause of extreme poverty. The solution they propose is to take measures to address the poverty.

Cultural breakdown:
This group regards youth nuisance and the whole spectrum of anti-social behaviour as symptomatic of the loss of value and respect in modern culture, a trend they see reinforced by the media, TV, computer games, rap songs and celebrities behaving badly. They point out that many of the youth involved in nuisances do not have a father at home; indeed the only male role models they see are drug dealers. They do not see how we can expect young

> children to behave appropriately when their parents fight and divorce, when common courtesies are regarded as antiquated, and crime and violence is glorified. For this group youth nuisance is a symptom of cultural breakdown and as such is a distraction from the core issue, which is finding ways to reinstate traditional values of respect.

These short descriptions do not do justice to either the strength of feelings involved, or the more subtle aspects of the perspectives involved. However, they are sufficient to demonstrate that each perspective is well articulated and clearly has some supporting evidence. Further, it is fairly easy to see how from each perspective those adopting one of the other perspectives are contributing to the problem. It is not just that these other people disagree about what should be done: what they are doing and saying is making matters worse. It is this antagonism between the perspectives that explains why so much energy is directed toward winning policy arguments—and stopping opponents—rather than addressing some aspect of the problem. Under these conditions, *all policy initiatives based in a single perspective will fail.* They will fail for a number of reasons because a policy based on one perspective will:

- excite intense opposition from all those holding different perspectives
- not address the complexity of the situation
- presume a homogeneity in the situation that does not exist.

Wicked Problems

Earlier it was asserted that this type of disagreement was a characteristic of a "wicked problem." This terminology was first introduced by Rittel and Webber (1973/1984). The abstract to their paper, originally written in 1973, remains cogent:

> The search for scientific bases for confronting problems of social policy is bound to fail, because of the nature of these problems. They are "wicked" problems, whereas science has developed to deal with 'tame' problems. Policy problems cannot be definitively described. Moreover, in pluralistic society there is nothing like the undisputable public good; there is no objective definition of equity; policies that respond to social problems cannot be meaningfully correct or false; and it makes no sense to talk about optimal solutions to social problems unless severe qualifications are imposed first. Even worse, there are no "solutions" in the sense of definitive and objective answers. (Rittel & Webber, 1984, p. 135)

A recent review (Chapman, Edwards, & Hampson, 2009) of the features of wicked problems and how these impact policy, identified the following five key characteristics:

1. The issue had defied previous attempts to "solve" it, i.e., there was a history of repeated policy failure. This is indicative that the normal reductionist and positivist approaches may not be appropriate.
2. There is profound disagreement on both the causes of the problem and the best ways to address it. As the above summaries indicate there are several different perspectives claiming priority in the case of youth nuisance.

3. The issue is unbounded in scope. This arises because it is connected with other issues that are also “wicked.” In the case of youth nuisance, there are obvious links to poverty, family breakdown and the persistence of deprived neighbourhoods all of which are also “wicked” issues.
4. The issue is resistant to completion, i.e., there is no sense in which one can ever claim that the “problem is solved.”
5. There is a high level of complexity involved, which means that aspects of the behaviour of the system of interest are *in principle* unpredictable.

These characteristics challenge the conventional approach to policy making which usually starts with a stage labelled “problem definition” (Strategy Unit, 2004). However, this is precisely the area in which the disagreements exist. Is youth nuisance a problem of poor parenting? Poor facilities? Poverty? Misbehaviour or cultural breakdown? Without an agreed definition of the problem, the conventional policy process cannot even begin. The alternative, proposed by Chapman (2002) is to adopt a systemic approach that is both holistic and pluralist, in particular, a *soft systems* approach.

As well as addressing the issue of youth nuisance, the Manchester project also had the aim of demonstrating the utility of systemic methods in addressing complex issues in deprived areas. The project involved three distinct phases. The first involved a series of interviews with a large number of individuals working in different agencies so as to appreciate the scope of the problem, initiatives that had been tried, and the different perspectives operating. The second phase involved a soft systems workshop, described in detail in the next section. The final phase involved constructing a system dynamics model of an aspect of the issue. This was undertaken by Lane (2007) and is discussed further below.

The Soft Systems Workshop

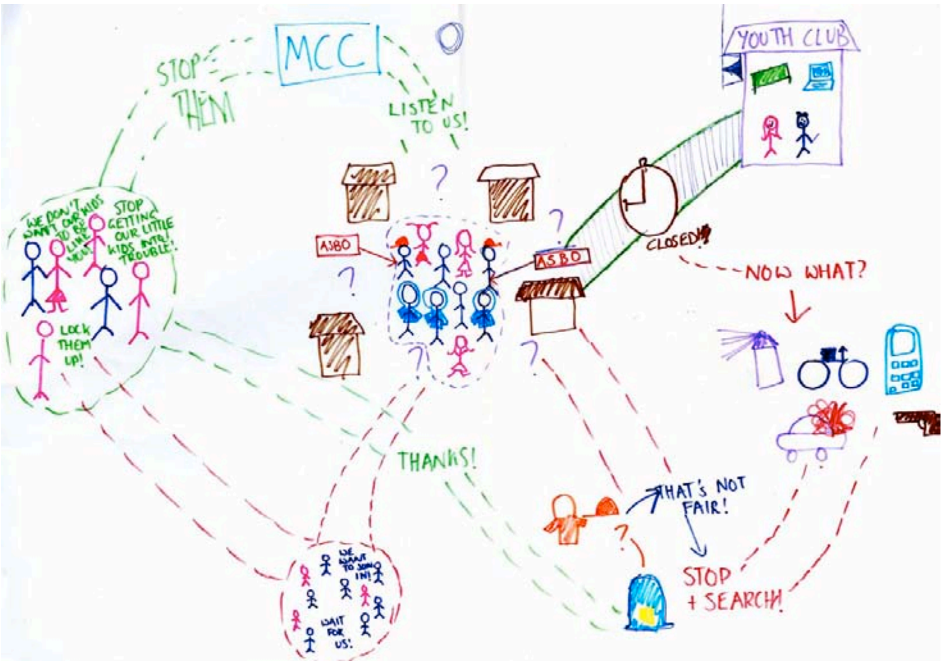
One of the roots of systems thinking lies in cybernetics and its application to engineering systems. In this domain, the development of computerised system dynamics models proved a powerful tool for analysis of industrial processes. Stafford Beer (2002) extended the domain to include broader organisational processes. Known as “hard systems,” these methods continue to find wide application today as demonstrated by the system dynamics literature and the use of “lean systems” (see, for example, Seddon, 2008) to improve the efficiency of operations in both the public and private sectors. In the 1970s it was anticipated that these approaches, coupled with the deployment of multidisciplinary teams, could be used to address a broad spectrum of social problems. These hopes were not realised in those domains where there were profound disagreements about *how the system functioned*. These disagreements, as described in the youth nuisance case earlier, mean that a model constructed using one perspective will be contested from the other perspectives, and will simply become another domain of disagreement and contest.

The “soft systems” approach was pioneered by Checkland (1981), who emphasises that what distinguishes his approach from “hard systems” is the way that systemicity is attributed. In hard systems, the observer or analyst perceives *systems* in the external world, systems that can be modelled and improved. In soft systems, the observer or analyst perceives *complexity* in the external world and organises the exploration as a learning system: thus, it is *the process of enquiry that is systemic* (Checkland, 1999). However, for the purpose of this project the main attraction of adopting Checkland's soft systems methodology (SSM) was that it explicitly surfaces the differences in perspective and uses a learning approach to devise *improvements* agreed by all the participants.

The Manchester project made use of a whole day soft systems workshop with about ten participants. The aim was to have representatives from all the different agencies and departments that were involved in addressing the youth nuisance issue in Manchester, including relevant central government departments. There were representatives from the NRU, The Home Office, The Government Office NW, Greater Manchester Police, several departments within Manchester City Council, a local resident, a youth project leader and the manager of a facility for dysfunctional families (the "Foundations project" described later).

The briefing for the workshop made it clear to the participants that they were to present their perspective on the issue as fully as possible, not with a view to changing other people's minds, but so that their perspective was understood by the other participants. Everyone was also asked to be open to hearing the perspectives of the other participants and to be willing to engage with a process that might strike them as strange, but which, in the end, would make sense. The group participants were seated at tables arranged in a large square with everyone looking toward the middle so everyone could see all the other participants. At each person's place, there was a stack of A3 paper and a large number of coloured pens available to share. The workshop was briefly introduced and then the participants invited to spend 10-15 minutes drawing a *rich picture* of how they perceived youth nuisance in Manchester. They were shown examples of pictures from other soft systems workshops to make it clear that drawing skills were not required but it was a real picture, not a diagram or flow chart, that was expected. An example of one of the rich pictures completed at the workshop is shown in Figure 1 below.

Once everyone had completed their rich picture, participants took a turn to introduce themselves to the group and to then show and explain their picture. After showing and explaining their picture, other members of the group could ask questions for clarification and there would sometimes be a short discussion of some of the issues raised. As the workshop facilitator, my role was to make notes on a flip chart of the key issues and themes that emerged from each picture, and to limit these initial discussions so that the main discussion could take place after all the pictures had been seen. The pictures were a powerful adjunct to each person's exposition of his or her perspective on the issue, because the visual element would often convey emotion, emphasis, and qualities that would be missed from a simple description.



MCC
STOP THEM
LISTEN TO US!
YOUTH CLUB
WE DON'T WANT OUR KIDS TO BE LIKE YOU!
STOP GETTING OUR LITTLE KIDS INTO TROUBLE!
LOCK THEM UP!
ASBO
ASBO
CLOSED!
NOW WHAT?
THANKS!
THAT'S NOT FAIR!
STOP + SEARCH!
WE WANT TO JOIN IN!
WAIT FOR US!

Figure 1. A participant's *rich picture* of youth nuisance in Manchester

This can be illustrated by particular picture, drawn by a woman who was a senior manager of the MCC anti-social behaviour programme. She concealed her picture after drawing it. When it was her turn to present she said who she was and her role and then held up her picture. She had filled the A3 sheet with a large heart, coloured in a deep red colour. Across the heart was a jagged black crack. She said, "Youth nuisance is all about broken hearts." The impact of her picture and words were tangible: it brought tears to my and other people's eyes.

Once all the pictures had been presented, about an hour and a half into the workshop, the group returned to topics participants wanted to discuss further. The first was whether ASBOs were effective in addressing youth nuisance, or, as some maintained, they simply added to the reputation of the youths involved. After a few heated exchanges, the youth project worker, who ran projects with some of the youths on one of the deprived estates, intervened and drew a key distinction between gang leaders and followers. He asserted that for gang leaders ASBOs were ineffective and did indeed often enhance the leader's reputation. However, for the "followers," the threat of an ASBO was often sufficient to bring the youth under control. This was a significant intervention because it allowed both sides to have their position affirmed without making the other side wrong. It prompted further discussion about the gang leaders. What emerged from this debate was that the gang leaders were usually male and usually came from single parent families where the mother was in difficulties, usually with addiction or mental illness and often both. It was not unusual for the youth to have an older brother who was already in custody and for there to be several younger siblings also out of control.

At this point, the manager of the Foundations project said more about the work of his unit. He ran a facility that took in families of the "gang leader" type and provided a combination of very clear boundaries and complete support. The facility could accommodate only five families at any one time but had a very high success rate in enabling the single parent to overcome her addiction and regain control of her family. Typically, a family would be in the facility for between 18 and 24 months and would continue to receive support through an outreach programme after returning to the wider community. The manager said there were several key features that enabled the unit to succeed:

- It was outside the MCC system (it was partly funded by a national children's charity) and so could combine services and facilities far more easily than anyone within the council.
- It had very clear rules, and a family breaking the rules risked eviction. The key rules were to cease "using" (drugs or alcohol), to keep the home clean, and to have the children in school on time every day. These were policed and enforced by 24-hour supervision.
- It was able to offer whatever support the families needed, including treatment for addiction, assertiveness training, parenting and cookery classes and assistance dealing with MCC procedures.

He recounted examples of the work of the unit. One woman was at the point of being evicted for repeatedly being late, both for appointments and in getting her children to school, when one of the workers realised that she could not tell the time. Another woman often returned late from trips to town and sometimes had to be collected from remote places. It transpired that she did not understand the numbering of bus routes and thought that all buses would carry her to and from the city centre. At one of the early cookery classes, when asked what they wanted to learn to cook, one woman responded, "I would really like to know how to make a sandwich."

These stories made clear the level of difficulty that the single parents experienced and that "broken hearts" were indeed a large part of the problem. Equally important, they contributed to an increased level of openness among the workshop participants. The problem was made more real by the stories and experiences of those working in the deprived neighbourhoods and with the most dysfunctional families and the workshop participants were able to let go of polarised positions and become more open to seeking ways of working together. It was important that prior to this, everyone had had the opportunity to present their perspective on the issue and to have had their concerns recognised and noted: this gave them the space to explore other perspectives and engage in a different type of debate.

SSM Modelling

The discussions continued for more than an hour and were brought to a conclusion by the facilitator asking the group to review the lists of topics that had emerged from both the pictures and the debate. The lists now covered half a dozen flip charts, but it was clear to the participants that there were a few obvious groups of items. These groups were identified and over the next 15 minutes condensed to four themes:

- Home and family life: role in providing boundaries, praise and respect
- Dealing with boredom and providing appropriate facilities
- MCC and other services needing to work together
- Involving the local community in addressing the issue and shifting perceptions of young people

The next stage of the soft systems methodology required the group to choose one of the themes and to then construct an *ideal system* that, if it existed, would address the issue encapsulated in the theme. It is important that the ideal system is not constrained by factors or issues in the real world; this is an abstract exercise with the aim of identifying a genuine *ideal*. The ideal system is then modelled in terms of the activities that would have to take place for the system to function effectively. It is common for the process to iterate between the definition of the ideal system and the modelling of the activities. Finally, the activities in the ideal system are *compared* to what is occurring in the real world with a view to developing an *agenda for improvement*. Undertaking these steps is actually straightforward since each logically follows from the previous step.

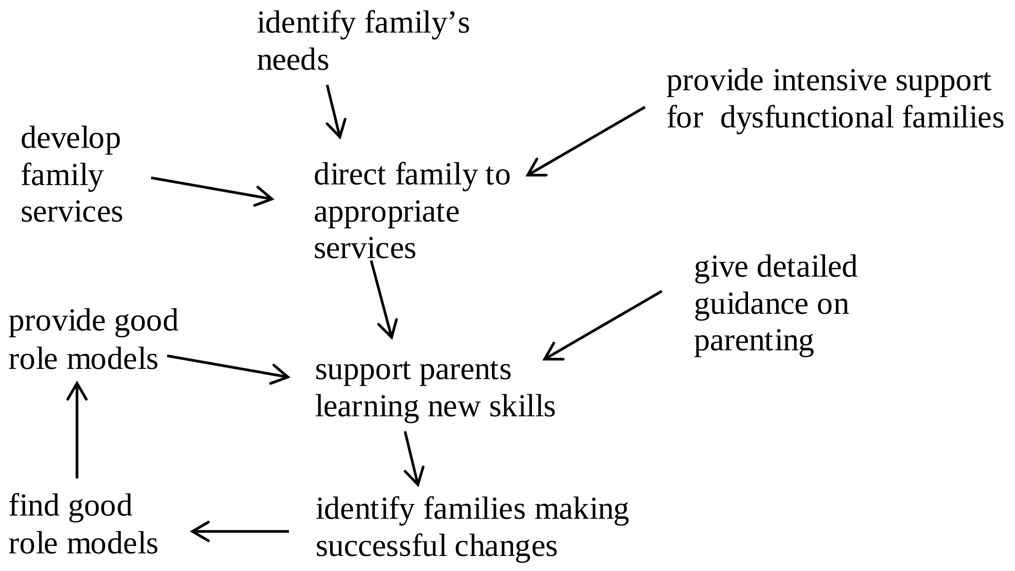
In the workshop, the sub-groups were formed to work on different themes. What follows is a summary of the work carried out on the 'Home and family life' theme. The definition of an ideal system has three components. The first is to identify *what* the system does, i.e., the transformation that it brings about. The second is to specify *how* the system achieves the transformation, i.e., the means employed. The third component is the specification of *why* this is being done, i.e., setting the larger context within which the system operates. Here is a definition of the "Home and family life" system used by the sub-group:

A system to improve a family's capacity to raise children	*(The purpose)*
by improving the parent's self esteem, providing role models and support and engaging children with education	*(The means)*
in order to enable young people to become fully functioning members of society	*(The context)*

In iterating this definition the group dropped the specific reference to parent's self esteem and subsumed this within the range of support services to be provided. It also dropped the reference to "engaging children with education" since this was regarded as separate from core purpose of improving a family's capacity. The activities that the group identified this system would need were listed as follows:

- Identify families needs
- Develop services to meet needs
- Direct families to appropriate services
- Provide intensive care for dysfunctional families
- Give detailed guidance on parenting
- Support parents learning new skills
- Provide role models for parents and children

This list was developed into the *conceptual model* illustrated in Figure 2. The model organises the activities into a logical sequence and helps identify any gaps or overlaps in the activities. One of the insights that arose for the sub-group working on this system was that the best role models were likely to emerge from the support system itself, as shown in this version of the model.



identify family's needs
provide intensive support for dysfunctional families
develop family services
direct family to appropriate services
give detailed guidance on parenting
provide good role models
support parents learning new skills
find good role models
identify families making successful changes

Figure 2. A conceptual model of the *ideal* family support system

The final stage in the SSM is to compare this model of an ideal system with what occurs in the real world in order to identify the steps that would lead to an improvement. It is stressed during the workshop that the aim is not to find a *solution* to the issue, but simply find the steps that can be agreed that would *improve* the situation. Once the improvement has been made then, ideally, the process would be repeated to establish the next improvement steps.

The group working with the ideal system shown in Figure 2 concluded that there were two improvements that they could all agree to. The first was to increase the capacity for handling dysfunctional families (the Foundations project). The second was to introduce parenting courses for parents of children over eight years of age. Up to that point, the parenting courses in Manchester had focussed on very young children whereas the youth nuisance issue only arose for children over eight! These are very practical steps, but the most significant feature of the conclusions was that all those involved agreed that they would support them. This is in sharp contrast to the competing perspectives and hostility present at the beginning of the workshop.

Workshop Outcomes

The aim of this section is to reflect on the shifts that occurred for the participants as a result of the Soft Systems workshop for the project. The previous section has described the workshop in some detail to illuminate these shifts because they are a crucial component of any pluralist approach to contentious policy areas.

During the pre-workshop interviews it became clear that most of those engaged with youth nuisance in Manchester were most interested in convincing the listener of the validity of their position and ridiculing other positions. This was reflected in the early exchanges in the workshop itself, particularly where the discussion entered disputed territory, for example whether or not ASBOs were an effective deterrent. It was highly significant for the workshop that this issue was resolved without making either side in the dispute wrong. Sometimes ASBOs were effective, and sometimes they were not—and the key difference was in the role of the youth in the gang. This reinforced the workshop ethos of sharing your own perspective as fully as possible and being open to hearing other peoples' perspectives.

The rich picture process also fostered a level of openness through:

- everyone sharing a strange process to which they were all new
- discovering who the other participants were through their pictures
- having the same amount time to present each person's picture and their perspective
- clearly conveying emotions as well as ideas via the pictures

The stories communicated to the group served two important roles. First, they were a powerful way to share people's firsthand experience of the issue. Second, many stories conveyed the severe levels of deprivation and the tragedies in the lives of those involved—and as such, opened people's hearts to aspects of the problem that their entrenched position had enabled them to ignore.

It was also important that the group was small, ten participants and two facilitators, since this enabled people to appreciate each other as human beings and not simply as representatives of "them." By the end of the workshop, there was a clear sense that the group had been on a journey that had affected all those involved.

A key element of that journey was a shift in the individual's ability to appreciate different perspectives. Achieving this shift was a significant outcome for the project (and see further below for the wider impact on outcomes) since it demonstrates the feasibility of working pluralistically using a systemic approach. It is highly likely that the shift experienced by the participants was temporary and limited to this domain; however, such experiences are the stuff from which development as an adult is constructed. It is also the case that the group participants were able to agree a number of improvements to the situation in Manchester without being seen to "win" the debate—an outcome that seemed impossible at the outset.

System Dynamics Component

As indicated earlier, it is only feasible to construct a system dynamics model when there is broad agreement about the way that the system of interest actually works, that is, what causes what. Whilst it remained impossible to model the issue of youth nuisance as a whole, following the SSM workshop there was agreement about the role of dysfunctional families and gang leaders in contributing to youth nuisance, and the treatment of this part of the problem could therefore be modelled. Although the construction of a computerised model requires the expertise of a modeller, the main contributors have to be those with knowledge and experience of working in the system. Furthermore, it is normal for the main benefits to arise as a result of the *modelling process* and not from the completed model. The benefits are realised because in the modelling process the participants have to surface their mental models of how things work and test them against the data available and the models held by others.

One of the conclusions from the SSM workshop was that dysfunctional families tended to propagate through generations. Many of the young single mothers in difficulties were themselves children of young single parent mothers with addiction or mental health problems. This process was likely to continue to produce children who would contribute to youth nuisance and eventually end in the criminal justice system. The aim of the modelling work was to explore the resources required to overcome this self-perpetuating system, and the likely impact this would have on youth nuisance.

The people involved in this modelling were deeply impressed by the process of surfacing and quantifying mental models and were able to develop a model that illustrated the scope and likely impact of targeting different interventions to families in different levels of need. Some of the data required by the process, for example the success rates of different interventions with different categories of families, were readily available. Other data, for example the number of potentially dysfunctional families with young children that was not directly measured, could be estimated. One of the strong conclusions was that without addressing the needs of the families involved, other measures such as ASBOs and tenancy contracts, could only have a limited effect on the incidence of youth nuisance. However, addressing the needs of the families would not lead to immediate large scale effects since there already existed a full pipeline of "problem families" whose children were approaching the age when they were likely to engage in anti-social behaviour. The model convinced those working on it that it would take a minimum of 20 years, and more likely twice that long, to deal satisfactorily with the core issues. The group also recognised that this was way beyond the planning or policy horizons of any of the agencies involved!

Conclusions

The soft systems workshop succeeded in identifying steps that could be taken to improve, not solve, the issue of youth nuisance in Manchester, despite the conflicting paradigms of those attending. The system dynamics model succeeded in showing those building the model the value of surfacing and quantifying their understanding of how the system worked—and also showed them the timescale for a significant improvement. However, the workshop, model, and the project as a whole had little impact on the policies and activities within Manchester. The aim of this concluding section is to explain why this was the case and to provide guidance for the future use of systemic methods in the domain of public policy. There are four main issues that have emerged from reflecting on this project.

The first is the amount of time required from the departments and agencies involved in the various strands of systems studies. Although those commissioning the work were informed that significant contributions of staff time were required, there was insufficient time available from the key individuals involved. (Ideally they were required to be available for several interviews, as participants in the SSM workshop, as advocates of the outcomes in their department and as contributors to the series of system dynamics modelling workshops.) There are several reasons for this. One is a failure of communication between the project commissioners and those required to participate. Another is the general level of overload of all public sector workers and the difficulty they have in prioritising what they see as an external project. Another was the alarmingly high number of projects being run by MCC. Indeed there were so many projects running concurrently that it would be impossible to identify which were having positive impacts. However, probably the main reason, and of particular relevance to the systemic approaches used here, is that the bulk of the work is done, and has to be done, by those already working in the system, not by the external consultants. As consultants, our role was that of expert facilitators whereas the real work, that of thinking through how systems function and so on, had to be done by the staff. What is more, much of what we were setting out to achieve challenged the way that these people worked and thought about the issues involved.

The second issue is the level of staff that worked with us on the systemic approaches. As the description of the SSM workshop indicated, all those participating emerged from the process with a deeper understanding of both the system they were working in and the perspectives of the other agencies involved. However, the participants were not at a senior enough level to be able to carry these conclusions and the new understanding back into their departments. This is a real problem where there are departmental and agency conflicts. Inevitably, when individuals have their awareness and understanding shifted, there is a follow through problem of translating the individual shifts into cultural shifts within departments or agencies. In general, the follow through is best when those involved in the systems work are at a sufficiently senior level to be able to influence the perspective and policies of their departments and agencies. But the senior people are often those who can least afford the time required to be active participants, as identified in the first issue.

The third issue is that despite many statements making it clear that systemic approaches are largely about improvements and not solutions, most of those involved in the project in the departments and agencies were looking for a *solution*. As a result, many were disappointed and probably were left with a view that the project had been a waste of time. This was particularly striking in the case of the system dynamics model where one of the senior commissioners was just not interested in an “answer” that said it would take between 20 and 40 years to address the issue!

The fourth issue is one familiar with many working with systems tools and approaches and is simply that in order for them to be used effectively, it is critical that they are understood and supported by the most senior managers or executives. A previous government review of the Lean Systems method concluded that for systems projects to be successful

> Managers must be supportive of the process. They need to be aware of, and understand, the work at an early stage and allow the review team unfettered access whilst carrying out ... the initial review of the service. The support of the Chief Executive and senior management is crucial in driving the changes in their organisations. (ODPM, 2005, p. 4)

These conditions were simply not in place for the Manchester project, and this author would not undertake a similar project again without ensuring a far greater level of understanding by the senior executives. Since the Manchester project there have been a wide range of systemic initiatives in the public sector in the UK that has resulted in a greater awareness of the requirements for success—and willingness for leaders to take risks.

Although the project did not have the level of impact we would have liked, it became clear in later discussion with officers in MCC that our contribution did support and foster what became known as the "twin track approach" to youth nuisance, an approach that established and enforced clear boundaries of acceptable behaviour whilst giving as much support as possible to families and children in deprived neighbourhoods where anti-social behaviour was a particular problem.

Acknowledgements

The author wishes to acknowledge the invaluable contributions of his collaborators: Sophia Parker and Hannah Lownsbrough at Demos and Dr.David Lane at LSE. He also thanks the Neighbourhood Renewal Unit and Manchester City Council for funding the project and all the people in Manchester and Whitehall who participated in the project.

Politics in a New Key:
Breaking the Cycle of U.S. Politics with a Generational/Developmental Approach

Ken White[1]

Abstract: Some common, mental models shape how people in the US perceive political changes over time. The one-dimensional pendulum swing model and the two-dimensional cyclical model are prevalent. When generational differences are mapped onto such political change cycles, they orient to cohorts or age groups. This leads to viewing generational cohorts as experiencing one- or two-dimensional cycles without deeper scrutiny. Cohort differences that surface in the Generations Salons that I and others conducted in California suggest a different, three-dimensional model may be more representative of the potential for societal change in the US. Using a musical metaphor, that model is explained in terms of different political "keys" and the value of distinguishing among them as time passes. It also underlies a speculation about a "politics in a new key," which might prove more useful.

Summary-level reporting of the action research conducted with the Generations Salons supports the three-dimensional model. We expect new politics to emerge from the Millennial cohort coming of age now, yet it will not be without the support and wisdom of the cohorts that came of age before it. This must be the case if the burden of expectations we place on the Millennials will indeed pave the way for transformative change in US society. Intergenerational support of Millennials is essential. This initial research and application suggests the potential for the generational/ developmental approach as a wellspring for transformational—and practically successful—political work. It begs the question: What will you do to help?

Keywords: Archetypes, developmental, generational, mental models, Millennials, political change, transformational.

SOME RIGHTS RESERVED

Stuck in Time

"Why are there no young people in the room?"

Like many activists, I've heard that *cri de coeur* (and its companion questions about women and people of color) many times—too many times—at political events. Looking around at this gathering of mostly earnest, progressive Baby Boomers, there seemed to me a blindingly obvious rejoinder: "Because they have a different model of political action!"

I fell into a conversation with the fellow sitting next to me about the apparent age divide, and he invited me to join a group of theorists and activists exploring ideas for "changing the political conversation."[2] Over the next several years, as part of a series of "Political Salons," this group explored (among other things) whether a generationally-based conversation could help point us toward a transformation in our political advocacy efforts…and in US political culture.

My interest in the potential for generational and developmental theory to make practical contributions to political action (and to help us improve the quality of our civic environment) grows out of 15 years as a professional political advocate, working almost entirely in the US.[3] I have worked with a political group whose average member age was over 70, as well as with high school and college organizing efforts, and with every age group in between. Not surprisingly, I have observed obvious differences in the "mental models" the various age groups bring to politics, based simply on their respective stages in life. But there also seem to be differences based on "generational cohort"—the group of peers you travel through life with, and with whom you share a broad range of experiences and perspectives.[4]

---

[2] This San Francisco Bay Area group (called the Praxis Tank for Progressives) grew out of a 2002 conversation initiated by Dean Elias, Kathleen Taylor, and Peter Dunlap (among others), driven by the question: "How can we change political culture?" In the years since, the group has hosted more than a dozen "Salons" where practical approaches to political work are "tried out" by a wonderful group of engaged (and engaging) political activists and activists-to-be from a variety of backgrounds, ages, and perspectives. The group was an essential proving ground for some of the concepts explored in this article, as well as in Peter T. Dunlap's book, *Awakening Our Faith in the Future: The Advent of Psychological Liberalism* (Routledge, 2008).

[3] This article draws specifically on US examples and theory—the only political culture I know well enough to write about. The specifics of both the theory and practice may not apply to any other culture or nation. However, it would be fascinating to learn if the general idea (and similar practices) of generational difference and potential alignment could be helpful elsewhere.

[4] A "generational cohort" is an often-self-defined group of peers with whom you identify, and with whom you move through various stages of life. Perhaps the most famous of these cohorts is the Baby Boomers, now in their mid-40s through mid-60s. In their youth, the Boomers catalyzed one of the most turbulent periods in American history, and now in their generative years they are trying to redefine aging. The difference between a "cohort" and an age group is that cohorts move together through time, while age groups are defined by characteristics that are common to a certain stage in life. For example, the basic characteristics of age groups like teens and 20s are intuitively obvious. It seems most everyone goes through adolescent turbulence in their teens; most everyone begins to take the future more seriously when they reach their 20s. Similarly, most everyone, upon reaching their 40s, begins to take dietary fiber more seriously; most everyone who enters their 60s begins to take their legacy more seriously; and so on. It is perhaps less obvious that different generational cohorts, as they move through these stages of life, will

I have also seen—and experienced—the suffering that comes with putting oneself into the political arena, and the chronic pain that can arise from confronting one of the most complex and convoluted challenges imaginable: changing the way we agree, collectively, to live together as a society. And I wondered if a generational/developmental perspective might help explain the sense of "stuckness" that so many of us experience in political involvement (as well as the sense of potential that arose from the more recent Obama campaign). It seemed worth exploring:

- If each of the generational cohorts understands and engages differently with politics;
- How the older generational cohorts could better understand, engage with, and support the rising Millennials (now in their pre-teen to post-college years);
- If the Millennials (together with the other generational cohorts) can translate the potential synergies among their differences into new forms of leadership and activism.

This article documents our experience working with a generational/developmental approach toward that goal. It begins with an introduction to the theory and "mental models" of political action, followed by a brief overview of the "Generations Salons" and how those events played out, and concludes with reflections and implications. This initial research and application suggests the potential for the generational/ developmental approach as a wellspring for transformational—and practically successful—political work.

Political Mental Models

The Millennials, often touted as the next "Greatest Generation,"[5] may actually have the potential to be that…and more. But if we simply slot them into a Greatest Generation role, and if we assume that the best way to develop their potential is to set them on well-worn political pathways—defined (and confined) by the "mental models" we bring to political activism—they may not have the oft-touted, but rarely-defined "transformative" effect. The limiting factor may not be the Millennials; instead, it could be the mental models we all use (mostly unconsciously) to help us make sense of the world.

In politics, American mental models tend to involve defined movement within clearly delineated boundaries. We often describe our experience of social and political change over time using metaphors that imply regular, rhythmic motions, such as ebbs and flows, or cycles, where lasting change occurs at a slow pace, if at all. Although these "back and forth/round and round" metaphors are not the only ones we use when thinking about politics, they are embedded in the language of political discourse as "pendulum swings" and the like. Beneath these descriptions are "mental models"—conscious or unconscious shorthand representations of reality that help us orient ourselves, make sense of reality, take action, interpret outcomes, and plan for the future.

---

have different perspectives and worldviews from other cohorts that have moved through these same life stages. So, for example, although the Baby Boomers will experience many of the same life stage changes in their 60s that members of the "Greatest Generation" experienced in their 60s, the Boomers will also have some unique perspectives and experiences based on their shared history as a cohort.

[5] The "Greatest Generation" refers to Americans who came of age in the Great Depression and World War II years, and reinvigorated the US democracy and economy in a time of peril.

One Dimension: The “Pendulum Swings Both Ways” Model

One simple but powerfully attractive way of thinking about American politics describes change as something that happens in a single dimension (Figure 1). Trends and preferences swing back and forth along a single straight line with more-or-less metronomic cadence: Democratic-Republican, liberal-conservative, etc. Beyond providing a pleasing sense of continuity and predictability, the one-dimensional model provides the comfort of boundaries and limits to extremism.

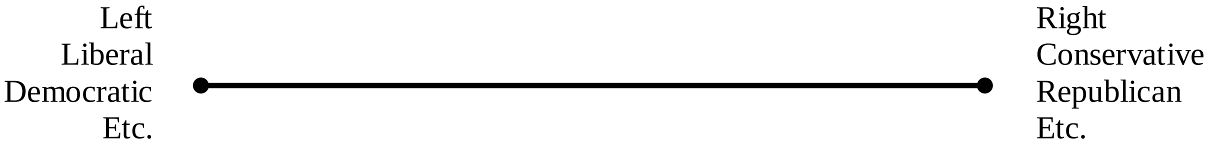

Figure 1. One Dimensional “Pendulum” Mental Model of US Politics

In this model, the length of the line—the total distance between the poles of “right” and “left” or “Democratic” and “Republican”—is fairly short, and the gravitational pull of the center is assumed to be quite strong. Extremists can never force things too far out of balance, and good old common sense keeps the majority opinion clustered around the midpoint…and along the line itself. Political action in this model consists of trying to get enough people and power to move, for as long as possible, toward your preferred end of the line.

More durable progress, in this model, comes only through slow, gradual migrations of the widely accepted midpoint itself along the line. Of course, the migration can go in either direction. So, from a one-dimensional perspective, “progress” can be defined as movement of the center toward either the “liberal” or “conservative” pole (or whatever terminology is used). Those on either side of a debate (and in this model, there is really only room for two sides of any debate) can always identify opportunities for what each perceives as the potential for long-term gains, achievable by moving the middle in their preferred direction.

Presumably, this combination of predictability, “boundedess,” and possibility of gradual progress makes the linear model acceptable to people and groups pulled toward the poles, as well as comforting to those drawn to the middle. The model “works” because it provides a stable framework for political activism. At the same time, it offers a sense of safety from erratic or dramatic shifts that might go “too far” in either direction along the line. In this model, the pendulum does not swing so far in one direction or the other that it can “break the frame” of the accepted consensus, and the majority of Americans can imagine themselves and their compatriots as clustered somewhere close to the center. Thus, this model generally “makes sense” to those who favor the relative security of slow, ordered change (or little change), as well as those pushing for relatively modest, incremental improvements.

Further, there is no need to make real distinctions among different generations, or among generational cohorts moving through time: although “young lions” eventually replace “old bulls,” the lions and bulls share fundamentally the same viewpoints at their respective ages. Both the model and the basic methods of political change hold constant, even if the personalities, parties, etc., shift over time. Political advocates need not look for and use differences among generations or cohorts, but simply “train up” rising young leaders in the received wisdom of the particular political viewpoint. This model seems to fit quite nicely with the recent spate of ”Generation X” Fundamentalist Christian parents sending their kids to summer camps that inculcate the 1980-90s Evangelical model of public activism, as well as the tendency among “Baby Boomer” Progressives to want young people to re-create the 1960s political culture and organizing methods. And, perhaps, the not-so-surprising outcome of many of the Millennial young people (politely) rejecting both of those models.

Two Dimensions: The “What Goes Around, Comes Around” Model

A more complex version of the linear view uses a two-dimensional cycle (Figure 2) as a metaphor. In this model, “everything has its season,” and every action leads—eventually—to an opposite reaction. Political trends and preferences may seem to come and go, but underneath it all, there is a predictable rhythm. This is roughly the political equivalent of “just stick around, bell bottoms will be back in style again in 30 years or so.”

As an example, the excesses of a Republican Congress give way to a rebirth of liberal activism, which then leads to the election of a Democratic President, who joins with a Democratic Congress to implement activist policies, which in turn triggers a conservative backlash, and so on and so on through time.

Like its one-dimensional cousin, this model has an appealing sense of stability, and even order. The downside of predictability is (seeming) inevitability: A causes B, which leads to C, and then on to D, which brings us back to A. Although there is room in this model for some gradual “progress,” the opportunities for enduring change in this cyclical model may seem in some ways more limited than in the linear world. Unintended consequences are not only unavoidable, they are expected.

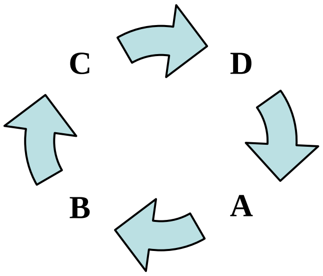

Figure 2. Two Dimensional “Cyclical” Mental Model of US

Carrying around this rather grim, Sisyphusian sense of how politics works may contribute to the burnout and disenchantment that so often claims political activists. Since you can’t freeze time, whatever progress you make is subject to—at best—only partial reverses as the wheel turns. And since the wheel won’t rotate all the way back for a couple of generations, well, political activism might seem pretty disheartening. However, this model does offer opportunities for some forms of progress, in three ways:

1. "Move the center.” As in the linear model, the center can and does gradually shift over time, taking the entire “cycle” along with it. And, as in the linear model, different people can and do define “progress” as movement in any direction, so change can and does happen—but so, of course, can reversion.

2. “Get what you can get, and then fight a rear-guard action against revanchism.” Most relatively mainstream groups profess to believe that their time will eventually come. And when

their moment arrives, they'll struggle to implement as many legal, structural, and procedural modifications as they can, and to make their moment last. This mental model might help explain some of the excesses that inevitably occur when an ideology, party, or generational cohort takes power: if a group's members believe (consciously or not) that their time in power will be brief and their gains reversible, it seems sensible to push their agenda as hard as possible for as long as possible. When their opponents retake power, they would quite logically fight to prevent their changes from being dismantled, while rebuilding their team and re-tooling for the moment when they can (finally!) reclaim power.

3. "Plan for the next war." From a cyclical viewpoint, progress can be made if groups avoid getting caught in the one-dimensional trap of building a Maginot Line to fight the last war. Instead, there is potential to create an insurgency that will replace the current order more quickly and more effectively this time around. This leads to strategies like "working smarter" and developing new, more conditions-sensitive leadership.

Although this model and its methods are not incompatible with the *language* of transformation, paradigm shifts, etc., the reality of using this mental model may well be (for very good and compelling reasons) that truly transformational change hovers chimerically on the horizon, while the stern tasks of grinding out progress and preventing losses predominate.

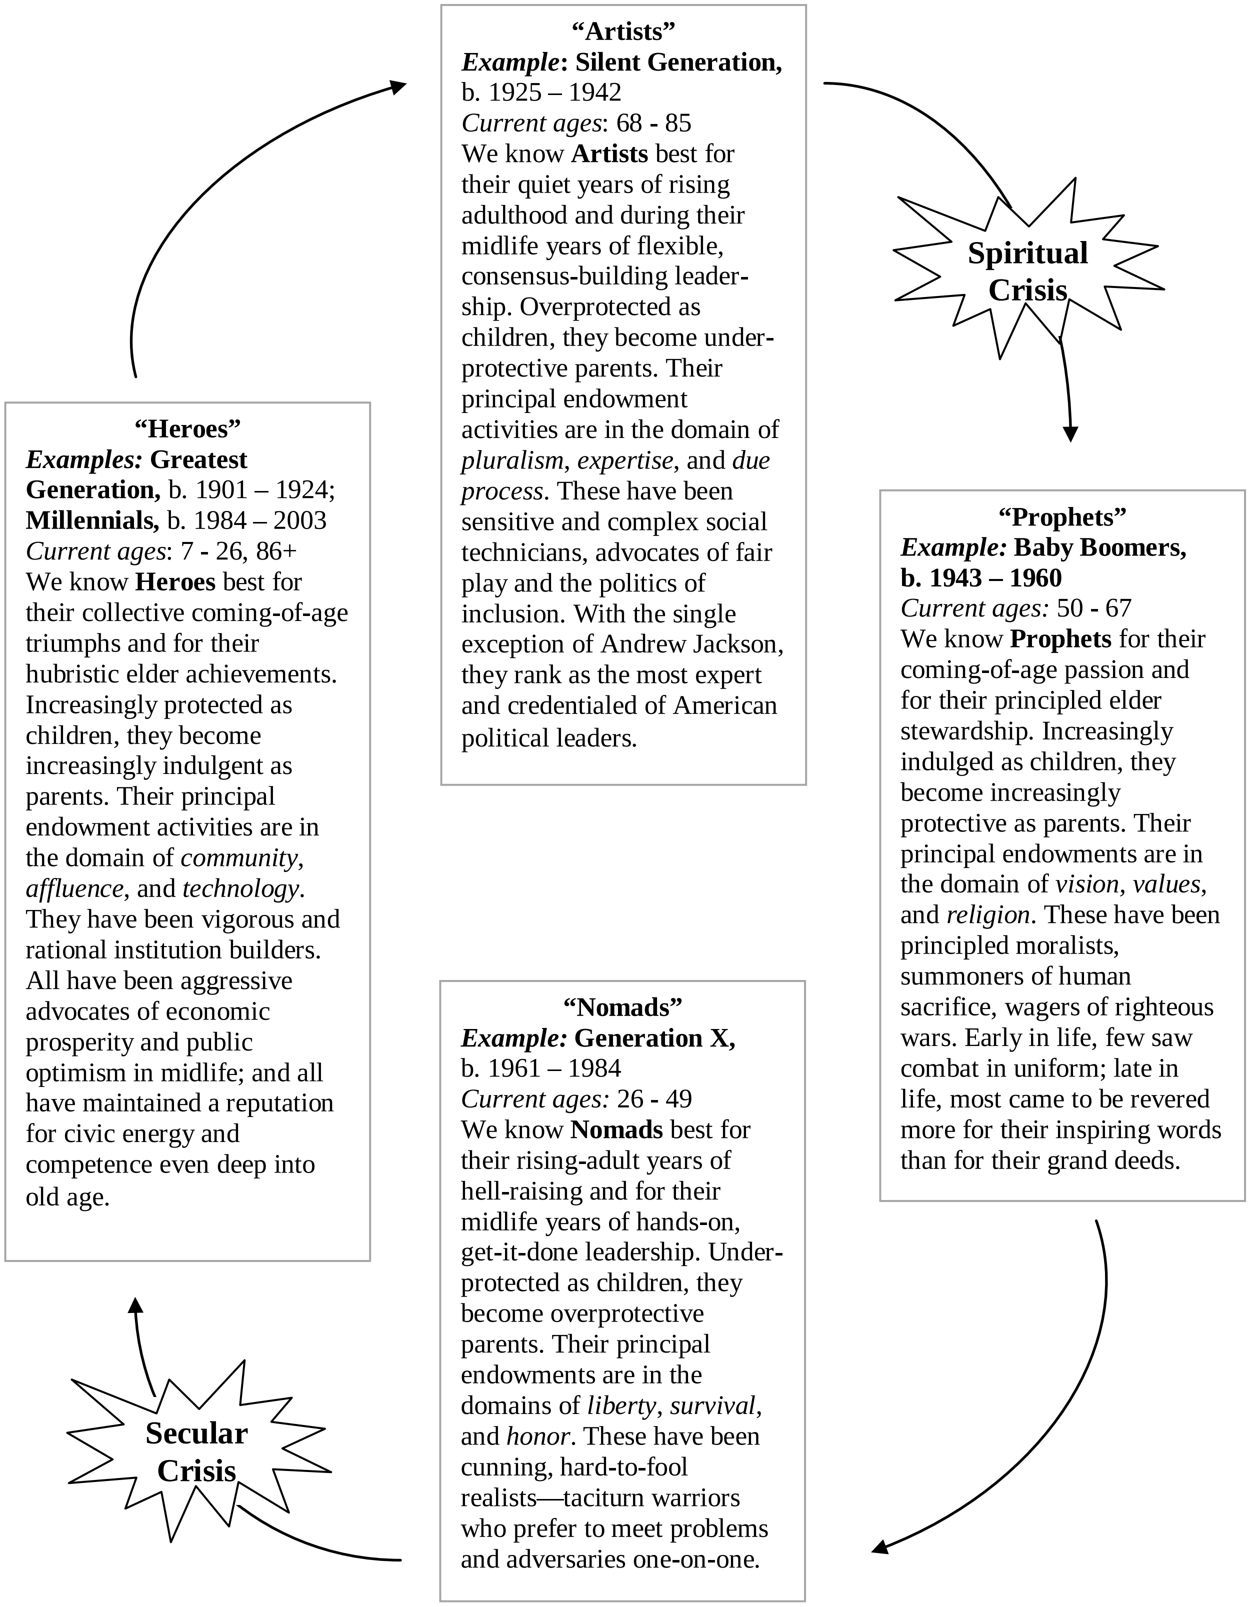
Two Dimensions: The Strauss & Howe Model of American Political Cycles

One of the most compelling examples of the cyclical model of American democracy comes from William Strauss and Neil Howe (1991, 1997). In *Generations, Fourth Turning,* and subsequent writings,[6] they posited that four generational archetypes (Heroes, Artists, Prophets, and Nomads—see Figure 3 for details) recur over and over in the US, in predictable generational cycles of roughly 20 years. They assert that each of these generational cohorts reacts both to the cultural climate created by the preceding generations, and to the larger climate (e.g., global, technological, etc.) in ways that are broadly predictable, based on their place in the generational archetype cycle.

Further, Strauss and Howe posit that there are also cycles in the types of challenges facing American society, which correspond to the archetypes of the generational cohorts leading the response to these circumstances. So, they argue, a "Hero" cohort like the Greatest Generation faces (or raises up) a "Secular Crisis" like WWII, during which Americans must band together to overcome. The resolution of the "Crisis" Era leads to a "High" Era of broad consensus and repressed conflict dominated by "Artists," such as the late 1940s through the early 1960s when the Silent Generation came of age in the time of the GI Bill and *Father Knows Best*. Following this, the rising "Prophet" generation then initiates a "Spiritual Crisis" that leads to an "Awakening" Era, as the Baby Boomers did when they called into question the core values of American society during the 1960s and 1970s. In turn, "Nomads" like "Generation X" endure an "Unraveling" Era, like the crime-obsessed, me-first, "Greed is Good" era of the 1980-1990s, which leads to the next "Secular Crisis" and "Crisis" Era, and the rise of another "Hero" cohort,

---

[6] For example, see www.fourthturning.com.



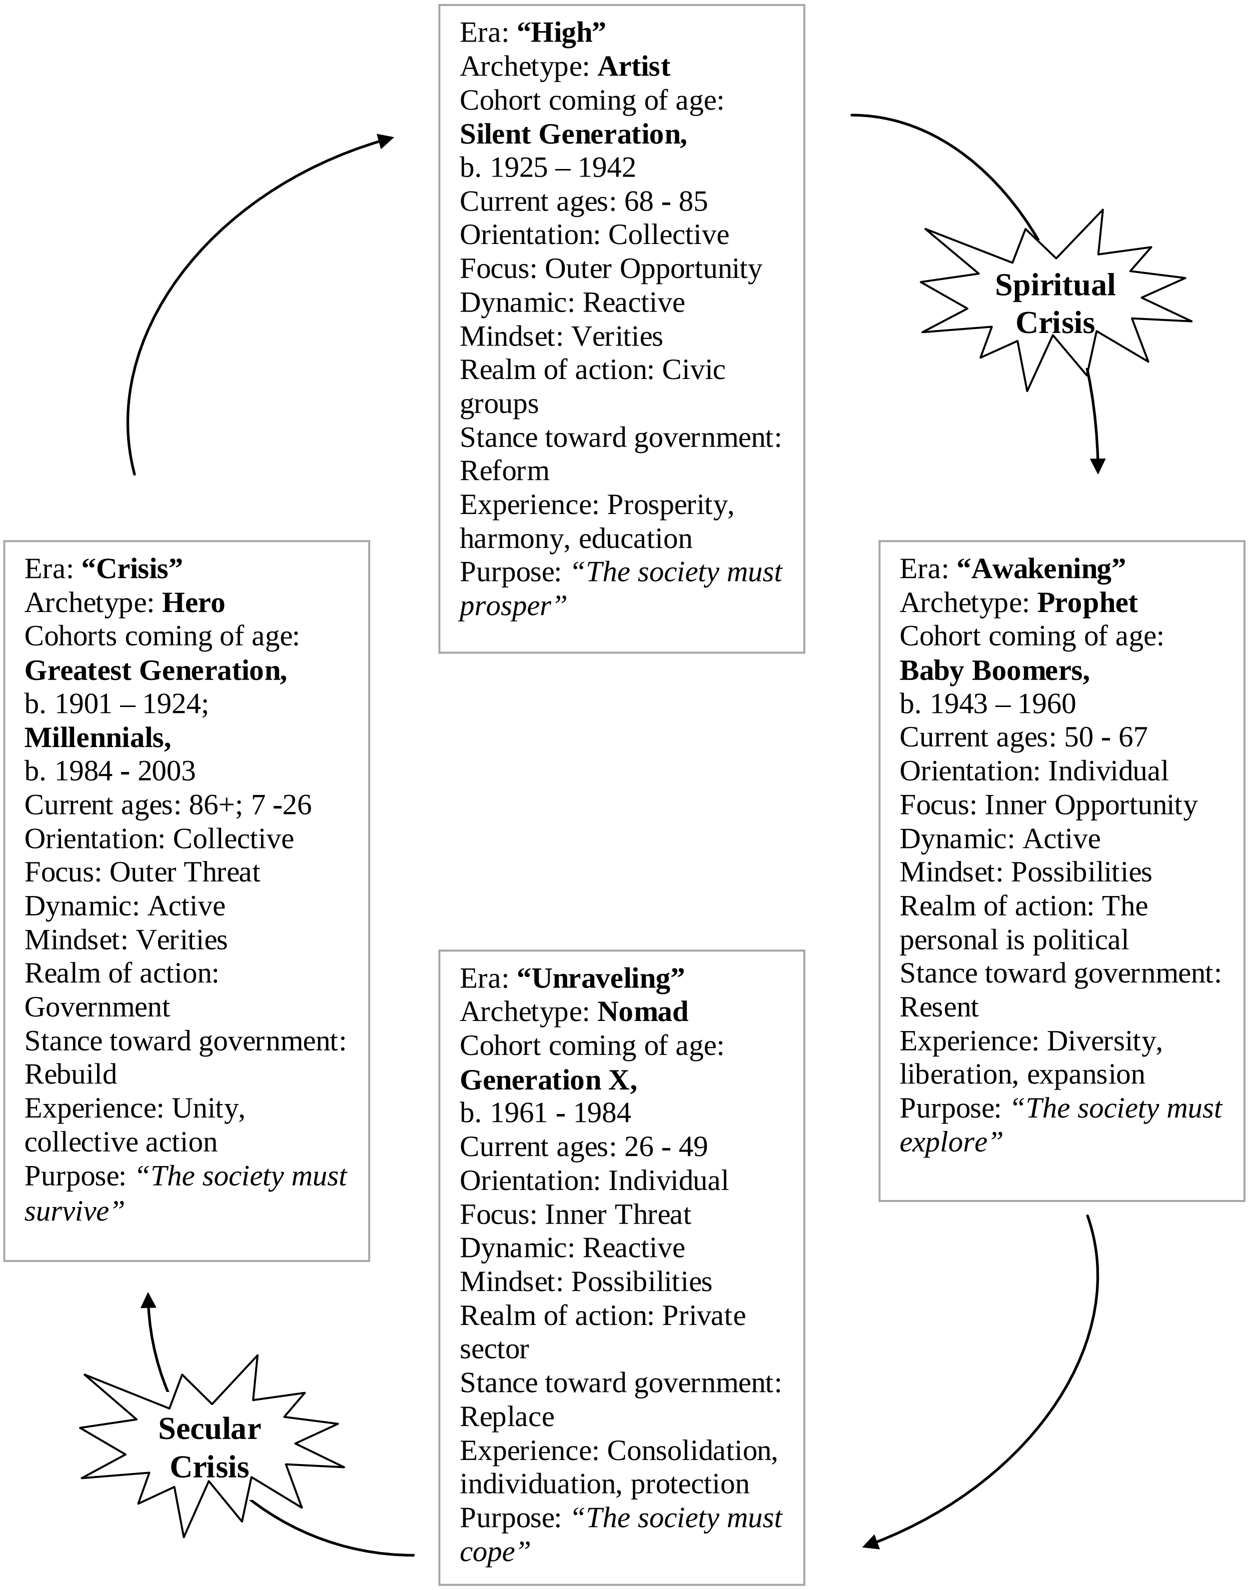
“Artists”
***Example*: Silent Generation,**
b. 1925 – 1942
Current ages: 68 - 85
We know **Artists** best for their quiet years of rising adulthood and during their midlife years of flexible, consensus-building leadership. Overprotected as children, they become underprotective parents. Their principal endowment activities are in the domain of *pluralism*, *expertise*, and *due process*. These have been sensitive and complex social technicians, advocates of fair play and the politics of inclusion. With the single exception of Andrew Jackson, they rank as the most expert and credentialed of American political leaders.

“Prophets”
***Example:* Baby Boomers,**
b. 1943 – 1960
Current ages: 50 - 67
We know **Prophets** for their coming-of-age passion and for their principled elder stewardship. Increasingly indulged as children, they become increasingly protective as parents. Their principal endowments are in the domain of *vision, values*, and *religion*. These have been principled moralists, summoners of human sacrifice, wagers of righteous wars. Early in life, few saw combat in uniform; late in life, most came to be revered more for their inspiring words than for their grand deeds.

“Nomads”
***Example:* Generation X,**
b. 1961 – 1984
Current ages: 26 - 49
We know **Nomads** best for their rising-adult years of hell-raising and for their midlife years of hands-on, get-it-done leadership. Underprotected as children, they become overprotective parents. Their principal endowments are in the domains of *liberty*, *survival*, and *honor*. These have been cunning, hard-to-fool realists—taciturn warriors who prefer to meet problems and adversaries one-on-one.

“Heroes”
***Examples:* Greatest Generation,** b. 1901 – 1924;
Millennials, b. 1984 – 2003
Current ages: 7 - 26, 86+
We know **Heroes** best for their collective coming-of-age triumphs and for their hubristic elder achievements. Increasingly protected as children, they become increasingly indulgent as parents. Their principal endowment activities are in the domain of *community*, *affluence*, and *technology*. They have been vigorous and rational institution builders. All have been aggressive advocates of economic prosperity and public optimism in midlife; and all have maintained a reputation for civic energy and competence even deep into old age.

Figure 3. Two-Dimensional Generational Archetypes in Current American Life
(from Strauss & Howe’s *Fourth Turning, (1997, pp. 95-97) and other sources*)



Era: **"High"**
Archetype: **Artist**
Cohort coming of age:
Silent Generation,
b. 1925 – 1942
Current ages: 68 - 85
Orientation: Collective
Focus: Outer Opportunity
Dynamic: Reactive
Mindset: Verities
Realm of action: Civic groups
Stance toward government: Reform
Experience: Prosperity, harmony, education
Purpose: *"The society must prosper"*

Era: **"Awakening"**
Archetype: **Prophet**
Cohort coming of age:
Baby Boomers,
b. 1943 – 1960
Current ages: 50 - 67
Orientation: Individual
Focus: Inner Opportunity
Dynamic: Active
Mindset: Possibilities
Realm of action: The personal is political
Stance toward government: Resent
Experience: Diversity, liberation, expansion
Purpose: *"The society must explore"*

Era: **"Unraveling"**
Archetype: **Nomad**
Cohort coming of age:
Generation X,
b. 1961 - 1984
Current ages: 26 - 49
Orientation: Individual
Focus: Inner Threat
Dynamic: Reactive
Mindset: Possibilities
Realm of action: Private sector
Stance toward government: Replace
Experience: Consolidation, individuation, protection
Purpose: *"The society must cope"*

Era: **"Crisis"**
Archetype: **Hero**
Cohorts coming of age:
Greatest Generation,
b. 1901 – 1924;
Millennials,
b. 1984 - 2003
Current ages: 86+; 7 -26
Orientation: Collective
Focus: Outer Threat
Dynamic: Active
Mindset: Verities
Realm of action: Government
Stance toward government: Rebuild
Experience: Unity, collective action
Purpose: *"The society must survive"*

Figure 4. Characteristics of Generational Archetypes and Corresponding Eras Leading up to the Present, and Projected into the Future
(extrapolated from Strauss & Howe's *Fourth Turning* and other sources)

projected to be the Millennials. Figure 4 extrapolates further from the basic Strauss and Howe model, suggesting ways that generational cohorts and the corresponding eras might be distinguished.

As these cohorts move through time, each appears to have quite distinctive ways of expressing values and principles, favored forms of action, preferred realms for intervention, etc. For example, the Silent Generation populated many of the large national civic groups like the ACLU and the League of Women Voters; whereas many Gen Xers have turned their successful private sector experiences to re-tooling the nonprofit world.

Although careful to avoid determinism, Strauss and Howe suggest that there is some predictability in the general contours and broad trends of American life. Quite wisely, they do not say how those trends will actually play out in each generational cohort or particular period in the future, just that certain patterns will reappear, predictably, time and again. The Strauss and Howe model picks out of the seemingly chaotic noise of the American Experience an *underlying rhythm and a simple melody*. The task of political advocates, it follows, is to dance to the pulse of the times by understanding the characteristics and configurations of both the rising generation and the generations currently in power, as well as the prevailing—and rising—mood of the country. A kind of “musical sensitivity” helps political advocates get ahead of trends by getting a feel for the (approximate) future, and gives them an edge in the three core political activities of the two-dimensional, cyclical model: shifting the center; fighting rear-guard actions; and building for the next war.

Of course, this model has its weaknesses. Beyond its limitations as a hugely broad-brush approach, the Strauss and Howe model begins to show cracks when the authors extend it back into pre-American Revolution “Anglo-American” history. Although on the surface their evidence seems intriguing, this reach into history may be more confusing than illuminating, for reasons outlined later in this article. Similarly, any attempt to project this kind of American particularism too far into a future seems unwise. We appear headed toward an era of greater interdependence, and we may be poised for some unimagined leaps forward (or backward) into dramatically different ways of life.

Finally, the reference to “Anglo-American” history points to the absence, in Strauss and Howe’s theory, of the experiences and impact of the many immigrants not “assimilated” into Anglo-American history and culture, as well the many people in the US who do not conform to the majority culture. But although Strauss and Howe look primarily at “Anglo-American” culture, similar distinctions seem to crop up outside of the mainstream culture as well. For example, some commentators have suggested familiar-sounding contrasts between the “Civil Rights Generation” (Baby Boomer) and the “Hip-Hop Generation” (Gen X) among African-Americans (see, for example, Goff, 2008; Kitwana, 2003), and interesting differences among different generations of gay men have also been proposed. Their theory does not address at all recent immigrants and their families (about 10 percent of the US population), who seem likely to be influenced as much (if not more) by their experiences outside of American culture as by their US-born generational cohorts.

Three Dimensions: The "Singing in a Higher Key" Model

The "cyclical model" above has both a stable rhythm (a new generational cohort appears every 20-25 years) and a predictable, repetitive melody. Viewed from above (as in the two-dimensional model shown in Figure 2), it portrays a harmonious repeating cycle over time.

But what if those patterns that Strauss and Howe observed were plotted in three dimensions, adding a developmental axis (Figure 5)? Would the American historical cycles (and the cycles in "Anglo-American" history before them, and those of the potential future beyond) reveal a different kind of pattern? Would this perspective suggest the potential for more enduring change, perhaps even societal transformation? Could this kind of "perspective shift" help us imagine politics being sung in a "higher key?"

Imagine trying to record on paper the output of a musician playing four notes over and over again, but without using the standard musical staff (the grid of lines used for writing music). Even if the musician changed to a different key, the pattern of the written notes would look the same, without the context of a grid to indicate pitch and direction. From this sort of two-dimensional perspective, a "do-re-mi-fa-do-re-mi-fa" melody would look just like an "mi-fa-la-ti-mi-fa-la-ti" melody or a "la-ti-do-re-la-ti-re-do" melody.

Add the staff, however, and the notes from the different melodies would appear in different places, making changes in key obvious, as well as any differences in the notes and patterns, and the direction of the music. From this three-dimensional vantage point, a similar quantitative melody (four notes in a repeating, cyclical pattern) would have a *large qualitative difference*.

In the first iteration of their theory, Strauss and Howe suggested a timeline of "cycles" that began around the time of the exploration and colonization of North America—a time of tremendous religious, political, scientific, philosophical, psychological, and societal upheaval. The Scientific Revolution, the Reformation, the American Revolution, all created conditions that made possible profound, fundamental changes in how individuals and societies perceived themselves and their relationships to each other.

Arguably, these were times of developmental shifts in both individuals and societies (and the governments created by these people, as in the emergence of American democracy). In these conditions, it seems plausible that a new societal "cycle" (like the melody in the example above) might have begun, perhaps replacing an earlier one, or—more probably—overlaying and building upon an earlier one. So, although the basic pattern of the cycle could appear to remain the same, the new cycle might instead be repeating in ways that corresponded with the new, more complex challenges that people and the society were experiencing. The cycle may have "changed keys" from the previous one, even though the basic patterns may have remained similar. In this way, although the cyclical patterns the American colonists inherited from the generational cohorts of medieval England (and Europe) might appear to roughly correspond in *archetypal form*, the old and new patterns might, upon closer examination, have a very different *context and content*.

However, trying to capture that difference in a two-dimensional model would probably result in these quite different cycles looking—and being represented—much the same. Even though a profound change may have shifted the society from an older, stable, medieval, monarchic "A-B-C-D-A-B-C-D" cycle to a newly stable, modern, democratic "C-D-E-F-C-D-E-F" cycle, the two-dimensional Strauss and Howe perspective would not capture this upheaval (e.g., compare the "Two Dimensional" model of Figure 2 with the "Three Dimensional" model shown in Figure 5).That type of "developmental shift" might best be represented in the "widening spiral" model shown in Figure 5, where although the cyclical pattern is repeated, it repeats at a level that encompasses a wider range of experience, and a greater degree of complexity and challenge.

Although it required a dramatic shift in individual and collective perspective to move from living as monarchic subjects whose sole duties were fealty, to becoming democratic citizens facing far more complex demands, a "two-dimensional" model cannot and does not account for this kind of change. In the Strauss and Howe world, a cohort of medieval serfs in 16th century England are of the same "archetype" as Internet-buzzing Americans of the 21st century—and that same archetype is projected to return again in the 23rd century. Although it is true we still read Shakespeare and the Bhagavad Gita because some aspects of human nature and experience remain timeless, in many other important ways, people and the societies we create have evolved to levels of far greater complexity.

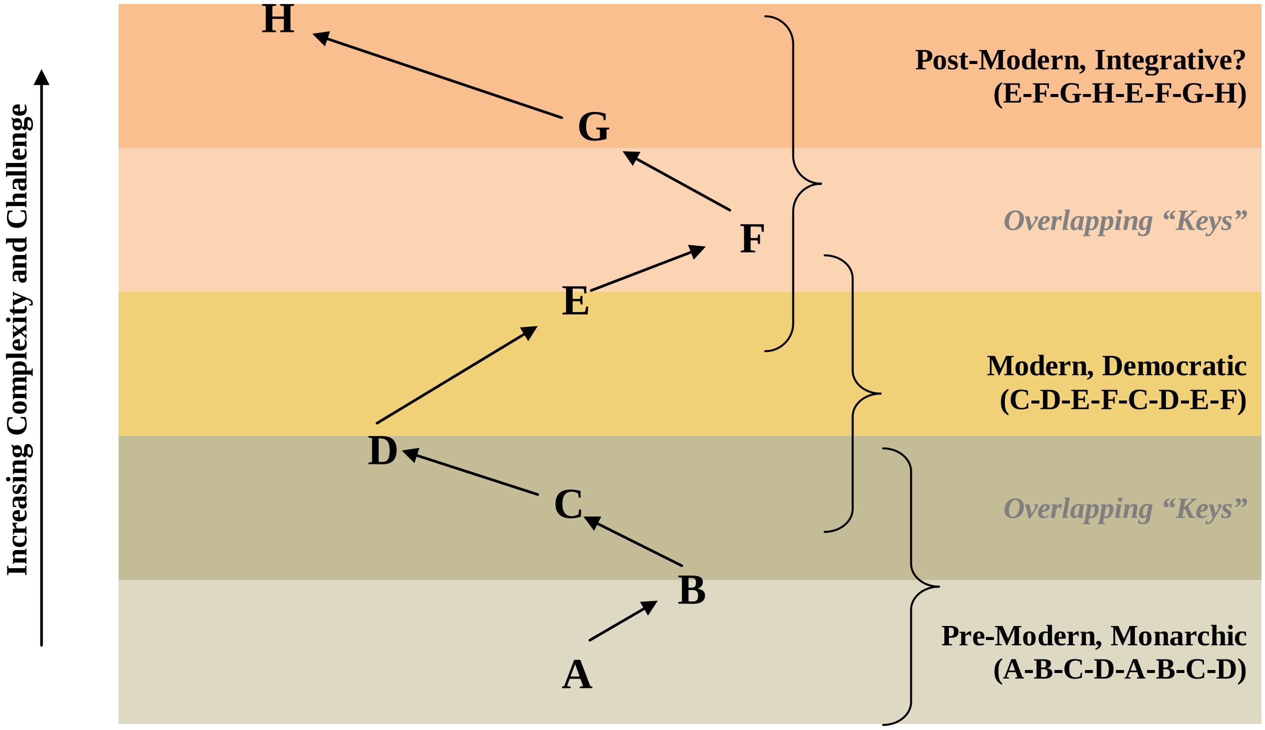


Figure 5. Three-Dimensional "Spiral" Mental Model of U.S. Politics

This, it seems, highlights the weaknesses of employing just a two-dimensional representation of both ”Anglo-American” and American historical cycles, and of projecting too far forward into the future. First, as many have argued, the American Revolutionary period corresponded with a (however imperfectly realized) developmental shift for individuals, societies, and governments. So whatever relationship there may be among generational cycles going back into “Anglo-American” history and forward into the future, although the “melodies and rhythms” may be similar, they may actually be “played” in different developmental “keys.” That is, a Hero generation might have appeared every 80 years or so in Medieval England, just as a Hero generation might have appeared every 80 years in the post-Revolutionary US. However, the US Heroes of the 18th-20th centuries would face much denser (intellectually, emotionally, psychologically, etc.) challenges than those that faced their 14th-17th century English counterparts. The modern, US Heroes (or any other generational cohort of the modern United States) would have to “sing” a similar song, but in a “higher key” that corresponded to the greater level of complexity and challenge in the world around them

Second, viewing the generational cycles through a two-dimensional lens limits the potential for imagining a developmental shift upward (as well as the tragic possibility of a developmental shift downward). Lasting change, in this view, can only occur by “moving the center.” Third, understanding the generational cycles as two-dimensional limits considering the potential for developmental growth *within* the cohorts and cycles, where each cohort might attempt to build on the advancements of previous cohorts, without falling prey to the pitfalls created by the previous generations’ efforts—and thereby repeating the inevitable cycle.

Three Dimensions: Accounting for Generational Cohorts

So, then, what advantages would a three-dimensional model offer (Figure 5)? First of all, as George Box famously noted, all models are wrong, but some models are useful.[7] The three-dimensional model’s usefulness lies not in how well it corresponds to reality (like the other models, probably not so accurately), but in whether it enables us to think differently about the potential for political change, and our ability to help catalyze that change.

In political advocacy, the three-dimensional model has the obvious appeal of allowing a greater amount of progress in more dimensions—people and cohorts (as well as movements and political parties) can grow not only within their existing contexts, but also grow into more complex, nuanced modes of understanding and acting. The three-dimensional model suggests a more open pathway of possibility.

At the same time, it does not completely break with the one- or two-dimensional models. Instead, it builds on the familiar “moving along the line” and “things go in cycles” orientations, by adding another dimension. As an extension of already-established patterns in the political culture, the three-dimensional model offers a progressive, logical pathway to a different way of understanding politics, which (seemingly) could be quite accessible to those comfortable with the one- and two-dimensional models. The changes in this model grow out of the received tradition of values, patterns, and structures, and continue along a roughly similar (although widening and rising) circular pathway. The model has the added advantage of not requiring *everyone* to rise to some new level; it also suggests that simply changing and growing *within* a generational cohort (or party, ideology, etc.), can also contribute to the general progress.[8]

---

[7] There are, of course, other “three-dimensional” models of politics. Most, however, are static, and simply create models with two (or sometimes more) axes that locate political opinions, parties, and ideologies in spatial relationship to each other. Some of these axes include “liberal-conservative,” “libertarian-communitarian,” “cosmopolitan-nationalist,” “individual-group,” etc. Although useful for mapping, these essentially static models alone offer little insight on pathways toward change and progress over time.

Exactly what all these changes might look like, and how it would happen, of course, are at this point speculative. Of course, it's tremendously tempting to load up the rising generation with a wheelbarrow-full of familiar issues, policies, and positions. However, assuming that "the future will be just like the present, only more so," would be more in line with the one- and two-dimensional models, and might close out the range of possibilities by focusing on the *content* before first understanding the *context*. And the context that came to light through working firsthand with members of the various generational cohorts revealed some unexpected information to me and my colleagues.

Action Research: The Generations Map Themselves

At first, I was tempted to "map" various developmental theories and stages onto Strauss and Howe's archetypes and cycles. This yielded some intriguing possibilities, but it seemed unwise to force too much of an "apples and oranges" comparison. Although (for example) the Greatest Generation and the "Secular Crisis" it survived in some ways appear to match the characteristics of a "Red/BLUE" ("Spiral Dynamics") or "Imperial II" (Kegan) orientation, the nuances of reality cautioned against simply slapping a developmental stage label onto an entire generational cohort and/or moment in history. [9]

Besides, each generational cohort, in conjunction with the other generational cohorts alive at the time, will face challenges at a multitude of developmental levels, and each has the option of responding at a multitude of levels. For example, the Depression and WWII presented both a survival threat (severe poverty and world war) and an existential threat (responding to the Fascist manifestation of evil) to the Greatest Generation. For very good reasons, most Americans chose to subsume the latter in the interest of solving the former, and focused on the formidable challenges of rebalancing the economy and "making the world safe for democracy." The Cold

---

[8] This explicitly developmental perspective on change is quite often absent from existing political advocacy efforts. Some advocates measure effectiveness by results, regardless of motivations; support for a goal is their desired outcome, not necessarily transformation, Other political advocates see success as changing the perspectives and worldviews of others, leading to alignment in both philosophy and action. The three-dimensional model opens the possibility for a "both/and" approach, where both growth within an existing worldview *and* a movement to a new worldview can support a political development process.

[9] Many different developmental models appear, at least on the surface, to share similarities with the generational cohort cycles outlined by Strauss and Howe. Some of the most familiar, like those created by Robert Kegan (1991) and Clare Graves (whose model was extended and popularized by Beck and Cowan's (1996) *Spiral Dynamics*), have been applied in circumstances like this, as interest in adult development has increased. However, as Sara Ross (2008), among others, suggested, similarity on the surface often masks great difference at the core, and cross-comparisons often decrease specificity and increase the potential for misunderstandings.

War presented similar developmental challenges, but the Silent Generation, for both practical and preferential reasons, focused more intently on the existential threat of competing ideologies and the very real possibility of global annihilation.

Therefore, instead of creating a complex theoretical framework for our work with the "Generations Salons," I decided to focus first on what was fairly obvious: people could self-identify easily into generational cohorts like "Baby Boomers" and "Gen Xers." In our first attempts to use this conceptual framework with a group of politically engaged people, we chose not to present a theory to the group and then ask them to discuss the implications. Instead, we asked people, together, as generational cohorts, to create and weave together their own developmental narrative out of their individual and combined "political coming of age stories." By sharing these stories across the generational cohorts, we hoped the developmental challenges and opportunities might become apparent.

Our intent was to create an opportunity for each generational cohort to claim its unique identity, and then encourage all the generational cohorts to fit their experiences into a larger story that defined "how we got here," which would then imply the possibility of creating a different way of imagining "where we want to go next."

Our hope was that a sense of the possibility for enduring change offered by the three-dimensional model would emerge as the groups created open-ended narratives of their own development as individuals, as generational cohorts, and as members of a larger society. Rather than seeing their primary tasks as "moving the center" or "holding the line," we hoped they could discover a sense of progress, possibility, and opportunity. In particular, we hoped that by placing the Millennials at the "open end" of the narrative, the potential for leadership by this generational cohort (and the need for support from the other cohorts) might become a focal point of the conversation.

Theory in Action: A Conversation among the Generations

The "Generations Salons" we hosted are part of an ongoing series of events developed by a San Francisco Bay Area group that formed in 2002 around the question: "How can we change political culture?" In the years since, the group has hosted more than a dozen Salons and workshops where practical approaches to political work are "tried out" by a wonderful group of engaged (and engaging) political activists and activists-to-be from a variety of backgrounds, ages, and perspectives. For these Salons, we tried to have at least three or more members of each current generational cohort (Silent, Boomer, Gen Xers, and Millennials) participating. We asked participants to gather in their generational cohorts and create a narrative of their individual and combined "political coming of age" stories. We then shared these stories among the generational cohorts, beginning with the oldest and moving thorough time to the Millennials, telling a collective story of "how we got here," with the implied possibility of imagining "where we want to go next." The general format follows.

1. A brief introduction of the context, the topic, the format, and the people.

2. Divide into four groups by generational cohort.

3. Ask each individual, and each cohort, to come back to the large group prepared to tell a story about some combination of these items (different variations of the below were tried at different Salons):

- Your experience when you felt your cohort "came of age" politically.
- Your generational cohort's landmarks (events, people, milestones, reference points, zeitgeist, metaphors, etc.).
- What your generational cohort is passionate about.
- What you inherited from previous cohorts, both with gratitude and with regret.
- What you hope to pass on to the next cohort(s), and what you hope they will *not* inherit from you.
- Your best advice for the next generational cohorts(s).
- Your generational cohort's task…and its burden.

4. Bring the separate cohorts together into a large group again, and ask the oldest (Silent) cohort to begin by telling their story. When the Silent Generation's story reaches their "political coming of age moment," they pass the narrative thread to the next-oldest cohort (Boomers), who repeat the process. The thread passes through the Gen Xers, and on to the Millennials, who are just now experiencing their "political coming of age," and are only beginning to project themselves and our society into a possible future.

5. Invite reflection and conversation on what this experience evoked. For example:

- For the older cohorts, reflect on how the younger cohorts unfolded what you helped create, and your own role in that unfolding.
- For the younger cohorts, reflect on how the world created by the older cohorts influenced your own choices.
- How could we use this experience to change our political culture?
- What can the generational cohorts individually and collectively contribute to the rising Millennials and their potential for leadership?
- Do we want to help the rising cohort of Millennials repeat familiar patterns, or is there potential to move up to a higher level of development?

6. Invite actions to help "step into the future."

From these Salons emerged dramatically different stories than those so often told at political gatherings based on ideology, issue, or political party. As the narration passed from one generational cohort to the next, we experienced the historical forces that had shaped us, and how our actions had shaped history, other generational cohorts, and our shared culture. This illuminated how differences and commonalities had emerged, and why they matter. This new perspective revealed the development of individuals and generational cohorts moving through time—and showed that political identities and worldviews are neither as fixed nor as exclusive as conventional political labels suggest.

The Millennials, in their turn, revealed their potential to shift toward a new and quite compelling future. We also saw how all the cohorts may have misunderstood what each could offer to help the Millennials seize this opportunity, and gained a quite different perspective on their capacity to re-think some aspects of their political identities and strategies.

The Generations in Action and Reflection

At each of the Salons, the participants identified the need for more opportunities for members of *all* generational cohorts to experience their potential for growth and leadership, and particularly for engaging with the Millennial Generation. Each of the older cohorts—Silent, Boomer, and Gen X—recognized that they possess unique insights, knowledge, experience, as well as blind spots, all of which will influence the emergence of the Millennials. The older generations expressed an intense yearning for the younger generations to build on their triumphs. But the younger generations seemed to have more interest in learning from what the members of each cohort have learned in their passages through fire and from confronting their shadows.

Although common sense dictates that each generational cohort should pass on both values and lessons learned, the very human tendency is to emphasize hard-won victories and ignore difficult, unresolved issues. In turn, although successive cohorts ought to incorporate the wisdom proffered by their elders, they have often learned as much from what was kept in the dark as they did from what was held up to the light. This—along with the mental models that limit options for growth and development—may well contribute to our political system's continual recycling of past mistakes, and the experience so many political activists have of "beating our heads against the wall" with familiar yet often-ineffective strategies. Our political development may be stunted and our options for action limited—in stark contrast with the perspective shifts and methodology changes (reflecting greater complexity and developmental growth) that have propelled advances in so many other areas like science, business, and technology, for example.

Since our political approaches rarely match the overt rhetorical language of politics (e.g., "New Ideas!", "Moving Forward!", "A Brighter Future!"), there must be some significant obstacles to developing alternative mental models and using a generational cycle of learning and growth as a springboard to political development outside of fora like our Salons. No doubt, many of those obstacles are "external," perhaps the most significant being existential threats to security and prosperity (like the reaction to 9/11, the growing economic stratification/instability, and potential catastrophes from global climate change). Some of the "internal" ones seem equally intractable, like the re-emergence of right-wing extremism and religious beliefs that reject modernity (let alone postmodernity!) out of hand. And, of course, the existing mental models for political change (as described earlier), are difficult to supplant, if for no other reason than that they are familiar, and we seem to have constructed an entire political system on their basis.

Emerging from these Salons, however, is the potential for a new generational cycle, led by the Millennials, with the support and guidance of the older cohorts. As in the three-dimensional model shown in Figure 5, however, generational cohorts may have to learn to "sing" their particular notes in "higher keys," replacing, for example, the expected "C" in the two-dimensional "C-D-E-F" cycle with a new, "G" note. Exactly what a "G" note might sound like, and how it would be "sung" are beyond the scope of this article. However, Table 1 lays out some speculative characteristics of a possible new kind of "Hero" archetype compard to that shown in Figure 4. Its members might "sing" this new note, if offered the right kind of support, and the freedom to express themselves.

After all, one cohort, acting alone (as the participants in the Salons pointed out), does not possess the capacity to undertake that kind of transformation. A generational cohort only just coming of age, like the Millennials, needs the received wisdom, values, and traditions of the previous generations to build upon, as well as the opportunity and resources to generate alternatives. The Millennials need members of the other generational cohorts to break out of the one- and two-dimensional models, and offer the rising generation a context in which a "higher key" becomes a real option.

From the evidence of these Salons, it appears that multi-generational, multi-perspective experiences could become the basis for long-term constituency building, as well as a platform for helping older generational cohorts find truly useful ways to participate in a different kind of political environment. We especially need to explore if and how this framework applies among a variety of people and communities, with particular attention to recent immigrants and their children.

Table 1. New Hero Archetype Response in a New Key to a "Crisis" Era

Characteristics	"Old Key" Response to Secular Crisis (Figure 4)	"New Key" Response to Secular Crisis
Era	"Crisis"	"Crisis"
Archetype	Hero	*New* Hero
Cohort(s) coming of age	Greatest Generation, b. 1901 – 1924	Millennials, b. 1984 – 2003
Current ages	86+	7- 26
Orientation	Collective	Transpersonal?
Focus	Outer Threat	Integration?
Dynamic	Active	Reflective Action?
Mindset	Verities	New Verities?
Realm of action	Government	New forms of governance?
Stance toward government	Rebuild	Reimagine?
Experience	Unity, collective action	Integration, interdependence, complexity?
Purpose	*"The society must survive"*	*"The society must evolve"?*

It also appears there may be some "generational tasks" appropriate for each of the generational cohorts (as sketched out speculatively in Figure 6) that can help to create this kind of context. It may be that the overarching purpose of these tasks is to support the Millennials in their potential to become transformational leaders. Obviously, the Millennials cannot accomplish this alone—they need to find ways to engage the entire society. So each cohort must embrace a leadership role. However, those leadership roles might be quite different from those we often assume—in particular those roles that have become associated with our cohort's place in the generational cycle (as outlined in Strauss and Howe's research).

Supporting the Generational Leadership of the Millennials

So why are there no young people in the room? It may have something to do with the mental models employed—consciously or unconsciously—by whatever generational cohort(s) dominates a given political organizing effort.

If the older organizers of political activism hold the one-dimensional model, the only advice they can offer young people is: “Do what we did, but more effectively.” Since there are no essential differences among the generational cohorts in the one-dimensional view, the only changes that matter are the changes that happen to “it” (where “it” is a political party, Congress, society, etc.). So, although there may be some “fixes” that can be implemented that differ from the “fixes” of previous generations, these differ mostly at the level of tactics, rather than strategy. Certainly, these “fixes” don’t require much of a shift in our understanding of public life, and don’t offer much beyond the potential for incremental change.[10]

If the older generational cohorts—unconsciously or consciously—are using a two-dimensional model, they are likely conveying to the rising generation: “Here, kid—it’s your turn to push this rock uphill. It’s gonna run over you its way back downhill soon enough. But hopefully it will come to rest a little higher up the hill than the last time, so the next generation will have a slight head start compared to you and me.” As in the one-dimensional model the underlying “game” rarely changes, and the players themselves never have to change internally—they simply have to adapt to new circumstances. Working harder or smarter suffices for a strategy. Rethinking the premises, or “coloring outside the lines” (or even re-drawing the lines) are not really options. Everyone’s too busy trying to recapture the moment when the rock reached its apex, and then push as far beyond that point as is possible before gravity takes its toll.

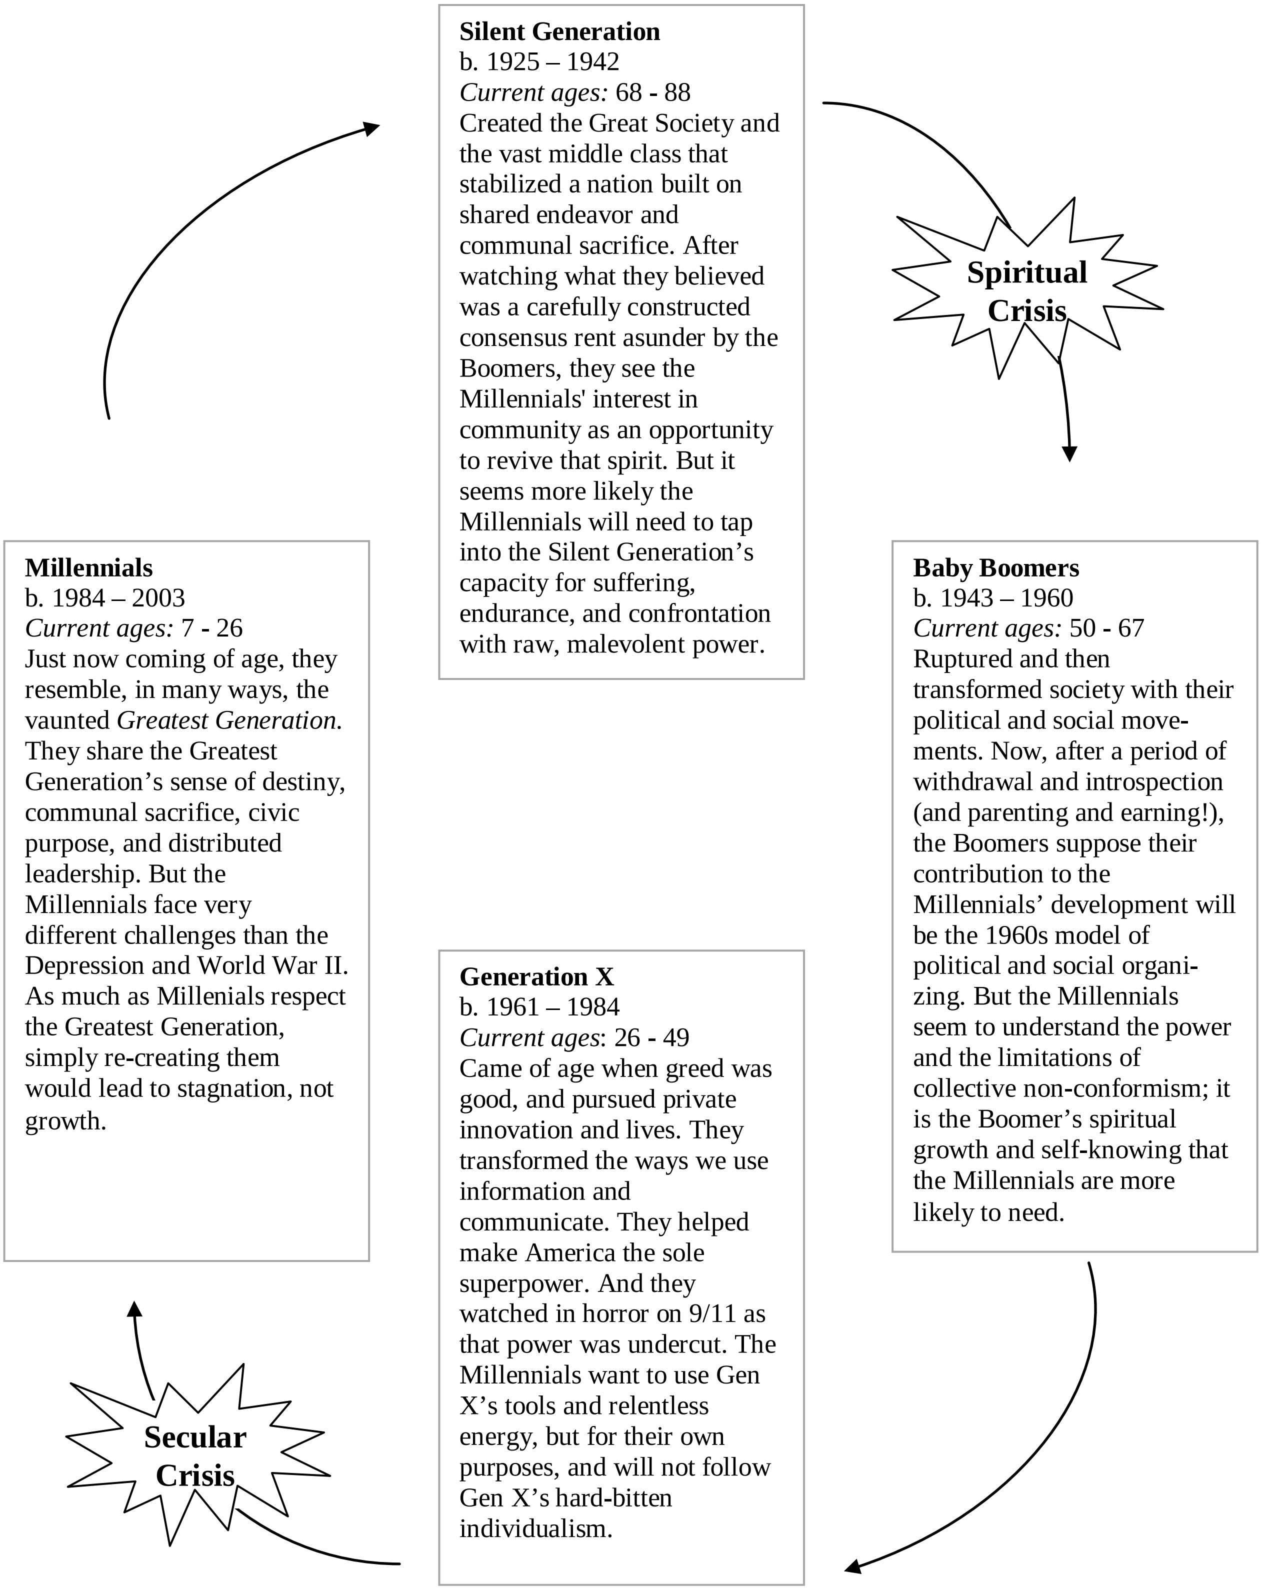
Either (or both) of these models might seem more “realistic” than a three-dimensional model that imagines political work shifting to a “higher key” in keeping with a higher level of complexity and challenge. But is it realistic to imagine that our political challenges can be solved, to paraphrase Einstein, from the same level of consciousness that created them?

Perhaps this is one of the reasons there are no young people in the room. With the heightened sensitivity and decreased habituation of youth, the Millennials may well sense the inadequacy of the political models proffered by their elders, even if they may not be able to articulate this directly. It could be that the rising generation’s experience of an ever-more complex world, demanding a “higher order” response, has attuned them to listen for a political melody in a “higher key.”

A column by Baby Boomer Thomas Friedman (2007, p. A23) epitomizes one of these generational disconnects. On a tour of colleges, Friedman found students “more optimistic and idealistic than they should be… [and] much less radical and politically engaged than they need to be.” After a few backhanded compliments about Millennial engagement with public service,

---

[10] The term “fixes” draws from Ron Heifetz’s (1994) distinction between technical challenges that require “fixes” (where “we” have the capacity to fix “it” without actually changing ourselves), and adaptive challenges (where “we” need to change ourselves, our perspective, our worldview, and our behaviors in order to have the capacity to meet the challenge).



Silent Generation
b. 1925 – 1942
Current ages: 68 - 88
Created the Great Society and the vast middle class that stabilized a nation built on shared endeavor and communal sacrifice. After watching what they believed was a carefully constructed consensus rent asunder by the Boomers, they see the Millennials' interest in community as an opportunity to revive that spirit. But it seems more likely the Millennials will need to tap into the Silent Generation's capacity for suffering, endurance, and confrontation with raw, malevolent power.

Baby Boomers
b. 1943 – 1960
Current ages: 50 - 67
Ruptured and then transformed society with their political and social movements. Now, after a period of withdrawal and introspection (and parenting and earning!), the Boomers suppose their contribution to the Millennials' development will be the 1960s model of political and social organizing. But the Millennials seem to understand the power and the limitations of collective non-conformism; it is the Boomer's spiritual growth and self-knowing that the Millennials are more likely to need.

Generation X
b. 1961 – 1984
Current ages: 26 - 49
Came of age when greed was good, and pursued private innovation and lives. They transformed the ways we use information and communicate. They helped make America the sole superpower. And they watched in horror on 9/11 as that power was undercut. The Millennials want to use Gen X's tools and relentless energy, but for their own purposes, and will not follow Gen X's hard-bitten individualism.

Millennials
b. 1984 – 2003
Current ages: 7 - 26
Just now coming of age, they resemble, in many ways, the vaunted *Greatest Generation.* They share the Greatest Generation's sense of destiny, communal sacrifice, civic purpose, and distributed leadership. But the Millennials face very different challenges than the Depression and World War II. As much as Millenials respect the Greatest Generation, simply re-creating them would lead to stagnation, not growth.

Figure 6. "Generational Tasks" to Support Millennial Transformational Leadership
(from the "Generations Salons" and other sources)

Friedman lowered the boom (pun intended)

> Martin Luther King and Bobby Kennedy didn't change the world by asking people to join their Facebook crusades or to download their platforms. Activism can only be uploaded, the old-fashioned way—by young voters speaking truth to power, face to face, in big numbers, on campuses or the Washington Mall. Virtual politics is just that—virtual. (Friedman, 2007, A23)

To which a Millennial might reasonably reply: "How do you know the world can't be changed through virtual activism? After all, no one has really even tried yet. And how's that whole "Fight the Power/March on the Capitol/Honk if You Oppose the War" thing working out for you guys? We respect your victories and your sacrifices, but the victories seem to get fewer and farther between, and toll more horrendous. Why are you so sure your way is the right or the only way?"

The Strauss and Howe model predicts that the current alignment of generational cohorts—if left unchanged—will contribute to the Millennials reverting to "saving the society" tasks reminiscent of the "Greatest Generation" (of course, events and circumstances may well dictate that these are exactly the kinds of tasks that need doing). Without a conscious effort, all of the generational cohorts will reinforce collectively the same patterns that have kept the US in its present cycle. For example, Baby Boomers—now peaking in terms of money, power, influence, and available time—carry a model of social change almost diametrically opposed to the emerging characteristics of the Millennials (see Figure 4 and the Friedman example above). The two cohorts agree only on an "active" orientation, but have been shaped by fundamentally different types of crises.

If the congenitally self-referential Boomers try to squeeze the Millennials into their model of political organizing, the outcome seems doomed from the start—virtually guaranteed to lead to a repetition of the "C-D-E-F-C-D-E-F" cycle. Gen Xers, raised to "just do it," probably will want no part of mediating any dispute between the Boomers and the Millennials, but instead seem more likely to return to their private pursuits than to take public action in a divisive environment. And many members of the Silent cohort, who share the Millennials' attraction to collective action, seem unlikely to engage with anything that risks a return to the scorched-earth "culture wars" of recent decades.

That's the bad news. The good news?

At our Salons, the Millennials appeared to grasp that they have method, motive, and opportunity to lead in a decidedly new direction. What they lacked, it seemed, was a coherent vision, based on an understanding of how the past created the challenges they face, as well as generational, developmental, organizational, and political models appropriate for the new work they envision. They also didn't often have the older generational cohorts engaging with them in ways that consciously supported their transformational potential. In our Generational Salons, the Millennials turned to the older cohorts and asked: "How can you help?"

Can Generational Cohorts Help Each Other…and Themselves?

In subsequent Salons, the generational experience has been raised time and again as a powerful reference point. Experiencing such stark differences among the generational cohorts confronted participants with the opportunity to uncover their unconscious mental models: the "right" way to take political action, theories of political change, even which political and non-political institutions most need "reforming."

The disparate perspectives that emerged from each of the generational cohorts seemed to jolt many participants out of their comfort zones. Instead of seeing younger or older versions of themselves among fellow activists, and wondering why people who seemed to share their political views did such puzzling things, they began to grasp that their fellow activists neither began with the same assumptions nor arrived at the same conclusions.

As progressive, politically active folk, many of the Salon participants are accustomed to exploring differences based on culture, class, gender, etc., and even in many instances, developmental perspectives. They willingly (some even eagerly) participate in "processing" sessions, and are comfortable with group dynamics and the like. After years of reflecting on the obvious divides (e.g., class, ethnicity) , many progressives seem almost comforted by exercises that cover this by-now familiar terrain.

The generational experience, in contrast, exposed a new realm of difference. However, we have yet to explore how to turn this observation into a more effective model of action. Perhaps this is a difference without a distinction. Perhaps we have accomplished nothing more than exposing a new vein of guilt-rich ore, which progressives can mine for solipsistic indulgence. Or, perhaps, the lessons of the Obama campaign (along with other models) offer a way of joining theory and reflection with action. And with that, perhaps, we can begin to find a way to rise out of the time-worn ruts that seem only to lead us back to where we began, neither appreciably wiser nor better off for the journey.

In every generation, it seems, self-appointed spokespeople try to convince their peers that a "defining moment" is at hand; that the future of (pick one or more: our party, our country, our world) depends on our urgent action. I'm no less prone to that; in fact, I'll go one better. We may well face a defining moment not only for our generation, but for all four generational cohorts alive in the US today (and those yet to come). It will take all of us—harmonizing and counterpointing, listening and rethinking—to support the Millennials in singing the familiar, sweet song of freedom in a new key. And so, again: "How can you help?"

Integral Politics as Process

Tom Atlee[1]

Abstract: Using the definition proposed here, integral politics can be a process of integrating diverse perspectives into wholesome guidance for a community or society. Characteristics that follow from this definition have ramifications for understanding what such political processes involve. Politics becomes integral as it transcends partisan battle and nurtures generative conversation toward the common good. Problems, conflicts and crises become opportunities for new (or renewed) social coherence. Conversational methodologies abound that can help citizen awareness temporarily expand during policy-making, thus helping raise society's *manifested* developmental stage. Convening archetypal stakeholders or randomly selected citizens in conversations designed to engage the broader public enhances democratic legitimacy. With minimal issue- and candidate-advocacy, integral political leaders would develop society's capacity to use integral conversational tools to improve its health, resilience, and collective intelligence. This both furthers and manifests evolution becoming conscious of itself.

Keywords: Collective intelligence, conversational methodologies, democratic legitimacy, developmental stage, evolution, integral politics, integration, perspectives, process.

Of the many perspectives on integral politics, one particularly dynamic one focuses on the interactive processes through which the fulfillment of collective needs and aspirations are (and could be better) pursued. These engage the evolving, integrated sensibilities, thoughts, and actions of a whole community or society. Those of us pursuing this approach ask: What is the social systemic process dimension of transpersonal activity and development? Where might a holistic, integral perspective take us beyond the predominant battle between competing worldviews, interests, and power centers within which humanity currently suffers and is possibly generating its demise? Developing political modes beyond the current problematic process could make all the difference in the world, quite literally.

---

[1] Tom Atlee is founder and research director for the Co-Intelligence Institute in Eugene, OR, co-founder of Evolutionary Life in Seattle, WA, and author of *The Tao of Democracy: How to use co-intelligence to create a world that works for all* and *Reflections on Evolutionary Activism: Essays, poems and prayers from an emerging field of sacred social change*. Once a peace activist inspired by Quakerism and Eastern spirituality, he now researches, writes, and networks about social issues, holistic and collective intelligence, wise democracy, conscious evolution and evolutionary change agentry. He works closely with "evolutionary evangelists" Michael Dowd and Connie Barlow and whole systems process consultant and author Peggy Holman. He is a member and former steering committee member of the National Coalition for Dialogue and Deliberation. His current interests include developing a theory and practice of "evolutionary integrity," defined as alignment with the fullness of reality and the possibilities therein -- and bringing greater process sophistication, wise-democratic understandings, and conscious-evolutionary perspectives to help empower already sophisticated transformational efforts such as the Transition Towns movement. SOME RIGHTS RESERVED

My discussion begins by introducing the dynamics of wholeness and their relation to what I propose integral politics may be. This serves as a foundation for proposing a definition of integral politics and characteristics of integral political process that follow from that definition. I dedicate the main body of the paper to introducing ramifications I draw from those characteristics. Discussed individually, the ramifications fall into seven categories: wholes and parts – diversity and coherence, dissonance, conversation, developmental stages, power and leadership, issues and candidates, and participation. These suggest some concrete ways we would see integral politics manifest. The concluding section is my reflection on all of this in relation to my ideas about conscious evolution.

Introductory Basics: Dynamics of Wholeness

We can view life as forever seeking wholeness, seeking health and congruence within itself, and seeking fit and harmony with its environment. I use wholeness as the most fundamental concept in my worldview, although my sense of it is not homogeneous but rather rich with diverse dimensions and manifestations (Atlee, n.d.-a).

Two dimensions of wholeness I see as having particular relevance to integral politics are inclusion and coherence. *Inclusion* means welcoming, taking seriously, and creatively utilizing all the factors relevant to the whole situation we are dealing with. Such factors include viewpoints, people, information, values, resources, history, and possibilities, and more could be listed. To acknowledge and tap the infinitude of interconnectedness in which we and our situation are embedded, we should frame relevance broadly enough to include borderline elements and even wildcards to stimulate lively engagement and keep us open and alert. In particular, inclusion of different *worldviews* is important because of their power to shape what people see, think, feel, and do, and thereby play a preeminent role in the productivity of political process. Furthermore, because worldviews impact the *kinds* of political system and process people prefer and promote, the principle of inclusion challenges us to wisely utilize a diversity of processes, as well.

Coherence means the way diverse elements hang together into a whole, whether a whole worldview, a whole community, a whole story, and so on. Coherence includes the relationships among the parts, as well as the factors they hold in common (like logic, culture, language, intention, theme, common interests). Thus, coherence includes everything that helps us make sense of a whole and all its elements as one thing, and for those involved to share a sense of "common sense."

We usually find some dynamic tension between coherence and inclusion. In any system or situation, including additional elements or a bigger field tends to disrupt whatever coherence existed before the inclusion. Likewise, efforts to maintain coherence tend to make it harder to include new (and thus potentially disruptive) elements. Since novelty and disturbances are continually emerging in any system, inclusion and coherence are perennial issues of life as it seeks to be whole within itself and with its environment. The fact that both inclusion and coherence are essential dimensions of wholeness tells us something very important about wholeness: it is dynamic. Wholeness *evolves*—driven by inclusion, disruption, and the eternal impulse towards coherence.

Here I find the concept of “integral” especially useful for naming the successful *integration* of inclusion and coherence. To the extent we embrace all the relevant elements—including emergent dissonances—in a coherent way, we have an integral system or dynamic. The fact that in real life new factors are always emerging to disrupt coherent systems suggests that an integral system evolves through successive coherences. The family system gets disrupted by the birth of a child. One’s prejudices are disrupted by a compassionate or unexpected act from a person in the disrespected category. One’s pet idea is critiqued with devastating effect. Each instance raises in us the need to find some new coherence to depend on.

With that as grounding, I propose a definition of integral politics, followed by what integral politics “does” if we follow that definition. I offer these for exploration, introducing my initial forays into ramifications of viewing integral politics this way.

Integral politics would be politics that were especially competent at including diverse elements in evolving coherence that served the ongoing vitality of a community, nation, or other human system.

What integral politics does:

- Integral politics embraces any and all interactive process through which the evolving diversity of a community or society engages in consciously co-creating its collective life.
- Integral politics emerges from other forms of politics to the extent that we attend to the dynamic relationship between “the parts” and “the whole” (the members of a community and the whole community; conflicted political positions and the whole field of opinion around an issue; our many facets as individual human beings and our essential wholeness; and so on).

Ramifications of Integral Politics Definition

Wholes and Parts - Diversity and Coherence

Assuming that definition, then, as politics became more integral, we might expect it to include more attitudes, efforts, and phenomena like the following (as they pertain to public affairs).

Welcoming people from diverse demographic, developmental, and other groups into appropriate forms of participation while promoting the respect and commonality of all people as human beings regardless of what category or categories we, they, or others may place them in.

Engaging diverse dimensions of our humanity (head, heart, body, spirit, behavior, etc.) and their related modes of understanding, expression and engagement, while *understanding* the various ways these can influence each other to enrich (or undermine) the larger wholeness of who we are, individually and collectively.

Engaging diverse sectors, stakeholders, and interest groups in aligning their self-interest to the well-being of the whole (community, society, natural order) by co-developing truly integral solutions, stories, social system designs, etc.

Including diverse partisan people in transpartisan or metapartisan explorations of how all of us as citizens of a common community or society can most creatively share challenges, resources, and destinies.

Weaving diverse perspectives, bodies of information, and values considerations regarding an issue or situation into expanded "big picture" understandings of what is involved (sometimes called "framing an issue for deliberation").

Helping people's diverse creative or practical insights, gifts, and passions interact towards solutions that are, as a result, (a) broadly understood and appreciated, (b) implemented in participatory ways and (c) effective over the long term (because of the inclusive wisdom of the original design), being revised as necessary through such continuing interactions.

Another application of wholeness is this. Integral politics understands that every whole is a part of some larger whole, and that every part is a whole in its own right. This understanding not only helps us see things in the context of the larger systems they are part of, and the smaller entities that make them up (a perspective known as *holonics*). There are also two *dynamic* aspects of wholeness that offer agents of integral politics potentially free resources.

Synergy is a common term highlighting the dynamic relationships through which a whole becomes greater, stronger, or more than the sum of its parts. Whenever we integrate youth and elderhood, head and heart, private and public, top-down and bottom-up, us and them, or any other such diverse energies or entities, they together form a whole that is far more powerful than when they are separate or opposed.

Holergy is a term I coined to call attention to the often invisible power of each entity's embedded uniqueness. That power becomes a resource to the extent we look beyond any single role they play or obvious categories they belong to. We might summarize this as "the part is greater than its role in the whole." Each person and group is both a whole in their own right and part of many other wholes. So a teacher who knows that her students are not *only* students will tap their experiences, hobbies, and families for resources to use in teaching her class. An integral mediator will recognize that conflicted parties are not only adversaries but are also sources of insight and creativity for resolving their shared problem. An integral politician will recognize that citizens are not only voters, supporters, complainers, and recipients of government services, but potential sources of wisdom, creativity, and implementation in public affairs.

Significantly, both of these phenomena—synergy and holergy—include the phrase "greater than" as part of their definition. This means that the entities and factors in a situation can generate greater or lesser power and benefit, depending on how we view and engage with them. This is useful knowledge for anyone seeking to create change with limited resources. Well-utilized diversity in well-designed whole systems can provide free resources "out of nowhere." The diversity of a community, well engaged, can generate collective healing, collective intelligence, and collective transformation accessible in no other way.

Dissonance

In public affairs it is normal for problems, issues, conflicts, differences, and other forms of dissonance to surface among those involved (among the parts) and between them and the larger community or society (between the parts and the whole). Integral political theory and practice would invite us to engage with this dissonance in different ways than those invoked and used in partisan politics. As we grow into integral politics, we would increasingly embrace the whole and all its parts in our calculus—and see the dynamics among them, including dissonance—as a sign and source of life energy, of life trying to find its way toward wholeness.

As politics becomes more integral, dissonance would less and less invoke assumptions about one “side”—one part of the whole—winning over the other “sides.” We would not even assume that the ideal is a compromise solution tolerable to all sides. Instead, we would see the supposed “sides” as partial expressions of a larger whole that has not yet been fully comprehended. We would, therefore, increasingly see dissonance as a resource for moving into a more vibrant wholeness of some kind. We may strive toward healing—renewing some healthy coherence of the past—or for learning, transformation, and development toward some new coherence of the future.

It would be increasingly natural for people practicing integral politics to see every issue or conflict as an opportunity not only to find good solutions, but to heal and/or transform the community involved, and all those in and around it. Often a community will actually heal itself by meeting crisis together using collective transformational engagement. The Transition Towns initiative (Hopkins, 2008), for example, is a remarkable program of community healing through collective transformation towards resilience and sustainability. Integral politics recognizes that working with emerging dissonances is a key aspect of sustaining ongoing health and development, individually and collectively.

This phenomenon can be taken as an identifying criteria for how integral our politics is: To what extent are issues, conflicts, crises, and so on seen as opportunities for healing and transformation at all levels, rather than as something to fight over, solve, suppress, or get beyond?

Of course “growing into integral politics” is no simple matter. But then, neither is playing the game of adversarial politics. The primary difference lies not in the effort or resources required, but in the unfamiliarity of the territory, the pioneering imperative, the need to try different responses to dissonant stimuli. Instead of closing down in the face of challenge or discomfort, we need to open up. Perhaps most importantly—because politics is not primarily an individual project—we need to take proactive initiatives, together, to create contexts in which welcoming dissonance and working creatively with it are supported and empowered. The more we can bring (and embed) such assumptions and practices into our culture, public discourse, and political institutions, the less we will need to depend on—and the more effectively we will benefit from—enlightened individual capacities.

Conversation

Conversation is arguably the primary form of human social interaction. (Some might argue that war and commerce are more influential, to which I would respond, Where would war and commerce be without conversation?) Obviously, because we are different and seriously challenged to cooperate in order to survive and thrive, conversation remains key to solving our problems and conflicts nonviolently and wisely as well as to transforming ourselves and our societies together in life-serving ways. Because of its remarkable power to creatively engage the life-energy of all participants, we find conversation plays a central role in most efforts to move beyond violence and manipulation.

Violence and manipulation help us dominate others with our own desires, visions, and perspectives, rather than engaging them in finding out what is best for all involved. In contrast, integral politics assumes that every perspective and passion has gifts for the whole, and so views the use of violence and manipulation as *wasting* those gifts and *wasting*, as well, the potentially coherent self-organizing life-energy of the whole that comes from creatively engaging those perspectives and passions.

From *a systems perspective*, conversational interactivity is the medium through which different parts of a system can find the coherence—coordination, protocols, and shared understandings, narratives, intentions, etc.—that they need to function efficiently as a whole. From *an individual perspective*, high quality conversation is a primary alternative to violence as we seek to pursue our self-interest in a world of other self-interested entities with limited perspectives.

Conversation derives from roots meaning “to turn together,” as in a dance. From a big-picture perspective, we are dancing with everything around us. The universe is in conversation with itself. At the most literal, physical level, few objects, systems, or conditions in our lives have come into being without being shaped one way or another by conversation. Conversation is how we can and do create desirable futures together.

Conversation is therefore central to any *dynamic* conception of integral politics. More model-driven conceptions of integral politics make a great contribution with political maps of how different political ideologies or developmental stages fit into larger political and developmental realities. When such maps inform the designers, conveners, facilitators, and participants of conversations, they move into a realm of dynamic interactions through which that diversity can actually be employed to create larger benign realities in our lives and help us all heal, learn, and evolve together.

High quality conversation is now a major field of theory and practice—and even faith. Going by such names as dialogue, deliberation, choice-creating, cafés, facilitation, gatherings, conferencing, forums, public participation, citizen engagement, hosting, mediation, coaching, community involvement, etc., conversational know-how has become very sophisticated in recent decades. Professionals in this field know a tremendous amount about “whole-system engagement,” “collective intelligence,” “participatory leadership,” “holistic politics,” and other topics of great interest to practitioners of integral politics.

Conversational methodologies abound, from Future Search to Open Space, from Dialogue Mapping to Sacred Circles, from Appreciative Inquiry to Listening Projects, from Dynamic Facilitation to World Café, from Citizens Juries to Study Circles, from The Integral Process for Complex Issues to Holistic Management. Inventories of such methodologies get compiled in both book form (Atlee, 2003; Holman, Cady, & Devane, 2007) and online databases like the Urban Research Program Toolbox (Griffith University, n.d.) and the Engagement Streams Framework (National Coalition for Dialogue and Deliberation, n.d.; in particular, note its "three page accompanying handout" for a list of processes).

Perhaps most importantly, work is underway in a number of quarters to identify conversational success criteria and wisdom about the underlying dynamics of conversations that matter. These inquiries free practitioners from the segregated silos of methodology into more flexible, creative design and hosting of powerful conversations.

I believe that knowledge and competency in this arena of the practice and institutionalization of powerful, empowered conversations is one of the primary foundations of integral politics. I see it as key to helping fragmented parts of the body politic become truly whole and sustain their evolving wholeness, especially when faced with changing circumstances or consciously moving in transformational directions.

Developmental Stages

Different developmental stages and worldviews offer different benefits and problems for a society that includes them all. For example, tribal dynamics provide both a strong sense of belonging *and* often provincial distrust and dislike of *others*, while modernist perspectives provide tremendous innovation *and* often destructive exploitation of natural and human life. To the extent possible, those practicing integral politics would endeavor to welcome and validate the positive manifestations of each stage while minimizing or ameliorating its more toxic dynamics (Beck & Cowan, 2005; Cook-Greuter, 2006).

People manifesting different developmental stages or worldviews often have a hard time relating to each other. Confronted with a logic and reactivity that makes no sense to them, they can drive each other into negative manifestations of their respective levels of awareness. Integral politics can use high quality conversational process and competent facilitation to ameliorate this dynamic. A large amount of experience with dialogue and deliberation that engages the broad public suggests that such diverse people have a far greater capacity to work together for the common good than is acknowledged among those with less experience with high-quality conversation or with an ideological bias towards the incompatibility of diverse values systems. There is tremendous hope in this.

There is also tremendous hope in another dynamic. One of the most intriguing phenomena I have seen in powerful conversations shows up in successful efforts that engage ordinary citizens constructively with others unlike themselves in a shared search for insights and solutions that can best serve their community. I have the distinct impression that as such conversations unfold, the effort to truly comprehend other viewpoints expands the individual participants' state of awareness such that they collectively manifest a higher level of awareness and development than they individually did at the start.

Other factors are probably involved in this phenomenon, for example:

1. Some conversational methodologies produce this effect more powerfully than others;
2. The presence of one or more psycho-spiritually mature, systemically aware, and/or broadly informed person in the group can raise the group's awareness toward theirs;
3. Potential repression or the positional stance, authoritative status, or expertise of certain group members can hinder this effect if not ameliorated by appropriate conversational design and competent facilitation.

In short, I believe that the conversational dynamic noted above—the expansion of awareness through successfully facilitated hearing of diverse viewpoints among ordinary people—happens to some extent in any case, and can be augmented by (1) and (2) and impeded by (3).

This phenomenon—*and* the capacity of people with different values and worldviews to develop policy recommendations together—can be the basis of testable hypotheses I would love to see researched in more rigorous ways.

If both these phenomena prove out and their nuances become adequately understood and applied, they may well offer a breakthrough channel for systems-change work by integral change agents. To the extent conversational forums are actually empowered to influence policy decisions and/or public awareness, plugging them into existing political-governance systems (Atlee, n.d.-b) could raise the developmental level manifested by society as a whole in its collective behaviors and impacts, beyond that of the vast majority of its individual members. This would remove, or at least ameliorate, the problems involved in the commonly advocated strategy of improving society's developmental state by increasing the awareness of its individual members.

Power and Leadership

If one of the chief characteristics of integral politics includes *the interactive process through which the evolving diversity of a community or society engages in consciously co-creating its collective life* (as introduced above) we need to rethink power and leadership from the top-down shaping of social phenomena to a more participatory, emergent, "power-with" worldview. What kind of power and leadership does a community or society need in order to engage its diversity in interactions that consciously co-create its collective life? I think this question leads to three related forms of servant leadership.

Capacity-building eldership that does whatever is needed—from inspiration to provocation to teaching to convening—to increase the capacity of the led community or society to lead itself. In the early stages, this can include whatever managerial guidance may serve to maintain the community or society while it achieves greater self-organizing competencies. But this more directive leadership can only work (for this purpose) if it is humble enough to keep trying to delegate more responsibility to the led system, and thus work itself out of a job.

Emergent participatory leadership, in which different people serve the group by (temporarily) leading in a realm defined by where their volunteered competencies and life-energy meet the needs of the group. This produces a fluidity and distribution of leadership functions among the group, according to the needs of the moment.

Embedded systemic leadership in which the guidance systems needed by the group to function and evolve are embedded in its culture, collective narratives, institutions, infrastructure, systems, and technologies. These ever-present sources of direction minimize the need for individual leadership to provide guidance—at least until the established guidance systems cease to function adequately.

At such junctures, when systems no longer function well, capacity-building eldership or emergent leadership shows up to bring group consciousness and co-creativity to the dysfunctional area. This is a sociological manifestation of the general rule that increased attentiveness is called for when automaticities—habits, institutions, reactions, etc.—are no longer serving well. Consciousness temporarily replaces the automaticities in making life's choices while also exploring the dysfunctional dynamics in order to create new automaticities that better serve the new circumstances. Putting newly functional automaticities in place then frees consciousness to attend to other things.

Issues and Candidates

Since the essence of integral politics, in the sense discussed here, is the capacity of a community or society to make its own high-quality decisions, integral political activism would not focus on issues and candidates to the extent traditional activism does. The one exception would be if decisions on this issue or the election of that candidate would make a significant contribution to the society's capacity to engage its diversity in consciously co-creating its collective life.

Integral political activists could also usefully focus on how issues and candidates in the public limelight were being dealt with by the existing political system, using them as stimulants for dialogue exploring more integral approaches that might better serve the whole society.

However, by its very nature, integral politics is not about taking sides or promoting particular solutions. So even if integral activists saw political solutions that could help us make more integral decisions, they might prefer to present them in a context where diverse citizens would consider alternatives in ways that furthered public understanding the issues involved. Integral approaches would not tend to push their favored solutions or candidates through to a win, no matter how "integral" those solutions and candidates might seem to be. This, itself, implies a radical shift in activist perspective to a deep trust in the collective wisdom of ordinary people in generative conversations.

Participation

When terms like "public participation" and "citizen engagement" are used in traditional forms of politics, they tend to refer to (a) interested people being able to have their say, thus exercising their agency as individual citizens in the political process and/or (b) as many people as possible engaging in political or community activities of all kinds.

Because of the dynamics discussed in the previous two sections, integral politics, in the sense being explored in this essay, would tend to function with a different concept of public participation. To a great extent, the goal would no longer be mass participation or the exercise of citizenship, per se. The rationale for engagement would be primarily the inclusion of diverse perspectives in processes capable of generating useful, integral results that benefit the community, usually involving collective intelligence or transformational potential.

Some participation issues are common to both traditional and integral politics. For example, participation plays a major role in generating shared understanding, agreement, ownership, and energy for implementation. But even here there are important nuances to consider.

Traditional political theory discusses the role of *consent* in establishing *legitimacy* in governance. A legitimate policy, leader, political process, or governing institution is one that has the consent of the citizenry. In other words, the population will go along with it without being compelled to do so. The concept of democratic legitimacy implies that those in authority need minimum force to implement their decisions, and that what force they do need to use is considered appropriate by a sufficient majority of the population. This minimization of force is often noted as the primary mark of democracy's superiority over dictatorship.

This is where participation comes in. If a large number of people or a broad spectrum of stakeholders and opinion leaders have been involved in making a decision, their sense of being part of the collective decision-making process tends to produce "buy-in" to the results. They consider the process legitimate. (The fact that participation and consent can be manipulated with PR and media mechanisms is a related but separate issue that I will not address here.)

Similarly, from an integral perspective, to the extent the population broadly understands why a particular approach to a public issue is better than others—particularly if they have either participated in or witnessed the interactions that came up with that approach, and have seen people like themselves powerfully involved—they will join in support for and implementation of that approach. The decision "makes sense" to them, so they willingly or eagerly engage with it.

But high quality deliberations that include vast numbers of people are notoriously expensive to implement. So one of the primary approaches of integral politics might logically be the efficient use of well-selected microcosm groups to come up with good decisions on behalf of the rest of us. High quality information and access to experts can be combined with high quality dialogue and deliberation in a highly focused way to generate powerful collective intelligence with minimal expense. This was one of the original rationales for representative governance. However, most representatives are not anything like the rest of us (e.g., millionaire lawyers), and we've all watched how far they can be pulled from public realities and pursuit of the common good.

So other forms of microcosm conversation have been developed that are less subject to the distortions of representative democracy, more reflective of the population, and often more capable of high quality decisions, which can serve to improve the performance of existing governmental structures and processes. For example, citizen deliberative councils use a randomly selected one-time group of 10-100 ordinary citizens to come up with solutions to a public issue and/or to evaluate existing proposals or candidates. (Atlee, n.d.-b) The fact that these councils are small and may not include a certain level of diversity may subject them to “legitimacy” challenges.

However, there are ways to generate a more integral (and deeper) form of inclusion and legitimacy than can be achieved even by mass participation. Convenors can consciously select participants and publicize the process in such a way that most citizens see people like themselves engaged on the council (for example, see the *Macleans* magazine People’s Verdict project, Doyle, 1991). Participation can be further promoted by engaging the public in conversations with the council and/or each other before, during, and/or after the council’s deliberations. Engagement with the council can be done through hearings and white paper submissions, as was done with British Columbia’s Citizens’ Assembly on Electoral Reform (Citizens’ Assembly, 2004) or on the web, or through TV or radio combined with call-in and “televote” phone numbers. All these engage the public without having to provide them all with the expensive conditions that enable the high-quality council process, nor (for the sake of economy or co-optation) engaging everyone in low-quality conversations that do not adequately serve the common good. This kind of engagement—synergy between a citizen deliberative council and the broad public—takes participatory democracy beyond consent into the realm of collective identification with the process, authentic co-creativity, and co-evolution.

Conscious Evolution

I do see a larger story being played out here than one of mere politics, or even of democracy. It is the story of conscious evolution. We are all participants in life and society, no matter what we do or don’t do, whether we are aware of it or not, whether we intend to be or not. Participation is intrinsic. Both action and not-doing are actual contributions to what happens next, for better and/or worse. We are all part of the evolutionary process, which unfolds with inexorable inclusivity.

Conscious evolution means becoming an aware, intentional participant in that evolutionary process. Conscious evolution means seeking to be aware of what is involved in that process in specific domains and situations and seeking to be aware, too, of who we are and who we might be in relation to that. It involves making choices and taking action—or not—with as much awareness as we can of our evolutionary role as we seek to serve and manifest the best of what life is and seeks to be. Conscious evolution means not only being a conscious agent of evolution. It means realizing we are living manifestations of that aspect of evolution that is becoming conscious of itself.

I see integral politics as a societal manifestation of conscious evolution. It is the means by which a community or society consciously co-creates its next evolutionary development. In the development of integral politics, we see living political systems waking up, becoming conscious agents of their own evolution and, therefore, manifestations of evolution becoming conscious of itself in and as social systems.

This perspective does not necessarily provide how-to guidance to agents of integral politics, unless, of course, we wish to study the known dynamics of evolution in cosmic, geological, biological, and cultural systems in search of patterns we might use in consciously evolving our political and economic systems, communities, and societies. However, this evolutionary perspective *does* give a greater meaning and cosmic significance to what we are doing when we work towards creating a more integral politics.

From the evolutionary perspective, what we are doing here is the next chapter in a remarkable—and many of us would say sacred (e.g., Dowd, 2007)—story that goes back at least 13.7 billion years. It is a very fresh chapter. This particular task has not been done before. We are the edge of a wave, developing modes of being together that will play a profound role in the evolutionary destiny of the human experiment. There's nothing small about what we are doing.

And it is not only about process, it is *in* process. And, ultimately—like, and as, evolution—it *is* process.

Introduction to Interviews that Apply Integral Lenses to Sustainability and Politics

Russ Volckmann

One of the apparent implications of our growing connectedness and concern for global challenges—economic, political, social, ecological, spiritual and more—is that there seems to be a parallel development of attention to ways we have of thinking about these challenges. To stretch this notion a bit more, we are looking for ways that we can engage as complete beings in addressing the challenges that face all aspects of our places in communities, nations, and the world and as individuals threatened with possible survivability challenges, as well as opportunities to realize our potentials in ways we may have never considered before. It seems quite natural that we would turn to systems theory and quantum/complexity theories in the material realm in that they seem to offer approaches to assist us. It seems just as natural that we begin to engage with the non-material aspects of existence, as well.

One of the newer institutions for sharing innovative efforts around the world is the TED conference. Originally, all of these conferences were held in Monterey, California in the United States. Here is their description

> TED is a small nonprofit devoted to Ideas Worth Spreading. It started out (in 1984) as a conference bringing together people from three worlds: *Technology, Entertainment, Design.* Since then its scope has become ever broader. Along with the annual TED Conference in Long Beach, California, and the TEDGlobal conference in Oxford UK, TED includes the award-winning TEDTalks video site, the Open Translation Program, the new TEDx community program, this year's TEDIndia Conference and the annual TED Prize. (http://www.ted.com/pages/view/id/5)

Since then the conferences have spread around the world, most of them being referred to as TEDx conferences. What is useful to those of us not able to attend is that presentations are recorded on video and posted on their website. The result is a host of inspiring, challenging, innovative presentations in many fields.

In a recent TED presentation Stewart Brand—a man who has been involved in addressing whole earth challenges for decades—presents four environmental heresies.

1. The growth of cities is good for the environment. It relieves the destruction of subsistence farming and engages individuals who move from the countryside into the city in entrepreneurial processes that support their economic development (which promotes educational development, etc.). What is needed is support these activities through such things as provision of energy and crime prevention.
2. Further develop nuclear power. It is the cleanest energy technology we have.
3. Develop even more genetic engineering for crops. It allows for increased food yields to meet the needs of a growing population.

SOME RIGHTS RESERVED

4. Use more geoengineeing to control the earth’s climate.

His brief presentation following TED guidelines does not address some downsides of his proposals, such as the estimate that we will run out of fissionable materials for nuclear energy in just a few short decades or the history of humans’ engineering endeavors. By the latter I mean that the negative impact of engineering strategies can often be devastating on the ecology. A simple example is the construction of dams to control flooding and that have destroyed habitats of people, fish, and animal life. Similarly, there are concerns among the scientific community that geoengineering has control and predictability problems, with potential unintended consequences. From a political point of view, sophisticated systems of geoengineering could be used as weapons in our hugely at risk humanization (meant pejoratively) of the technology.

Brand’s heresies are one set of many energies being directed at addressing assumptions and challenges we face in the world today. These are technical challenges, as well as social challenges. These are challenges to our life conditions and worldviews and our connection to the universe. If we are going to be capable of more sophisticated, holistic and generative approaches for addressing these challenges it is essential that we increase our understanding of the implications and ramifications of the choices we make to intervene in the ecology of the world. Our inattention has contributed to the state of the world’s ecology today in which our choices may lead to the premature demise of our children and their children. Therefore, we need to develop our capacities to intervene that are not only driven by current and anticipated realities, as we understand them, but also leverage the best tools we have for our efforts. Challenging assumptions, as Brand does, is part of that. And we have inklings of the power of new ways of being, seeing and doing the world and ourselves that can help us evolve that sophistication. Transdisciplinary, integral and other developmental approaches offer us some of this potential. Systems theory has a contribution, as does design thinking.

Fred Collopy, Professor and Chair, Information Systems Department, Weatherhead School of Management, Case Western Reserve University, Cleveland, Ohio points out in a *Fast Company* blog that design thinking needs to be introduced in a way that it does not take on so much baggage as to make it of marginal utility by leaders and managers of our institutions.

Note that design thinking goes beyond product design. Michael Ben-Eli (more about him in a moment) notes that Buckminster Fuller used the term “design” to imply a number of distinctive qualities:

- A sense of an underlying order,
- A “whole,” marked by coherence, and
- The implied presence of a deliberate intelligence.

This way of thinking about design goes beyond the material into the realms of cognition and the senses. Its implications, according to Ben-Eli are

- Design can involve an active initiative, the shaping of a particular configuration (a particular part of reality),

- It can relate to a subjective experience as when we recognize order in an observed phenomena, and
- It can entail concepts as well as physical entities and combinations of both.

Further, "This value driven, ethical aspect is derived from a hierarchy of three concepts that are central to Fuller's design philosophy. They include:

- Acknowledgement of the mystery and inevitability of an implicated higher order,
- A particular definition of Universe, and
- A specific view concerning the function of humans in the cosmic scheme of things.

Ben-Eli's presentation flows from here into a parallel discussion of design thinking that emerges from design as a process of realizing intentions. "Design is fundamentally an integrative process involving the synthesis of elements into a coherent whole. Synthesis is paramount. It involves the intuitive ability to see the possibilities of novel combinations." Here we see the principle in action underlying out interest is systems and design thinking, integral theories and transdisciplinarity. Ben-Eli also has outlined a clear relationship between design as a process and an intention. His PowerPoint presentation on this is available at http://www.sustainabilitylabs.org/page/design-science-framework-change.

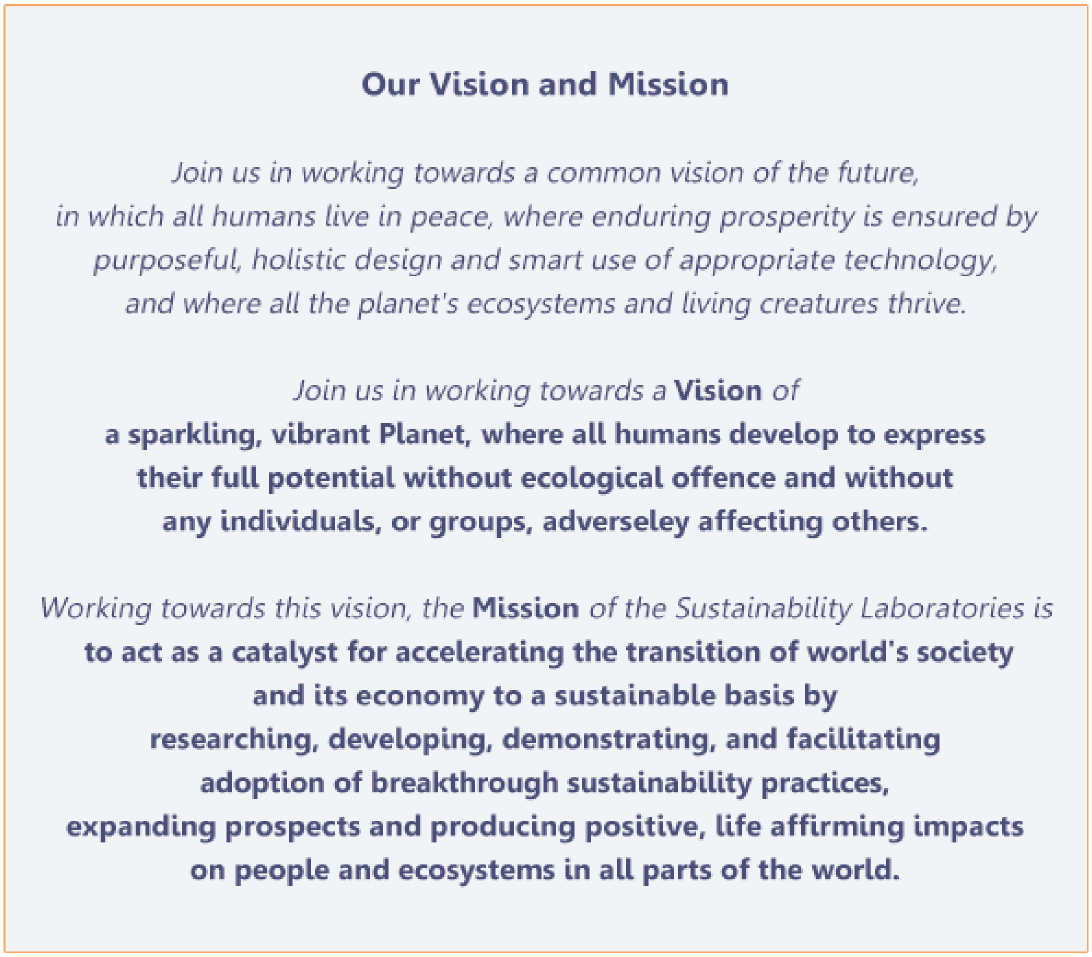
Embracing these approaches also leads us to examine our assumptions, many of which stem from values, worldviews, ideologies and—some would maintain—neurology and biology. Brand models this, as must we.

In the pair of interviews to follow I present individuals who have two very different and, I would suggest, complementary approaches to addressing the politics of ecological and developmental challenges. Yet, even from their divergent paths they have reached some very similar conclusions and intentions, as you will see.

Jan Inglis focuses primarily on local communities and the use of an intervention designed, tested and implemented in the US and in Sweden by Sara Nora Ross and others. She describes how this process (TIP: The Integral Process for Working on Complex Issues) works (see here for a workshop overview or here for articles). Fundamentally, hers is a think globally, act locally strategy.

Inglis' work has been primarily with individuals and communities, particularly from her small community base in British Columbia, Canada. She is focused on how change occurs and how individuals evolve into healthier ways of being. Thus, her attention has been on individual and cultural change. Her interests have led her into peace movements over the years, as well as engagement in local community politics. She has engaged in bringing many different fields of study and action to inform one another and find ways of creating an integrative approach to social change. She founded the Integrative Learning Institute and its curriculum for social change agents, the Cultural Coaches Training Program.

Michael Ben-Eli brings many years of experience based, in part, on his association with Buckminster Fuller, his training as an architect in the United Kingdom, and his work all over the globe on behalf of bringing his design perspective to engagement with change and development capabilities. While he eschews politics, there is great political relevance in his work. He has founded the Sustainability Laboratories that includes this vision.



Our Vision and Mission

Join us in working towards a common vision of the future,
in which all humans live in peace, where enduring prosperity is ensured by
purposeful, holistic design and smart use of appropriate technology,
and where all the planet's ecosystems and living creatures thrive.

Join us in working towards a **Vision** *of*
a sparkling, vibrant Planet, where all humans develop to express
their full potential without ecological offence and without
any individuals, or groups, adverseley affecting others.

Working towards this vision, the **Mission** *of the Sustainability Laboratories is*
to act as a catalyst for accelerating the transition of world's society
and its economy to a sustainable basis by
researching, developing, demonstrating, and facilitating
adoption of breakthrough sustainability practices,
expanding prospects and producing positive, life affirming impacts
on people and ecosystems in all parts of the world.

As I read this, nothing could be more political in its implications. But his message seems to be that the path to sustainability will be served best by focusing on the practices and activities that support sustainability through both technological and cultural design. In his sustainability principles he extends our attention from the technical and the cultural into the realm of the spiritual (a treatment of these may be found here).

Taken together, we find the elements of an integral perspective on sustainability and change. We see in the lives and work of these individuals the integration of the domains of attention required for generative development. And we are challenged to consider how we engage with "politics" to move forward. The world of action represented by these individuals is not just action in the realms of individual, community and cultural development designed to address ecological survival and sustainability. Theirs are political acts often taken outside the realm of formal politics.

In economics we speak of the formal and informal economies. The latter are those aspects of economies that are difficult to identify and account for through financial and government bookkeeping and taxing activities. Just as there are hidden populations in census surveys there are hidden economies and hidden political dynamics. To address the world of integral politics we can look through at least two lenses, which can be expanded through a metatheoretical approach into many more lenses.[1] The first is integral as it represents a "theory of everything," that is, it can produce models and maps in which we can integrate widely diverse ways of knowing and researching political dynamics and systems on the individual and collective levels, include "meta-collectives" which move our attention from community and nation to the global perspective of politics. It can include lenses related to governance, agency and communion and many others. The point is that to gain an integral perspective involves the application of transdisciplinary approaches through the use of multiple lenses.

A second is to understand politics from a stage of development perspective. Here we would consider what politics might look like in a social stage where the focus in on family and tribes, as well as other stages of phases of human and cultural development in which politics is played out through institutions to enforce rules and correct behavior, to one that seeks to integrate diversity through transcending and including all those individuals and cultures at various stages of development. In these interviews we can glimpse both these perspectives, albeit they have not been made explicit. I trust that these interviews are in service of our development and learning in this process.

Design and Sustainability:
An Interview with Michael Ben-Eli

Russ Volckmann

Russ: *Welcome Michael Ben-Eli, it's a wonderful opportunity to speak with you. I'm hoping that we can explore some really interesting areas, and given your background, I doubt that will be a problem.*

To begin with, I want to talk about your background in design. Is it primarily in architectural design? And how has that been a part of your life?

Michael: I've been fascinated since childhood with buildings. I went to study architecture and urban planning at the Architectural Association in London during the sixties, at that time, a preeminent place in the world. It was a very avant-garde and progressive school. A lot of really fascinating people were there focusing on all questions of urban planning, buildings and everything that revolves around architecture.

Russ: *When you talk about addressing all the problems and challenges of city planning and architecture, are you speaking of that with essentially an engineering perspective on design? One that is primarily concerned with the technology—is that what you meant?*

Michael: If you look in retrospect there were two different main areas of emphasis. One was technology, more technology in general than engineering. In England especially, there were futuristic groups trying to translate into architectural visions possibilities that were opened up by the world of technology. The new technology of space exploration, for example, had a huge influence on what could be done with building design both in terms of visual impacts and actual structural possibilities. Designers were grasping for the outer reaches of technology—how those would impact both on urban planning and individual structures. The latter were increasingly conceived as large mega-structures made possible by new materials and other technologies.

At the same time, there was a growing emphasis among urban planners on social issues as an integral part of physical planning. There was the realization that there were a lot of important "soft" questions and socio-economic forces at play shaping urban environments, all of which had to be understood and taken into account in effective design. Such issues would relate, for example, to different income groups, different needs and functions, and the integration of people, spaces and functions in a comprehensive design. England, at the time, was very advanced in those ideas. A great deal of pioneering work was done on these issues starting from the years immediately after the war—I'm not quite sure who's in the lead today in that field, but at that time, many of the show-case model projects, were developed in the UK.

Russ: *You're speaking of model projects both of city planning as well as building design?*

SOME RIGHTS RESERVED

Michael: Yes. This is probably because when you look at the urban field, some of the best English architects and planners were actually employed by local authorities. At the time, the Greater London Council and some other organizations like it were in charge of urban planning addressing large scale issues of transportation, new housing projects and the like. They were all public sector entities. They were not private offices. Some of the best people in England were employed by those organizations that provided unique opportunities for real creativity, quite an unusual thing for government organizations.

Russ: What opportunities did it create for you?

Michael: I was a student at the time, so I was not participating in actually solving real problems, but London at the time—and the AA in particular—was a hotbed for new ideas. The AA was basically a club. It was a school that was operated by the British Architectural Association. At the heart of the school were a restaurant and a bar. Many of the architectural offices tended to aggregate in that area, near the British Museum. Architects and planners from those offices would all come to the AA twice a day—first for lunch, and then for drinks after work—and these were the moments where a lot was happening in terms of open discussions, brainstorming and plain networking. There was a lot of excitement. It also meant that anyone who was anyone in the architectural world who was passing through London would somehow end up at the AA. These visitors would have an opportunity to lecture and chat informally with the students. It was a unique and creative environment—that's where I met Fuller and some other leaders in the field.

Russ: You met Buckminster Fuller there. Can you tell us about that?

Michael: In the mid-sixties, Fuller was advocating an incredible program. In retrospect, it was one of those typical Fuller ideas—naïve and completely impossible, but absolutely correct. It was a program he called the World Design Science Decade: Ten Years of Design initiative, where all the architectural schools in the world would collaborate in a ten-year program that would focus, in five two-year increments on redesigning the world— dealing with issues of human trends and needs, energy, natural resources management, pollution, the environment, the whole industrial infrastructure—all the issues that have now become so pressing from the viewpoint of sustainability.

Fuller gave a lecture in London about the program and I had never heard anything quite like it. I was completely awe struck and fascinated by his vision, so along with some others at the AA, I joined in the program and started working on it. Much of my subsequent time at the AA was dedicated to this effort. I was also involved with a lot of experiments in designing geodesic domes and various space structures, trying different materials—anything from bamboo to aluminum, corrugated cardboard and Ferro-cement, things of this nature.

Russ: Is there any one project or effort that is memorable to you?

Michael: One very unusual project comes to mind that requires a bit of an introduction. The British educational authorities—the bodies that are in charge of granting degrees and so on—were actually in charge of University education in Ghana, a former British colony.

In particular, the Royal Institute of British Architects was in charge of supervising degree granting at an architectural school that was established in Kumasi at what was at the time known as the Kwame Nkrumah University of Science and Technology. John Lloyd who was a Year Master at the AA was asked to take over that school and run it. He was a big Fuller fan, so his idea was to go to Ghana and reorient the school—develop a new curriculum that would reflect a lot of Fuller's design philosophy, including a focus on the World Design Science Decade program. Although I was only a second-year student, he invited me to come to Ghana—I was quite close with Fuller by that time—along with Keith Critchlow, who was teaching at the AA, to work with him and Fuller on redesign of the curriculum of the school.

So we went to Africa for a year and worked on trying to reorient that school and focusing its approach around Fuller's ideas. That was also a time during which Keith Critchlow and I had a great opportunity to do a lot of research in Fuller geometry and tried different types of structures. We did some very nice aluminum and bamboo geodesic domes in Africa. We were experimenting with a lot of local materials. Aluminum was one of them, because Ghana had a great deal of bauxite sources. So, we tried to use aluminum as one possible building material. These were basically experiments with geodesic structures. Of course, Keith went on to become a preeminent authority on geometry and architecture and his work was very much influenced by Bucky's synergetic geometry.

Much of the rest of the years at the AA involved the sort of normal design project that you get in school, but also a great deal of work on designing some of the events that related to the World Design Science Decade program as advocated by Fuller.

Russ: *Were you involved with Buckminster Fuller in other ways?*

Michael: The school actually allowed me out of regular schoolwork in order to have this basically "apprentice" opportunity with Fuller. Hence, it was possible to spend the year in Africa and otherwise focus on the work of the World Design Science Decade for the five years that I was at the AA. The basic understanding was that I would also do all the other stuff that my peers had to do, like exams and projects. I lived a double life in a way, but it was fascinating and very energizing.

Russ: *It sounds really exciting. Where did it take you from there?*

Michael: Oddly enough it took me away from architecture. I graduated from the AA, but largely because of Fuller's influence I realized I would not end up in architectural design. I became fascinated with the issues that were raised by his vision concerning the management of world resources and the environment. I started to move in that direction and look for additional tools that would make me more effective in dealing with those questions.

I felt at the time that the emerging fields of General System Theory and Cybernetics offered such new ways of thinking, a new conceptual framework, a new language, essentially—new in the sense of creating new tools for dealing with complexity and understanding the nature of complex systems, how complex systems regulate themselves, how they change, adapt and evolve. So when I graduated, Fuller invited me to join his staff here in the United States. While working with him on some projects, including a very interesting project with members of some street gangs in New York, I started commuting back to London to work on a Doctorate in Cybernetics with Gordon Pask. That took me to a more abstract notion that is interesting as it relates to your question about design. I started dealing with a more abstract form of design—the design of organizations and the "architecture" of institutions, organizations and management processes.

Russ: *So your attention expanded from the physical design dimension to human system design?*

Michael: Yes, completely correct.

Russ: *How did you proceed with that in your career?*

Michael: In 1973 when I left Fuller's entourage, I got married and was offered a project to work on in another country. So I left the United States for a while. I was just finishing my Ph.D. then and I basically set myself up as a management consultant. I was very lucky from the outset in that I received some very challenging and large projects that allowed me to experiment with all these ideas—both the fundamental intention that is imminent in Fuller's philosophy and his design approach, but also experimenting with all the ideas from general systems and cybernetics. I was increasingly focusing on the ways large systems function and on their essential architecture.

Russ: *What might be an example of one of those types of projects?*

Michael: For example, in the early years I did a lot of very large strategic planning projects in health care in some of the key academic medical centers in and around New York. All of these involved designing the process of planning, itself. This is something that is rarely done deliberately, as it should. People jump into planning activities without understanding that the planning process itself requires an entire infrastructure of its own in order to succeed. Some of those projects also included major reorganization efforts, which meant having to deal with the architecture of those institutions. The design of their internal structure needed to be addressed and there were fascinating issues involved. Remember, the typical medical center comprises a number of very different functions under one roof. It has a hospital, for example, something that people can look at from a more conventional business point of view, more like an industrial operation, where you can measure things like patients per day, length of stay, level and intensity of care, and the like. Then, you've got the medical school, basically a university with all the teaching and pure research components. These are three functions—patient care, teaching and research—which require different management approaches, yet need to be integrated in one whole system. This makes these organizations especially interesting —more complex than the typical business enterprise of a similar size. They were very interesting times as I attempted to get my feet wet in institutional design in those environments.\

I expanded from there into other arenas until 10-15 years later I was called into projects that were dealing more with regional management and planning issues. For example, in the Great Lakes area there was a planning project that brought many of the issues raised by Fuller, issues of environment, resources, technology, economy, society and so on, in one effort. In all of these kind of projects, I think my contribution was to bring the system perspective, both in the design of the approach to a problem as well as in actually carrying it out.

Russ: *Are there some key principles around the design of the approach that you could identify?*

Michael: There are a few that come to mind. One is the systems approach, which means a comprehensive view of problems that takes into consideration a larger domain of concern. It tries to understand what are the key elements, the key variables, in that domain, how they interact and what are the consequences of those interactions. Taking a system view to what are essentially systems is essential—we normally deal with complexity by trying to simplify it often to the point of trivialization. We take a typical system issue and we trivialize it by trying to make it as simple as possible by reducing it to handle-able components. By the time we do that we tend to loose the whole system essence, ending up treating a complex system as though it was a simple clockwork mechanism. We then are surprised that many of the results of such an approach don't work well. So, one important thing is the comprehensive system approach.

Another important aspect is one that has been given different names. Its significance was emphasized by Fuller, but by other thinkers as well, notably by Russ Ackoff, for example. He called it "Ideal Design." Fuller referred to it as "preferred states," that is, the requirement not to focus on the limitation of a problem, but rather to project yourself to the ideal situation that you wish to achieve and then work backwards to achieve it.

Russ: *Can you give an example of how that works?*

Michael: One example would be how you deal with the energy issue. You could approach it by saying, "We are burning fossil fuels. This is creating greenhouse gases in the atmosphere that have impact on climate change. How to solve it?" You proceed to focus on the solution on how to ameliorate what is going on now. Then you can come up with all kinds of arguments about whether to reduce emissions by 5% or other solutions, short term, limited solutions that are typical to the way the international community has been trying to deal with the problem. Or, conversely, you can take a completely different approach and say, "What we need here is a global planetary energy independence, which means graduating to a source of energy that is non-depletable, must have zero harmful emissions and be available to all." Then the problem you have to solve is of a completely different nature. Do you see the difference?

Russ: *In the latter, you're starting with your goal or vision. Then you look at the activities that would be required to create that.*

Michael: Exactly! There's a big difference if you start with an aspiration, something you would like to achieve, even if for the moment you don't even know how, as distinct from starting with a current "problem." You can fix the faucet, but you'll still have the same water supply, whereas if you take that problem instance as an opportunity to consider what the best thing would be for everyone, it's a completely different question.

So that is the system approach and ideal design. It's so important, because it is essential to addressing the challenge that humanity faces on the planet today. You can talk about how to eliminate poverty or hunger or how to create a future where all of humanity can live and experience different degrees of wellbeing altogether, and then determine what will be necessary for that. Then you can talk about what we need: clean renewable sources of energy, clean, reliable, water supply, all these things in a qualitative sense, first. Then you go on to explore what would be required in order to achieve that, including the technology, institutional redesign and removing of the obstacles that are in the way. If you start with the problem, you'll never get there.

Russ: *As I listen to you, your passion for addressing the issues of sustainability is palpable. I'm aware that is an arena where you have been investing a great deal of your energy.*

Michael: It started, with Fuller's inspiration, to understand that those issues exist. I never had any sense of those issues when I started school. I was thinking about architecture like Frank Lloyd Wright—building and so on. Fuller opened my eyes to a completely different way of looking at the world and the kinds of issues that are important. Over the years, I think that I've tried to intuitively assemble the experiences and the tools that will make one more effective in understanding and dealing with those issues. For a few years now, I have been feeling increasingly confident that I completed my basic training. That I graduated from my own university, if you will, and that I am ready to focus on these issues trying to affect real change. That's where the idea first came to develop the Sustainability Principles and to launch the Sustainability Laboratory.

Russ: *I'm aware that you've spoken about sustainability principles. The last I've heard there are five of those. Is that correct?*

Michael: Yes. The origin of that is when I began to play with the idea of establishing the Sustainability Laboratory. I was wondering what would make it different than many other centers or institutes for sustainability that currently exist. One thing that I thought was missing was a set of coherent principles that define the true meaning of sustainability, as a state. What are the absolutely essential elements, the minimum statements that you can make regarding sustainability, the required conditions without which it can't be fulfilled no matter how you play with words. If you want to construct a vehicle so you can fly, you had first better understand the principles of aerodynamics. Similarly, if we are serious about implementing the state of sustainability as the universal planetary state, what are the underlying principles that need to be upheld?

I pondered that for a long time and I spent about two years drafting my ideas. I was very unsatisfied with the currently prevailing definition of sustainability, basically the one that was offered by United Nations' report associated with the Bruntland Commission, a definition that is accepted by most. So, I tried to give the concept a more precise definition and then derive the principles from that.

Sustainability:

A dynamic equilibrium in the processes of interaction between a population and the carrying capacity of an environment such, that the population develops to express its full potential without producing irreversible adverse effects on the carrying capacity of the environment upon which it depends.

Sustainability Principles

The First Principle:
Contain entropy and ensure that the flow of resources, through and within the economy, is as nearly non-declining as is permitted by physical laws.

The Second Principle:
Adopt an appropriate accounting system, fully aligned with the planet's ecological processes and reflecting true, comprehensive biospheric pricing to guide the economy.

The Third Principle:
Ensure that the essential diversity of all forms of life in the Biosphere is maintained.

The Fourth Principle:
Maximize degrees of freedom and potential self-realization of all humans without any individual or group, adversely affecting others.

The Fifth Principle:
Recognize the seamless, dynamic continuum
Of mystery, wisdom, love, energy, and matter
That links the outer reaches of the cosmos
With our solar system, our planet and its biosphere
Including all humans, with our internal metabolic systems
And their externalized technology extensions --
Embody this recognition in a universal ethics
For guiding human actions

The five principles pertain to the five different levels or domains, almost like chakras, that are important to pay attention to. On one extreme you have the physical domain that deals with issues of energy and matter, all the "stuff." The second principle deals with the economic domain in the sense of the meaning and creation of wealth. The third domain deals with the principle of life. We are part of a larger, living fabric called the Biosphere and we have to behave as good neighbors to other species. The fourth is the social domain that deals with the guidelines for social behavior. The fifth, which is probably the most critical, is the spiritual domain that really provides the value orientation to everything else that you're doing.

It's interesting—in the beginning I only had the first four domains and I felt that something was missing. I was beginning to play with the value or spiritual dimension. Many people that I talked to in trying out those ideas were discouraging this. "If you want leaders in government and business to take you seriously," they would say, "you cannot talk about spirituality." It didn't take long for me to realize that without the spiritual domain the others are just techniques. It is really the spiritual orientation, the underlying value held, which coheres and ties everything together. It serves as a center of gravity for the other four domains, for all of the rest.

That's how those five principles developed and began to spread on the Internet and so forth. Certainly they've been the guiding principles for the work I do and for much of what the Lab is and will be doing. The important thing about those five principles is that they are not single separate things. The five constitute the dimensions of one coherent system. What we tend to do many times is try and focus on problems in one area, not the others. Some people think we need to solve some technology problems and everything will be all right, but if we have a predatory orientation toward the world, that's how you will use your technology. Going to the other extreme, some believe we need everyone to become spiritual and sit and meditate. That, of course, will not take you too far if you don't also have the physical infrastructure to sustain the 9 billion people we are soon to have on the planet. You really need all five principles to cohere and create one system, and that's the biggest challenge of the sustainability transformation. You cannot deal with it in pieces—you have to deal with it as one whole system that is manifested in those five dimensions.

Russ: *In recent months, I've been feeling a little dissatisfied with the concept of sustainability and have been playing around with the notion of "thriving" as opposed to sustainability, because it suggests something more of the evolutionary potential that may be involved here.*

Michael: I also have been very unhappy with the term, especially because it's been so misused that it's almost lost its meaning. I haven't found a better term, so what I did instead is adopt that term but give it my own definition.

Russ: *How are you working in the world around the extension of these sustainability principles?*

Michael: At the moment, I'm working essentially on two levels. One is educational where I do quite a bit of speaking to all kind of audiences. I try to spend as much time as I can with young audiences—university students in different countries mostly. On another level I try to do actual projects. Currently, I am working on a fascinating project in the Negev Desert, in Israel, with a group of local Bedouins. We are creating an actual model of a sustainable desert community, which will be based on the Bedouin tradition and expertise with desert agriculture, but leveraged with the most advanced technology in solar energy, water treatments, silvipasture, and the like. At the end, we'll have an integrated desert, organic farming operation with livestock, medicinal plants and authentic, native vegetables. The whole site will be designed to deliver zero harmful emissions and every function on the site will be linked, providing an input, to another function, so there will be very little waste. It will be integrated from a sustainability point of view. The social dimension of the sustainability principles will be embodied in the way that the community will be organized. The group is developing a cooperative structure that is very innovative, and completely unique in the context of governance in the Bedouin society, which tends to be male dominated, hierarchical, tribal and clannish.

Russ: *Have you examined adult developmental psychology at all? Any of the models such as the work of Michael Commons, Robert Kegan or Don Beck and Chris Cowan on Spiral Dynamics?*

Michael: No, I must confess that psychology is an area I'm especially weak in. I've read things through the years but that has not been my focus.

Russ: *The reason I ask is because of the way in which you are addressing the social. Particularly in the case of Spiral Dynamics, there is material on my Web site and a book entitled Spiral Dynamics. I would encourage you to take a look at it as a way of tapping into a framework that may give you some important insights in that arena.*

Michael: I'll look into that. Incidentally, I don't know if you had a chance to look at the Design Science document I developed, which was published on the web site of the Buckminster Fuller Institute. You can see there how the spiral has been used as an imaging icon for the process of design.

Russ: *Yes, I recall that. Could you elaborate on that? How is the spiral representative of the process of design?*

Michael: You need to accept a definition of design that goes beyond the conventional view of design as having to do with an arrangement of objects or what-have-you. Normally, we use the term "design" in a very narrow way. I think there's the possibility to look at design in a much broader sense as a concept that indicates some sort of underlying order. You start with that, a notion that means some whole that is marked by a consistent coherence, which of course, implies some deliberate intelligence. Fuller, for example, used to say that the whole universe is a fantastic piece of design. This is how he used the term. So "design" is basically given the connotation of an underlying orderliness.

If you think of one of the unique and important functions of human intelligence in the cosmos, it is to produce unique designs and act as a local cosmic feedback loop in the process. This is the opportunity that we have with our awareness, consciousness and intelligence. It is to progressively create more order, although often we do not act that way. Arranging and rearranging events in comprehensively preferred ways demonstrates the potential of the fantastic capability that we all possess as universal designers. So when you look at it from this point of view, you can come to a new definition of design. You can define design, in the most general sense, as being the process of realizing intention. The process itself has to do with applying intelligence to physical processes and it comprises a number of steps ranging from an intention to actually realizing that intention.

You start with an intention and then there is an action to reduce that intention to practice. There is a process that moves from the intention to the realization. If you think about that process a little bit, it would have the typical structure of purposeful behavior in general. This is where there exists an important link with psychology, where the intention obviously corresponds to a goal and the later corresponds with projecting ahead a preferred state, as we talked earlier. So you have got the goal, you have got the realization process, the activities required for realizing the goal, and then, you have the process of evaluation, which is the feedback function where you see whether you achieve the goal or not and whether you have to continue and try to realize it or you can move your attention to something else.

So you have got the three major aspects of intention, realization and evaluation, which are linked in a circular framework. But you have to be able to evolve. So you have to be able to break free from this circle. In order to jump out of it, once the circle is complete, you need to connect to a new more comprehensive, more inclusive intention and you move to the next circle level. That’s what creates the spiral. In relation to each circle level, which comprises a typical feedback loop situation including intention, realization and evaluation, you need to be able to accommodate the possibility of learning, adaptation, and the kind of shifts that are involved in evolutionary expansion of context.

This requires that each such circle—each closure—will be opened up to the next more comprehensive cycle of integration. If you take the circle and open it up to the next circle and the next one, you’ll get a spiral. A spiral is an entity that expands. It can be used as an iconic representation of evolution. Evolution, whether biological, social, cognitive or whatever, comprises basically an expanding process. If you contemplate it further, you might say that what is actually expanding in the spiral is a quality we call “experience.” It’s the experience of the cosmos itself that is becoming more comprehensive as we go through those cycles.

Russ: *And it’s probably replicable at multiple levels. You indicated experience with the cosmos, but the individual and the social systems can go through those same kinds of dynamics.*

Michael: Absolutely! But in the same breath I’m also saying that the individual and the individual’s design—the individual’s invention and social design—are part of the cosmic experience itself. We think that it’s our experience, that it is all about us, as humans, but it is not. It’s something greater that is working out its purpose. It accumulates its experience through all the possible manifestations including us, our thought, feelings and actions.

Russ: Fascinating. I'm wondering if in your work on sustainability whether you see yourself engaged in a political process. I'm assuming the answer is yes, and if so, how?

Michael: I have avoided the political process, and no, I don't intend to engage in it. The main reason for this is that the political process requires a tremendous amount of compromise. I think that in order to understand what the issues really are, and how best to approach them, you need to avoid compromise as much as you can. I prefer to work in this way.

Russ: It occurs to me that one of the other arenas in your life has been attention to issues of peace. Can you expand on that?

Michael: I think of peace more of a derived consequence of many conditions rather than a result only of deliberate activist focus. I was born and grew up in Israel, so my whole early experience has been an experience of a region that is torn by conflict. Having lived outside of it for many years now, I can also see the potentials very clearly, of what things could be if energies could be diverted from conflict to more creative modes of being. Over the years, I became involved in some peace efforts. I served on the board and for a while as its chairman, of an organization called Givat Haviva, which brings together Israeli Arab and Jewish youth just so they can experience each other more directly and get away from stereotypical ways of thinking about each other. It's very important work, but very slow, and really a drop in the bucket.

The project that we are doing now could have an important impact on government policy with respect to the Bedouin minority in the Negev. One of the ideas we are discussing is expanding that project and doing something collaboratively with a group of Bedouins in Jordan. If you start that, you can clearly expand very effectively on issues of peaceful existence between the two countries. In all of this, though, I am trying to create peace conditions through concentration on something else. We are not involved in peace demonstrations in the project, but we are trying to create a thriving community in a way that can demonstrate that there's really no need for destructive conflict if you collaborate. Incidentally, with the Bedouin project, the kind of coalition of people in organizations that we were able to put together is absolutely unprecedented. It shows you that when a group of people really wants to focus on an ideal and sincerely try to achieve it, anything can be possible—and that, can rarely, if ever, be achieved through conflict which is driven by fear. Of course, in relation to the five sustainability principles, I think that the fifth one viewed in relation to the social reality would see a condition of peace as a prerequisite for a thriving society and a happy, thriving future for many reasons.

Russ: It seems to me that the sustainability principles are really the domains of both design and social action.

Michael: Absolutely!

Russ: I said "social action," but I guess I mean just action. Period.

Michael: They are actually very powerful. I don’t mean it as a self-serving statement, but the principles are very powerful if you think about them as guidelines for organizing action, for developing sensible policy or designing the necessary change.

Russ: Where do you see yourself moving at this time? In what domains will you be putting your energy?

Michael: The Bedouin Project is consuming a lot of energy and time. I shall continue with that to see it through, but I think I shall be switching my attention to the evolution of the Lab itself, as a vehicle to support activities like this one particular project.

Russ: Tell us about the Lab.

Michael: I started to work on issues of sustainability and sustainable development largely in the context of the multilateral organizations that deal with issues of development: organizations like some U.N. agencies, the World Bank and others. Both in that arena and in the private sector where some concepts of sustainability are being pursued, there are real limitations on how far existing institutions can go for a number of understandable reasons. It took me some time to fully appreciate that. I thought that I was operating at the center of activities furthering sustainable development until I realized that there was a huge gap between the prevailing rhetoric and what was actually happening on the ground.

It took me some time to realize that this was not because people are bad or they don’t want to do the right thing, but because the whole framework within which we operate, both in the public and the private domains, is extremely restrictive in that sense. In the private sector, we operate under an economic accounting framework that is really driving us in the wrong direction by distorting reality enormously, for example, allowing us not to take into account what economists refer to as “externalities”—the impact of pollution, the impact of depletion and so forth, but even worse, allowing us, in many instances to count consumption as profit.

If you were a CEO and did this with your company’s accounts, you would be put in prison, but that’s how we operate the planet. We deplete the resources and think we are getting rich. That existing framework constrains what any CEO or any given company can do before they reach the very low ceiling of acceptability—of dealing with shareholders’ value and all those familiar restrictions. In the multilateral arena, it’s the political restrictions where you have to operate by consensus. The arguments around achieving a consensus go in a direction that takes you further away from the problem itself. By the time you reach the lowest common denominator of what is acceptable to all, you are dealing with a “solution” that is so far from the essence of the problem involved, that there is no correlation between the two anymore. This is why a lot of development policies have not been very successful.

It occurred to me after experiencing that world for a long time in projects all over the world that it would be very useful if there would be an independent entity that could actually experiment with breakthrough approaches without worrying about the conventional frameworks of both the conventional economic and political varieties, and create a portfolio of success showcase models, demonstrating true paradigm shifts in different necessary arenas.

The lab will focus its work in four key areas: on questions of strategy —approaches to demonstrate sustainability in development, for example, on technology, financing and education. I am not trying to define what the lab will do through defining problem areas or specific development objectives, but rather by those four functional areas. In each of those, we would identify an issue that needs to be addressed, and bring the best possible talent and process to bear on creating and demonstrating a model approach that others can review, adopt and scale up. This is basically the idea behind developing a prototype sustainable desert community with the Bedouin's.

That's what the Lab will try to do. I hope it will attract some attention and collaboration with a number of cutting-edge institutions. At the moment we are working with two: one is the Blaustein Institutes for Desert Research of the Ben-Gurion University of the Negev in Israel where a great deal of cutting edge work is being done on solar energy, water management, desert agriculture, and so on, and with EARTH University in Costa Rica.

Russ: *If anyone wanted to learn more about your Lab, what is the URL for it?*

Michael: It's www.sustainabilityLabs.org.

Russ: *If there's an interest in becoming more involved in the work you're doing is there an avenue for that?*

Michael: All that needs to be done is to contact me directly at muben@aol.com, but there is also Lab contact information on our Web site.

Russ: *Michael, I deeply appreciate the opportunity to speak with you. I'm very impressed with your range of interests and energy and I am sure we could have a dozen more conversations in great depth. At least this has served as a foundation to get the key elements out there in front of a larger public that will pay attention.*

Michael: Russ, I very much appreciate the opportunity and I enjoyed talking with you.

3D Democracy: An Interview with Jan Inglis

Russ Volckmann

I have known Jan Inglis for several years as we are co-directors of ARINA. Also her articles have been published in the Integral Review of which I am an associate editor. I know that she has been very focused on using developmental and integral approaches to respond to some of the very complex issues that challenge us these days, specifically climate change. I was curious to know what motivates and sustains someone to work in the public realm since many people in the integral or developmental field have chosen to focus instead on personal development, organizational leadership or academic teaching. I also wanted to know what specific and effective methods there might be for how communities are engaged in political or social issues considering that I recognize that people are all over the map when it comes to their diverse lines and levels of development.

Russ: *Jan, I'm so glad to have the opportunity to chat with you today. I'd like to start by asking about your interest in politics.*

Jan: I haven't been directly active in what most people would consider politics—as in party politics and lobbying. But I have been involved in public decision making which is the broader definition of politics: how we make group decisions regarding public issues. I call it "3D Democracy" referring to the multidimensional aspects of decision making. That interest is a continuation of earlier observations in the work I was doing re how people make choices—how they weigh things out and subsequently make decisions. I've long had a fascination with that.

Russ: *Is there a particular context in which you've been concerned about that, or is it across the board?*

Jan: A long time ago, I was working as an occupational therapist with people who had many types of disabilities. They faced multiple physical and emotional challenges. I would observe how they responded to those challenges; there were incredible differences in how people would rally to face those challenges. I was fascinated by how people arrived at their choices, what supported them in the context of their beliefs, families, their culture, etc. That was something that moved me into the field of therapy: Integrative Body Psychotherapy. I did a lot of work with the internal processes of how people looked at their issues in the context of their values, their current sense of energy and what they assumed blocked them from getting what they wanted in life. I noticed that as they would examine what was in the way of them achieving their goals, and look more deeply at potential influences such the history of their childhood patterns, and assumptions they were holding, this would change their relationship with their "problem." They could find ways that those blocks could surface, be sorted, understood and coordinated and it would help them move forward, beyond their obstacles to make healthier choices.

Russ: *At that point in your work did you notice any patterns?*

SOME RIGHTS RESERVED

Jan: The more self-reflective people became, the more they were able to look beyond their external problem situations and examine their internal responses to their situation: was it based on assumptions that had been holding? did it have to do with how their assumptions might be different than those of other people around them? So that capacity to inquire and see connected layers underlying problems and be self-reflective made a huge difference in how they created new options and resolved their situation.

In parallel, I was doing a lot of community work and dealing with issues regarding the environment, social justice, and peace. I was looking at how this process of self-reflection, that seemed so available and worthwhile for individuals, wasn't present when we were in our public groups. Behind the closed doors of a therapist's office, individuals were able to become more aware and create change, but there was little transference to how that showed up in our cultural work and social change efforts.

I became increasingly concerned about environmental issues some time ago and felt we needed to find ways of ways of looking more deeply at the patterns re how our problem issues have formed and were impacted by our views of them and each other. It was that question of how we make decisions—and why we make such bad ones that endanger our very survival—that eventually pushed me into looking more deeply at adult development in a social context not just personal growth. This opened up a whole new field of understanding about why we had differences in how we approach things…and why change is not simple.

Russ: You're addressing both individual levels of decision-making and all that is compounded into that process, as well as how communities are engaged in that process when it comes to political or social issues.

Jan: Yes. For quite a few years, there was a disconnect in my work and in what I saw occurring around me that felt really uncomfortable. My therapy students could be doing a lot of deep personal work, but not have any concern at all about the health of their communities or world. Or, I could focus on the bigger issues in the world but work with people whose own dysfunctional way of communicating with others was actually a key part of what was creating the issues, and they were totally unaware of that. I felt I needed to find a way that could bring coherence to those two fields. At that point, they were two separate fields; inner personal work or outer community work. I felt that I needed to work on them together, not just view them separately and needed to find a method to pull them together.

I was doing a lot of reading and research and understanding of what other people saw regarding this. I found some of Wilber's early work—he mapped out the exterior and interior—and it was helpful to have that split acknowledged. I knew I wasn't the only one feeling the split and that it was part of a larger context of development.

Working with Integrated Body Psychotherapy was helpful because it was about working in real time—not just from a conceptual understanding of what was happening in terms of problems and issues but with the experience of being present and the impact that had on our ability to observe and understand. It was an integrative process as well, supporting people to focus attention into their gaps and make sense of what they were seeing. I moved on into studying Bohmian dialogue, Spiral Dynamics, Robert Kegan's and Bill Torbert's work . And meanwhile I was learning from my own processes as well. I was seeing that my community work focused on the issues being "out there" and a lot of my earlier activism had been about finger pointing and blaming "those" people "out there" that were doing those "bad" things, whether it was the corporations or the politicians. As I became more aware of my own processes and question this patterns of blaming and creating "in" group "out" group polarities, I was also seeing how that perpetuated the very issues I and others seemed to want to resolve. It is so easy to blame, harder to get at dealing with it all being about 'us.'

Russ: *Given your professional background, this probably came relatively naturally to you. In addition to the reading, what were the kinds of things that helped you bridge that distance of consciousness and understanding?*

Jan: I've been lucky to live outside of the mainstream culture most of my life. I grew up on a farm where you really do get a sense that everything is connected. My father was very involved in the cooperative movement and concerned about the common good, and also money was only available for practical things. So the combination of all those things meant I wasn't part of the consumer culture very much. Although that was not much fun as a teenager, I think that allowed me to follow things of interest as an observer rather than an enmeshed participant. In the early eighties, I came across Joanna Macy's work, ecofeminism and deep ecology. I was doing programs with groups and really seeing the difference that could happen when minds came together. I was part of intentional communities and started working with consensus decision-making, mediation etc. I was searching for a method under which we could come together as groups but finding limitations of all those previous processes. I found there was a lot of great intentions and 'feel good" energy in much of the personal and spiritual development work but none of this was sufficient to actually, pragmatically, assist us in responding to the complexities of our social ecological or political issues. In fact, it seemed to serve as a distraction.

I felt I needed to find something else—I was looking for something to help me understand the process of how we make decisions in a way that groups or cultures can create change, much in the same way I had found change could be supported to happen step by step with individuals …... I came across the work of Sara Ross. She had taken a lot of the large fields of research and theory about adult development and behavioral sciences and complexity, and put them into a form that could be applied at a community level.

Russ: *I'm interested to learn more about the role of marginality or the role of being at the boundaries of social systems that has its implications for people in their development. It sounds like it was important in your case, and it resonated with me. Is there something in that we should discuss?*

Jan: There's a certain push and pull in that. There's a sense of wanting to belong, at the same time as wanting to individuate and not be enmeshed with a group or culture. You need to take a step back to see it and yourself in that. The tension feels like a struggle and a gift.

One thing that helped me in my early career when everyone else was only focused on career moves and earning a lot of money, was that I came across the work of Joe Dominguez and Vicky Robbins. They had put together the "Financial Independence: Your Money or Your Life" material especially for people who were headed into being social change agents. Working with them made me rethink my goals and evaluate how I was putting my money, time and my life towards them. My biggest goals were certainly beyond just gaining more paid holiday time, or making car payments. Their work helped me validate my priorities. It offered an articulation and a concrete doable structure for how to step back and look at the whole idea of working just to earn money and helped break the trance of that aspect of mainstream culture. So to answer your question…I guess that marginalization can be another name for outgrowing the old forms and not yet settling into the new, and so that means dissonance which offers motivation to find a better way. But besides dissonance we also need supports such as models and methods of better options and validating experiences so we can move to a more satisfactory next level. I am very grateful that I have found both internal and external structures that have supported me… although there have been some times on the desert.

Russ: It's clear that all of us go through a variety of developmental experiences in our lives and we find ourselves centered in different levels or sets of capabilities on multiple lines. One thing that I'm curious about is that when we're working in a collective context, we're dealing with people who are all over the map along those lines. Is there anything that you discovered in your work on adult development that was an important lesson for you around working in collectives?

Jan: Initially when I was a therapist, I could see the great changes that people could make. So then I jumped to an assumption that if everybody could just get on with doing some inner work then that was what was needed to change the world. I felt that was what everyone could and should do and I felt they could do it in a short time. From the lens I was looking through then, I failed to recognize that this capacity for self reflection was just not available for everyone. Eventually from my own observations and understanding from adult developmental theories of Robert Kegan's, Bill Torbert's and Michael Common's I came to respect the fact that we're all going through different places at different times based on many different aspects and life conditions. The stage we are at is just where we have to be. Then social change work wasn't about pushing someone else to do something; it was about looking for structures that could intentionally hold the richness of that diversity and work with it as active grist for the mill.

Russ: One of the big challenges is the creation of structures that allow for the richness of that diversity to be brought together to support our collective creativity and innovation. I'm wondering if there's some patterns or principles around structure that have been significant for you.

Jan: The term “scaffolding” is being used to describe what it is that supports us as individuals to develop, and what supports us as groups to deal with more complexity. I think that with the challenges that we’re facing—the climate change or any number of issues that we’re dealing with: economics, health care etc. — these are all such complex issues. But we’ve attempted to deal with them in a simple, linear way. And our public interactions are tending to come from a very adversarial stance. We need processes that are as complex as the issues. We need systematic methods of dealing with issues, but we don’t have processes in place in our politics for dealing with them that way.

I think our public processes need to be designed to match the challenges of those public situations. I think we take our public interactions, like politics and community development, for granted. We’re not seeing how poorly we interact. We’re not seeing that by using an absolutist form of thinking and talking together that it forces us into simple yes and no responses, inadequate for complex issues. That doesn’t allow us to bring together the diversity of perspectives on the issues. We are not seeing that the issues exist in relationship to the whole context of other issues. We’re not seeing them as a system, within systems, that is, as a metasystem. We’re trying to deal with poverty, violence or climate change as simple issues when they are truly complex. One core principle then is to commit to methods to address the complexity of our issues. They need not to be dealt with as fragments, but rather integrally.

Russ: How would one go about seeing the diversity of an issue rather than the diversity of the population around the issue?

Jan: We need to see and address both. There is both the multi facets of the topic issue that make it complex like crime for example, and the multiple perspectives within the population regarding potential solutions to crime that need to be considered before we can agree on and support actions. So we need to see the issue within this broad context. For example we tend to talk about climate change as though it were a single “it” and really there are many diverse aspects and sub issues and they all need different ways of being responded to . We can use the movement towards biofuel as an example where one perspective of a “good” solution was used without adequate exploration of other perspectives or implications. Converting fields to corn crops to produce biofuel supposedly was a solution to create alternatives to fossil fuel but it was done without considering all the repercussions that it would have—impacts on markets, on availability of food, land use, etc. When we don’t look at an issue’s interconnectedness, that’s a failing on our part. To gain a broader understanding we need to work with those most knowledgeable about the issue, who bring necessary and diverse perspectives based on their life experiences. Starting with inquiry into the context and causes and creating a map indicates graphically that issues are complex and very interconnected, and gives an understanding of why we will need deeper consideration than just quick fix it solutions.

Russ: I think of what you’re saying as a shift in the way we think about phenomena. it takes us from an engineering perspective to a more gestalt examination of the phenomena.

Jan: Yes, absolutely. Everything's connected and you can't just pull one string without knowing that it's connected to other threads in the tapestry. Yes, the engineering model would have been an approach to a single cause, a single problem and was based on the assumption that we understood the problem, could just plug in the solution and then predict the outcome. That's a very simple, linear approach, using formal logic, instead of realizing there are many causes and many effects that have to be understood within a context, a post formal logic. Part of the 'gestalt" is the many very legitimate perspectives that are connected with the phenomena. So being able to talk about "the" problem in terms of the many perspectives that we bring to it is absolutely necessary.

Russ: We're touching on one of the added values of bringing a complexity theory perspective to issues. On one level, it's about recognizing that everything is connected; on another level, there are other lessons that can be drawn from that complexity perspective. such as small changes that can create large results? Interventions can be less grand than the whole phenomena itself.

Jan: Well I look at the enormity of all the things we're dealing with on the planet and can wonder where I should start. It helps me to recognize that if we work with the patterns of how we interact and make decisions, and even if that is just one group working with its issues in a different manner than they have before, that that is setting the potential for a bigger change. That learning can then be used again and there's an incredible impact of how that can ripple out. Without digging too deeply into complexity theory and patterns, it's vital to recognize the importance of what happens when we are able to change a pattern and have it work at a level that is more adequate than some of the structures of thinking we've used before. This gives me hope.

Russ: So it's not just about structures and processes, but it is also patterns over time. By intervening in a way that alters one of those patterns, we're beginning to build the neural networks among us that allow us to shift the patterns to make them more effective in the future.

Jan: Yes, I think that nothing is isolated. If we're learning something and reflecting on it, then that can become something that we will start using and eventually over time can consider institutionalizing. That then gives us the foundation upon which we can build our next pattern and a culturally recognizable way to deal with the next issues that we'll be challenged with. Hopefully we will move beyond thinking our minds operate in isolation. And it is exciting to think that at some point we will be able to have neurobiological evidence, not just social science evidence of those changes which are occurring.

Russ: You've referenced Sara Nora Ross' work. I wonder if that's an example of an intervention or a set of interventions that is about changing patterns.

Jan: Very much so, and I think it works on a lot of levels So much of what drives evolution is dealing with challenges and unmet needs and finding ways to resolve them in a more complex way than was available before. Right now, we have big challenges and potential for major unmet needs as a result of climate change and we will need to evolve to deal with them and that involves collective decision-making. We can be supported to do this better when we work with the universal developmental patterns underlying how humans make decisions.

These are built into the process that Sara developed, which is called the TIP Process—The Integral Process for Working on Complex Issues—within that there is both very specific and detailed methods of working with the community or group to make a decision on complex issues. There is also processes that scaffold our individual development and the group's capacity to work together. It's designed from a developmental and behavioral science understanding. It also supports us to move forward because we're having to face into the complexities and interconnectedness of issues and multiple perspectives that we bring to the issues. With a series of steps we can move through that process. The issue we're working on can benefit and the individuals and groups that are working on the issue can also increase their capacity for more complex thinking.

Russ: *Can you expand on what that process and those steps are?*

Jan: Sure, I can attempt to go over the basics and hope the answer does not get too long. A lot of the first steps help us build a sense of focus and attention, which is lacking in a lot of our public interactions. We often just come in to a meeting, and just start to talk and we're all over the map. We're talking about some general topic assuming we are meaning the same thing but we haven't really agreed about what the main focus is. There is a need to be able to help people focus and build their attention span, and do this in a manner that isn't triggering an absolutist stage of thinking where we fight over the 'right' or "wrong" answer. Using the action inquiry process that Bill Torbert had put forth, we inquire into our understanding of the issues. In that way, we start to build a common meaning of what we are thinking the issue is really about.

Some of the early steps include seeing the issue in its context with other things and building a broader understanding from hearing different people's views. We need to use inquiry to get us beyond thinking there is a right or wrong way to see an issue. This sounds simple but it is where many meetings regarding a public contentious situation get stuck. So in the first steps we're building the basis for more complex and connective thinking. We move through understanding what the issue is, looking at how it got there and its root causes. That takes us below the usual surface desire for quick fix solutions to starting to make connections between multi-causal points of how this issue came about. We move bit by bit into understanding what the causes are in relationship to our behaviors as individuals, or as whole group or community policies, or non profit, business or government practices and priorities. And also how these reflect our individual and organizational values and attitudes. When we get to a point where we define causes and priorities of what we want to focus on, we have a much larger context to work from than if we were just working at the quick fix solution level. We then are deeper into the systemic understanding of an issue after these earlier steps, so then our choices of actions are likely going to be more systemically focused.

One thing that happens in politics and in our public interactions is we don't trust people's capacity to know the issue very well. But when given this kind of scaffolding and by asking people, we find they do know what their issues are, especially if you provide a setting by which they can actually explore their knowledge of issues together. Then they can start moving towards agreements and come up with some responses and create potential solutions that could shift the deeper aspects of their problematic issue.

There is a method of framing the naturally-occurring multiple perspectives, so we see it is not just my favourite perspective against yours, which is quite often how our public processes work. Instead we're going to examine the fact that there are 3-4 different perspectives on how we should proceed and deal with this issues and come to realize that of course our response to this issue will differ based on our perspective.

That, then, moves us into the next step, a process of "deliberation." I realize that that term probably requires some background. We all deliberate all the time, but we don't realize it. So for a real life example, —remember when you and I were in Oakland at the Integral Theory Conference and you gave me a ride in your Prius? I remember you saying that when you bought it, it was an "easy" decision to make. I was thinking that while the decision may have been easy, there must have been an inherent deliberation as you calculated how best to satisfy your needs in your choice of car. You probably considered the purchase from the point of view of several needs: first, a security need, that is the safety of the car, and your financial ability to purchase it. Second, a stability and accountability need, that is your view of the reputability of the company and its ability to make and service the car. Thirdly, a competitive or entrepreneurial need, that is, is this the best car in the hybrid market. Then you settled on your more obvious responsible citizen motivation, that is, the impact your purchase would have on the planet. Within that 'easy" decision , there is the whole universal stack of viewpoints and needs that probably were sorted through unnoticed but had to be met before you could arrive at an easy decision.

I think we do that kind of internal deliberation all the time. If you take that and apply it to another entity—say you sit on a board of a nonprofit organization—then you add a whole different level of complexity. Now it's not just you deliberating; it's a group, with different needs, and priorities that all need to be considered and included before reaching a decision that everyone can support. If you move that up the rank to bigger and bigger entities such as the State of California buying a fleet of cars you add more complexity and layers that need to be considered to reach a decision and take action.

So with more complexity we need to be more intentional about including all the factors or our attempt to reach decisions will bog down or not feel satisfactory. We have to weigh costs, consequences and trade-offs, and we need a structure to do that well, especially with public decisions. If we simply leave our decisions to leaders we can end up with an apathetic, passive or frustrated citizenry and likely bandage approaches. We need more participatory and deliberative decision-making so people can go through and weigh out the decisions that impact them. They can look at costs and consequences that affect them. By the time a decision is reached, we can take action on that decision as a public because we spent time examining the trade offs. It isn't just a reactive decision, which is quite often what our usual public processes set us up to do.

Russ: *You're talking about something critical. It brings us back to this piece about the developmental levels of participants. Have you considered the values of people who might have different worldviews and different capabilities around hierarchical complexity or subject-object relationships? How have they been able to transcend those differences to work together deliberatively?*

Jan: Yes that is a core aspect. The invitation of different viewpoints in the exploration of the issue and in the people talking about the issue from their real-life experiences is accommodated in what is called a framed issue booklet. These diverse perspectives or frames of reference clearly describe the legitimate views and we can see these issues from different places based on different life experiences. The differences include those same universally different voices which occur inside us, just like the ones I was saying you might have needed to listen to in your internal deliberation about what car to buy. We need to ensure that those different voices are included, and especially included as concrete examples of where they do rub up against each other and create tensions in our communities. The deliberative process is built so that tensions between these different viewpoints are used, not avoided. We're using the diversity to push our process to come to terms with the differences and reach a more complex understanding and do it in a way that the diversity is both welcomed and necessary. It is giving people a clear shared way of meeting with no bias as to what perspectives have been invited onto the table.

We're so often are used to being scared of that diversity and we don't know how to give it room at the table. Without structured process and with just open-ended speaking or blurting—like what occurs at town hall meetings—we just push against each other and the diversity of voices creates arguments and isn't given equal space so we can learn from each others real experiences. By doing a developmentally-designed deliberative decision-making process, those different voices don't have to compete, because they're actually given space and attention, not just to be nice, but because they are necessary to forming complex decisions and that result in many people being motivated to being involved.

Russ: *I'd like to examine this from game theory. There are zero-sum and non-zero-sum games. Zero-sum allows for winners and losers. I'm thinking about things like the legitimacy of gay marriages. In issues like that where there is an either-or decision it seems to me there is no deliberative process that will bridge the gap for those who are deeply committed to their blue values versus those who want to create a space to allow for diversity.*

Jan: Quite often we start talking about an issue and give it a label without taking time to flesh out the sub-issues. The issue of gay or straight marriage has been a topic that is laden with multiple issues. To go back to an early principle of the TIP Process, we need to look at the topic systemically and be willing to open it up and examine other possibly connected issues that are there. If we're trying to deal with it simply, it will be narrowed down and will force people into an either-or camp. By doing so, we're ignoring the complexity of the issue and no one will end up with a satisfactory result.

Russ: *So that could result in using this example to break down the intricacies of an issue—for instance, how do we allow gay couples to see each other in hospital rooms, get health benefits, etc. How do we make it possible for them to have the same kinds of rights that heterosexual couples do?*

Jan: Looking at those topics, what are the many other aspects that are connected to views and needs re hospital visiting or health care that make it feel problematic to address for certain individuals or groups ? There are issues regarding a whole context of intricacies: cultural history and identity, economics, social structures, legal aspects—there are many things connected to the issue. So you need to consider which issue is the troubling tip of the iceberg topic and how can we have the quality of discussion to examine the root causes, so as to look deeply and systemically at the issue.

Russ: *Are there further steps in the process?*

Jan: Yes an important step is that once the group has moved through the deliberation process, then decisions needs to be made, actions taken and coordinated over time. In North America there is more of a movement towards more recognizing citizen engagement and building better processes. A lot of these processes though aren't designed so that there are actual decisions made that people can take specific actions on. Many citizen engagement processes are used for public dialogue or ways to gather public input only. But to get to where we can make informed decisions and engaged actions, there needs to be steering committees who support the actions and follow up to maintain coordination and follow-through. It's not just people talking conceptually about something—they need to actually work through steps to take action on something that challenges them. It is only through this real involvement with real issues that we get the systemic results on issues that we need and evolve the systemic thinking we need.

Looping back to your earlier question about politics and political involvement—when there is group decision-making that can lead to action, some of those actions will be policy, and some will be volunteer initiatives by individuals or groups. It's this broad based comprehensive involvement that shifts and activates our politics in a different way.

Russ: *Does this approach operate within the existing structures of government as well as outside these structures?*

Jan: I think one of the challenges that has happened in the field of public engagement is a that a sense of separation has developed between elected officials and ordinary citizens. That's a gap that needs to be overcome, and trust rebuilt. We need to define our issues, work on deliberating them and choosing action with ordinary citizens and public officials working on them together.

Russ: *So this process makes it easier for any kind of structure that's created or currently exists to open the door to multiple stakeholders.*

Jan: Yes, because multiple stakeholders are those who are impacted by the issue or can impact the issue. Those people all likely have different perspectives, so there voices all need to be in there.

Russ: *The kind of approach that Obama has been advocating for, which is essentially a learning political system as opposed to a confrontational political system, is not unlike what you're talking about. Essentially it's about getting people from diverse points of view engaged and arriving at decisions to take actions. We can evaluate and adjust those decisions as we move forward. Is this parallel obvious to you?*

Jan: Many people who are working in the field of public interactions are feeling excited and hopeful about the climate regarding engagement that the new Administration seems to stand for. Seeing it as an educational process is so appropriate because we need to learn how to make decisions together. We fail to see that as a learning process. Engaging in a developmentally-designed and deliberative process—whether it's a small nonprofit group or international consortium—requires a pedagogical aspect. It is action learning; we do it, we reflect on it what worked or didn't, and decide how to do it differently the next time. We learn about not only the issue, but also about the process of working on issue through participation not abstract theory. We learn about how we can change our culture by doing that. We also need research to see if what we are doing makes a difference, and develop training programs for those who want to be agents of social change.

This all needs that "scaffolding," that support built up over periods of time and I think that certainly has been one of the big challenges of trying to bring in a different process into our politics. People are still hoping for quick, short-term, low-investment processes. Let's get at it, make a decision, grab the answer and get going. People's attention spans to actually ask those bigger more complex questions need to increase—What are the different perspectives? How is this issue related to other issues? What do we need to consider in terms of trade-offs? What actions will we be willing to agree upon? It takes more time and commitment to use structures to help us make our decisions wisely, but really wastes time if we don't and considering the state of the world we cannot continue being so sloppy in wasting time. We spend a huge amount of time dealing with the bad decisions we've made. It's a difficult thing to get across. Until people understand that public decision-making is not an easy task, they won't agree with the need for a different process or an educational approach.

Russ: *One of the big challenges is first attracting a sufficient number of stakeholders to engage in the process, because it's different than what they're accustomed to. There are structures in our society that militate against it that also need to change. Two examples come to mind: (1) In regards to the Obama factor, there are major power-holders who are taking a strategic approach that acts against those kinds of stakeholder involvement developmental processes; (2) Our media—it seems to me that public media has a* *tendency to couch things in either-or terms, to set things up in opposition to increase rancor, further divide people and make it more exciting. There is a whole media culture and political culture that we're dealing with historically. It creates a challenge that needs to be addressed. The strategy of building on success is a wonderful one, but are there other activities that you see that need to be introduced to help us move in the direction of such a process?*

Jan: I agree that our tendency to having a short attention span and to see things simplistically while at the same time sensationalizing is a huge challenge. As we move through our natural stages of development and see that there is more complexity to our issues, we may notice that we don't get results or a high level of satisfaction when we operate that way. Hopefully we'll realize that those processes are taking more resources and keeping us trapped from our key issues like our economic crises or issues with water or food. If we can build in a self-reflective process that demonstrates why issues take a lot of time to resolve well, we may be able to find ways through them. I think that hopefully we will be able to institutionalize different decision-making processes into our culture that keep us from jumping into those either-or camps and impeding the process towards more systemic social change efforts.

There are more instances of media using inquiry. I hear more situations where media is now reflecting on its own self and the bind they get in when reporting on touchy issues. There is more awareness that shoveling fuel onto that fire isn't necessarily the best move. I'm seeing more capacity for self-reflection within the media and certainly within some of our governance. Would I like to see it happening faster? I certainly would. That's what my work is about.

Russ: Yes, and it's parallel to the kind of strategy that Ken Wilber implicitly and explicitly been manifesting around trying to build a critical mass of people with development and experience that can help move society forward in a developmental path.
What are your next steps?

Jan: One thing I've jumped into recently is making a documentary film. I don't see myself as a film maker although I did make some films quite a few years ago. I feel a film needs to be made regarding the challenges in our public interactions and our decision-making. A lot of the material regarding better processes regarding our social evolution and adult development stays within academia. I felt that it's not very accessible for people there. I wanted to use the type of imagery and metaphor that could be available in video for a documentary regarding the challenges that we're facing re climate change and the gaps that we have in our capacities to respond. We need to focus and concentrate long enough to consider different perspectives adequately to make decisions to deal with these issues. I'm in the process right now of putting that together.

Russ: Do you have a completion date?

Jan: I do—well, I keep setting one and it seems to escape me.
(laughter)

Jan: Either other things get on my plate or when we assume that we have a plan in place, our own processes of learning along the way changes the original plan. It's a dynamic process. I'm hoping it will be done in two months… I've done all the initial interviewing, so it just needs to be edited in a lively, coherent and accessible fashion.

Russ: And who have you interviewed?

Jan: I've got Thomas Homer Dixon who is very well-known in Canada—he's like a Canadian Al Gore. He does a lot of work in the field of climate change, and he is currently the International Governance Innovation Chair for Global Systems. He's written *The Upside of Down*—fascinating book. I've interviewed Robert Kegan who many people will know as being a developmental psychologist and the author of *The Evolving Self* and *In Over Our Heads*. I've interviewed Bill Torbert, another developmental psychologist and author of *Action Inquiry*. Also, Shawn Rosenberg who works at the Center for the Study of Democracy and is the Director of the Graduate Program in Political Psychology at the University of California in Irvine. I interviewed Sara Nora Ross who is an associate editor of the *Integral Review* and the developer of the TIP Process. I have been very privileged to gather so many viewpoints and such wisdom from these good people who have worked really hard in this field. I'm hoping to have the capacities and resources to put this project together in an interesting and inspiring way to be useful for those working on the climate change issues, or any complex issues, who are in the field of adult development and/or the field of public engagement and deliberative democracy.

Russ: I appreciate your spending the time with me, and I wish you all the luck in your endeavors.

Jan: Thank you, Russ, and I appreciate the effort you put into your work.

Russ: Thank you.

Integral Politics: A Swiss Perspective

Elke Fein and Hans-Peter Studer[1]

Abstract: This article tells the story of the Swiss NGO "Integrale Politik (ip)" founded by about 20 people in November 2007 with the aim of becoming a regular political party at a later stage (www.integrale-politik.ch). We wish to make ip's concepts and approaches known to a wider public. Inspired by integral thinkers such as Jean Gebser and Ken Wilber, ip develops its own ideas and interpretations of *integral* in view of the concrete challenges of Swiss and European politics.

Integral political culture is understood, for example, as including practices addressing all senses, turning political commitment into an experience of meaningful activity and an expression of joy, ease and celebrating life. One of the most important challenges currently faced by the group is to perpetuate and further develop this working culture as the organization grows. Its success in doing this seems to be one of the main reasons for ip's attractiveness to the Swiss cultural creative sector in general and the growing integrally-minded community in particular to whom it gives an increasingly visible face and a clear-cut voice. At the same time, the Swiss political system offers particularly favourable preconditions and thus, a fruitful ground for new political ideas and experiments such as this integral political one.

Keywords: awareness, creativity, democracy, holacracy, integral consciousness, integral economy, integral politics, integral society, integral working culture, spirituality, Switzerland.

This article tells the story of an NGO called "Integrale Politik (integral politics)" which was founded by about 20 people from all over Switzerland in November 2007 with the aim of becoming a regular political party at a later stage. Meanwhile, Integrale Politik (ip) has considerably increased its membership and considers itself probably the best organized and the most dynamic integral political force in Europe. With this "report from the field," we wish to make ip's concepts and approaches known to a wider integrally interested public in order to share some of the experiences ip has had in the course of preparing the establishment of an "integral party."

The History of "Integrale Politik"

The history of "Integral Politics Switzerland" reaches back to the beginning of the Millennium. In 1995, ip's founding president Gil Ducommun, at that time professor of

agriculture and development at the Swiss College of Agriculture in Zollikofen, launched a project called Holon, a network of holistically oriented organizations promoting new and unconventional ideas, especially in the field of economy. Holon was founded in March 1997 in four countries (Switzerland, Germany, Italy and Austria, with additional contacts in France and Belgium). Later, supported by Holon's network, a group called *dynamik5* emerged which for the first time set itself the aim of becoming a political party based on holistic views and principles. *Dynamik5* held regular meetings, had local groups, and produced several papers on specific topics related to holistic/integral politics and economics. However, because of difficulties to constructively integrate different personalities and opinions as well as the perspectives from different countries into one common project, the original aim could not be realized.

In hindsight, Gil Ducommun openly calls his personal "lack of maturity" and emotional competence the main cause of this failure, more important than substantial differences between the participants. As a leader, he concedes to have been overcharged by the task since he inevitably lacked some of the necessary capacities to build an integral party. One of the main lessons he drew from this experience was that a strong group was necessary right from the beginning which could not only pool together the competences and perspectives of its members in view of a shared vision, but also accomplish the necessary shadow work to compensate and transform individual or collective shortcomings whenever they appear. A similar group was missing in the case of *dynamik5*.

Another aspect which, in Gil's view, might have rather harmed than supported the development of *dynamik5* was a donation of 1 million Swiss Francs given to the association. Since this money had not been earned through "hard work," it in some sense prevented the organization from growing organically – and to build up the competences necessary to generate surplus income by its own efforts. As a result of these difficulties, *dynamik5* stayed a social project trying to introduce new ideas into public discourse instead of becoming a political party. Lately, it was fused with Holon and thus does not exist as an independent organization anymore.

Gil Ducommun himself then took a creative "time out" during which he published *After Capitalism. The economic order of an integral society* (2005, in German). After that, he tried to find other, more adequate ways of institutionalizing integral politics, still in view of establishing an integral political party. This time, he started off along with a few of his close companions, experts from the fields of economics, psychotherapy, as well as party-politics proper. A draft concept was written of what they thought to be basic principles of integral politics. On this basis, several more members were carefully selected. As a result, the so-called core group ("Kerngruppe") of 20 people emerged who later founded ip as an association. Before that, the core group, made up of ten men and ten women from different social contexts and areas of work, further elaborated the draft concept during a process of about two years of intensive work and cooperation.

The result of this creative and mutually transformative process was a white paper ("GLIP") of 52 pages on the foundations of integral politics ("Grundlagenpapier, GLIP," www.integrale-politik.ch/d/images/stories/dateien/dokumente/glp1.pdf) which now constitutes the substantial theoretical basis of the association. The paper deals with central dimensions of the current global crisis and proposes new ideas on how they could be addressed in an integral way. Amongst the basic elements of integral politics which the paper elaborates on are integral consciousness, integral economy, integral ecology, integral health, integral education, migration, and what ip calls “peace politics,” a new way of dealing with transnational conflicts in a globalizing world.

At this point, a few remarks are due with respect to the question: Why a party? This question is indeed asked again and again by people from the cultural creative sphere who are interested in ip’s work. In fact, “integral” and “party” seem to be contradictions at first sight, since the integral vision wants to unite and view the whole picture instead of mere partisan and partial truths. Instead, it is often suggested that integral actors introduce their values and perspectives into already existing parties and enter into a dialogue with them.

ip’s answer to these concerns, meanwhile formulated in a short FAQ text, is that firstly, integral consciousness, thinking, and feeling, for the moment, actually is only a part – and a rather small part – of the spectre of social and political world views. However, being a part that will try to look for integral perspectives and solutions, ip neither can nor should speak for all, even if it is prepared to perceive and appreciate all other opinions and perspectives. All it can and does try to do is to bring new ideas into the political process and to take care of promoting a political style of respect, awareness, and constructive cooperation. In order to become visible as a new culture, it needs its own “container” where integrally minded people can come and work together both to substantiate and concretize their vision and to publicly stand up for them.

However, ip is also only part of a larger integral movement, more precisely, its political part or aspect. The emerging integral consciousness is constantly gaining ground in most (western) societies. Now, it is in need of a political voice making it more clearly visible in the public and political scenes. While a growing number of non-political networks, NGOs, institutes, and educational centers give birth to integrally informed citizens, ip offers a structure for the latter to channel their efforts in order to bring about a deeper, integral transformation of society as a whole. Thus, ip sees itself as that part of the integral movement which brings together those who wish to take responsibility for implementing the integral vision on a larger scale. Let us now take a closer look at ip’s notion of “integral.”

What is Integral?

As mentioned before, ip’s predecessor organizations still operated on the basis of a different terminology, mainly using the term “holistic” (“ganzheitlich”) to describe their “spiritual, eco-social, European” aims.[2] The term “integral” is being used only since the publication of Gil’s book in 2005. In this sense, ip is giving itself a broader basis. Nevertheless, the main theoretical impulses of *dynamik5* have been almost fully integrated into ip’s thinking and position building.

ip’s use of the term “integral” is strongly inspired by Ken Wilber and Jean Gebser – yet without becoming dogmatic about either of them while elaborating ip’s own interpretation of integral in view of the concrete challenges of Swiss and European politics. ip's white paper therefore makes clear: "What 'integral politics' means, cannot be found in any encyclopaedia. It still has to be thought out, palpated and invented."[3] In this document, the term "integral" is defined first, following Gebser, as a newly emerging era within human cultural history, and second, as the level of consciousness of a growing number of people within this era, with consonant attitudes, ways of thinking and being-in-the-world.

---

[2] *Dynamik5* – ein ganzheitliches Gesellschaftsprojekt. Anregung zur spirituellen, öko-sozialen Partei Europas, January 2002.

On an individual level, integral consciousness is able to de-identify with thoughts and feelings while watching them from the perspective of a timeless observer (witness) and rather identifying with consciousness itself. Therefore, it senses the unity of all things and beings, an outlook which is able to generate a loving and compassionate attitude towards all things. As such, integral consciousness is thought to give birth to the new culture which Gebser was probably the first to call "integral" (GLIP, p. 3).

On a cultural level, integral consciousness thus increasingly transcends either-or dualisms such as of body and mind, left/right or better/worse by inclusive, intuitive ways of thinking and acting from the centre of the heart. Whilst helping to give up an exaggerated adhesion to materialistic values and attitudes in favour of a more balanced integration of the multiple human needs and potentials (such as social, emotional, spiritual ones), it enables creative freedom to emerge. At the same time, competitive logics are replaced by an attitude which seeks the good, the true, and the beautiful in every contribution, i.e., through transcending and including ever more aspects into ever broader perspectives with the aim to "protect and promote the greatest depth for the greatest span."[4]

Thus, instead of arguing against what it holds to be inappropriate, ip rather tries to develop positive visions. By the way, this self-set standard has important implications for ip's future interaction with other political parties. It is therefore aware that the way it communicates with external partners, counterparts, and competitors will be a decisive challenge to the organization's identity and reputation (see GLIP, p. 52).

Integral consciousness in ip's understanding invites the individual to an ongoing self-development in the sense of ever growing awareness of the levels of being and of one's own trajectory through states and stages (GLIP, p. 7). In view of policy outlooks and society as a whole, ip holds that integral politics is *liberal* in that it promotes the creative freedom and responsibility of the person. It is *social* in that it considers a factual equality of chances as a primary aim in order to enable the personal growth of all individuals. It therefore consequently rejects an unlimited freedom to enrich oneself and to accumulate power on the account of others. Integral politics is *ecological,* since it wants to arrange economy and consumption in a sustainable way bringing it into utmost harmony with the needs of nature of which we are all a part. And it is *spiritual* in that it values immaterial qualities and vertical, transformational development at least as much as material quantities and horizontal innovation (GLIP, p. 6).

These principles have led ip to develop quite visionary goals which, as of today, might still look somewhat radical, but which ip is very realistic about. For the group is fully aware of the fact that integral consciousness at a cultural level is still in the process of emergence, and that therefore some of the more ambitious goals will only be achievable within one or two generations. However, ip is convinced that “time is working in our favour,”[5] since to the extent that today’s materialistically oriented society and economy are confronted with their limits, and the more obvious the problems become which the latter bring about, the more people will have the courage to search for new solutions, individually as well as collectively. They will recognize, in ip’s presumption, that the present, mainly materially motivated striving for ever more possessions and consumption at some point has to be limited both for the sake of personal development, of social welfare and of democracy. At the same time, people are expected to increasingly share the experience: If we are able to gradually limit our material demands to what really serves our lives, we will become free to detect and live our social and spiritual potential in a new and fascinating way. We can only achieve true satisfaction and live deep joy if we seek them within ourselves, thus connecting ourselves to wider wholes and learning to transform the world (also) from within.

The Making of an Integral Policy Platform: The Example of Integral Economics

Integral political position building, for ip, is an ongoing process, which is why the governing board has decided not to publish a traditional party platform, but rather to popularize integral political solutions through more flexible single policy papers. Based on the organization’s white paper mentioned above, developing more detailed policy position papers is amongst the most important of ip’s current activities.

In October 2008, a commission for platform elaboration (“Programmkommission”) was created which is in charge of coordinating the work of several thematic working groups each of which is due to concretize, differentiate, and substantiate one of the central chapters of the white paper.[6] The policy papers to be issued by these working groups will either deal with fundamental questions or with issues of high day-to-day actuality and are scheduled to have gone through the internal revision process by summer 2010.

The members of these working groups have largely been recruited during ip’s first two nation-wide gatherings (on November 14th 2008 and Mai 9th 2009) in Bern. Through open invitations to all who consider themselves competent in the respective field, surprisingly resourceful and effective “think tanks” on integral consciousness, integral society, integral economy, integral education and integral peace policies have emerged. As an example, the working group on economics shall be briefly presented.

Economy surely is one of the areas where integral approaches have only begun to be worked out. While Kevin Bowman (IntegralLife) has recently outlined what it means to perceive economy from the four quadrants and from different stage perspectives,[7] answering the question on how these perspectives could enter a productive dialogue and what actual integral economic solutions could look like, is much less obvious. In this respect ip's starting point is, on the one hand, its integral anthropology, conceptualizing humans as potentially ever-developing beings with at least four basic needs (material-biological, emotional-affective, mental/intellectual and spiritual) and on the other hand the idea of common welfare. Generally, ip strongly pleads in favour of reintegrating the economic sphere into society as a whole.

---

[5] Hans-Peter Studer, Das Einfache wird nicht einfach sein – oder doch? Interview in: Zeitpunkt, No. 96, July/ August 2008, p. 18-19.

[6] As of today, IP has working groups on integral consciousness, integral society, integral education, integral economy and distributive justice, integral health, climate and energy, migration and integral peace politics (see the chart at the end of this article).

For that purpose, ip holds a self-organizing market economy to be indispensable which, however, has to be embedded in effective and commonly backed rules to prevent it from becoming self-sprawling. This means that not only do the so-called external, social, and ecological costs of production and consumption have to be internalized, but, even more important, that the increasingly destructive dynamics of the modern money system would also have to be tamed. "ip" therefore suggests to define limits to the maximum achievable income and revenue, combined with a guaranteed basic income, in order to establish a market economy with a high creative potential, and with revenues more equally shared by all members of society. For the same purpose, ip proposes to establish rules by which concentrated capital would be periodically reallocated in order to offer similar economic chances especially to all young people when commencing their professional careers. According to ip's economic concept, this will lead to a more locally oriented economy based on small and medium-sized companies that would both be free from the pressure of constant material growth and from the one-sided financial interests and influences of some mighty few.

In view of making this vision understandable also to those people who until now have not reflected on the principles, culture, and effects of today's economy in similar depth themselves, ip is fully aware that its vision has to be outlined and explained carefully. And of course, intermediate measures have to be defined, helping to implement the greater vision step by step. Right now, ip's working group on integral economics is in the process of discussing and substantiating its central ideas which is being experienced as a very fruitful and sometimes also controversial endeavour, since the group consists of members with rather different backgrounds: professors, economists, managers, entrepreneurs, engineers as well as people with just a general interest in integral economics and business.

It is therefore no scarcity that in one or the other working group, conflicts arise both with regard to the design of substantial policy suggestions and, for example, to integral leadership and the coordination of the groups themselves. In this respect, some of them have already experienced difficult moments of personal and relational tension. To this point, however, similar situations were always resolved though transparent dialogue, combined with careful self inquiry and communication which, as a rule, not only leads to the deepening or even renewal of the respective member's commitment to the group and its working project, but also to processes of personal and collective transformation.

The working group on integral economics, for example, has recently worked out a conflict on several fundamental issues through taking all the necessary time to carefully listen to all opinions and to actively speak with those voicing minority positions until a common understanding or even consensus was found. In this case, several advisory votes were held in the course of the discussion. In the end, a (former) representative of a minority position even agreed to write a text from the perspective of the majority argument. The principle of consent (within which an issue is discussed until no more legitimate objection is raised against a particular solution) is indeed one of the central elements of ip’s working culture.

---

[7] Kevin Bowman, Integral Economy. Part I: Our economic institutions, www.integrallife.com, November 2008.

How Does ip Operate?

As the however-scant glimpse onto ip’s working group on integral economics has shown, the modes and culture of cooperation within ip are probably as important as the substantive aspects of policy development. In fact, this is true for all of ip’s units or “holons” on all levels. With regard to ip’s internal functioning, three interrelated aspects can be distinguished: the association’s general working culture, the procedures of developing contents and the emergence of structures and mechanisms adequate to an integral organization.

Firstly, the meetings both of the core group and of any other thematic working group are not merely intellectual processes, but also integrate moments of silence and meditation, shadow work, physical exercise, and dance. Integral political culture as practiced within ip is understood as addressing all senses, turning political commitment into an experience of meaningful activity, and an expression of joy, ease and celebrating life. Rituals are used to create awareness and centring and to foster individual, as well as collective transformation. Emerging conflicts are carefully looked at and thoroughly solved. This usually happens through creating spaces of awareness allowing to bring in and to voice all aspects appearing relevant from perspectives of the people involved. These perspectives are then balanced out until some sort of consensus or consent is found providing sufficient common ground for further activities. Within ip, the president is not entitled to put his or her foot down and lay down the law in cases of conflict.

This ongoing experience strengthens the group’s collective identity, often engenders transformative processes, and sometimes leads to surprisingly creative solutions. As a result, a specific kind of integral working culture, based on a set of guiding rules, practices, attitudes and habits has evolved over the past three years. It can be described as a culture of presence and awareness, of silence and creativity, of conscious dialogue and transparent conflict resolution which continues to define and shape ip’s work.

In order to support the necessary but sometimes difficult processes of collective shadow work, several roles and bodies have been created. Besides the principle of consent (see above) and the continuous emphasis on inviting individual perceptions, objections, and feelings, one of the central roles in all of ip’s internal processes is the so-called “process observer (Prozess-beobachter).” For any working session, one of the participants is assigned the role of carefully watching how the others interact with each other and to report his impressions in the end. In case of perceived tensions, the process observer can interrupt the session and call for resentments to be resolved immediately.

In order to deal with conflicts and cases of discord that cannot be resolved through the practices described above, ip is continuously creating new bodies and mechanisms. Currently, these are an ombudsman, individual and collective supervision, working groups for mediation and for giving feedback with regard to the quality of single processes as well as of the functioning of ip's internal dynamics in general. Even though some of these new forms still have to find their ultimate shape, in their totality they probably already do provide a suitable frame for quality control, as well as for further developing ip's integral working culture.

Secondly, during the substantial process of elaborating contents, all the thematic working groups follow similar schedules and practices which also go back to the early phase of the core group's work and are now supported by one of ip's members, a specialist in organizational development. The process of content development usually starts with the creation of a common vision, for example through techniques of "presencing" (i.e., creating awareness for oneself, the group, and the subject or situation in question) and of collective intelligence (i.e., inviting solutions and letting them "appear" from collective, transrational realms of consciousness). This vision is then broken down step by step into more concrete "real utopias" before elaborating single, concrete policy suggestions and projects in yet more detail. In the end, the respective processes are always critically reflected and their results appreciated in one way or another.

A considerable challenge to the quality of ip's working culture constitutes of the organization's rapid growth during the past year. In comparison to the time when ip was officially founded, it has experienced an enormous increase in membership after participating in the *Congress for Integral Politics* in August 2008,[8] where for the first time it became visible to a larger audience. Within only 1½ years, ip grew from 20 to 326 members in May 2009. And between November 2009 and January 2010, 101 new companions joined the association, now counting 492 members (as at Feb. 18th 2010). This includes active, ideational, and sustaining members and has, by the way, been achieved solely by mouth-to-mouth propaganda, combined with strategic informational activities in like-minded contexts. More noteworthy public campaigns to make it known to a wider public have so far been strictly subordinated to a rather silent, organic growth and are envisaged by the association's leadership only after a certain number of members has been attained. If the steady growth process continues, however, it is hoped that in summer 2010, the quantitative basis will be sufficiently convincing to turn ip into a regular political party.

In order to nurture and perpetuate its working culture as the organization grows, the core group initiated a working group on internal culture, which is taking care of cultivating and fostering ip‘s basic rules and principles and of developing them further. Also, members are increasingly offered training and enhancement, both to experience and internalize ip's culture and to promote their own self-development.

---

[8] The first Congress for Integral Politics took place in St. Arbogast/Austria from August 3rd to 10th 2008. It attracted over 100 participants from Germany, Austria and Switzerland and was completely sold out. During a whole week, five plenary lectures, dozens of workshops and other activities, from music to dance and project development, helped to shape an integral political spirit, which is supposed to be perpetuated in future follow-up conferences. For more information see: www.integrale-politik.org.

Holacracy avant la letter

Finally, ip's growth also constitutes a challenge with regard to its internal structures and organizational development. While for the first two years ip's activities were still quite easy to coordinate due to the limited number of 20 participants plus some well manageable working groups, its steady increase in membership has created the necessity of dynamically emerging new bodies and structures. Firstly, in order to disburden the board members, a permanent office was established in January 2008. It is run by a part-time worker and takes care of the day-to-day administrative business. Secondly, the newly arriving members had and continually have to be integrated, organized, and cross-linked on regional and local levels. Thus, in the period of a few months, regional groups emerged in Basel, Bern, St. Gallen, Glarus, Lausanne, Luzern and Zurich – with more to come – and large nation-wide gatherings are now held twice a year. This shows that ip is now also increasingly represented in the French speaking part of Switzerland.

Furthermore, new working groups and commissions continue to appear in view of the various emerging tasks and challenges. Besides the already mentioned bodies (such as the core group, the board and the commissions for platform editing and integral education/culture), the most recent creations are commissions for organizational development, public relations, finance and for coordinating regional activities. Also working groups on party formation, feedback and for mediation are about to be formed. Besides that, ip is currently inviting appropriate personalities to join the association's patronage and advisory board (see the organizational chart at the end of this article).

As a result, a rather differentiated structure has evolved which ip is thoughtfully and persistently optimizing in an ongoing process of feedback and reflection. In many respects, this structure and its underlying practices therefore correspond to holacratic principles as proposed by pioneers of integral organization like Gerard Endenburg, Brian Robertson, and others,[9] even though these were not explicitly known to ip's members when they started their project in the first place. In the meantime however, holacracy has become a much-debated issue inside the commission for organizational development and might soon be adopted as an overall aim and guiding principle by ip's board. This concerns both organizational development and the quality of working processes. On the one hand, dynamic growth is invited, although it is carefully channelled and framed to ensure ip's overall substantial and structural coherence without any other general control being exercised from above. On the other hand, holacratic principles and practices such as the equal value of all participants' perspectives, the shifting of roles and competences, and the continuous observation, reflection and evaluation of ongoing processes have been in place since the beginning.

In particular, organic holacratic development is permanently reflected and facilitated by the commission for organizational development, while the future feedback group is supposed to look after eventual disruptions of the integral flow, for example by monitoring implicit and explicit conflicts and by promoting their careful, constructive and transparent solution in order to avoid new collective shadows from emerging. As indicated above, one of the reasons why careful self-reflection and shadow work are central to ip's working culture on all levels is that the experience of unresolved problems with communication and personal as well as collective shadows inhibiting effective political work were among the main motivations to establish and organize ip the way it was in the first place. Meanwhile, the qualities acquired in the course of three years of integral politicising as described here seem to be part of ip's "Unique Selling Proposition" and one of the main sources of ip's success and attractiveness within the Swiss cultural creative sphere.

---

[9] For a more detailed introduction please consult http://soziokratie.org and www.holacracy.org.

Of Whom Does "ip" Consist?

How can ip's membership be described and characterized? Although no systematic sociological data have been gathered until now with regard to the personal, professional, and motivational background of ip's supporters, we can give an intuitive analysis based on more or less long-term and intimate knowledge of the organization. From this perspective, ip's members, activists, and supporters are a colourful mixture of people from different age groups and various social and professional backgrounds. Most of them, however, can certainly be attributed to what Paul H. Ray and Ruth Anderson call the "cultural creative" sector of society.[10]

The age span of ip members reaches from about 25 to 85. About half of its members are women. ip's members are part of all social strata. Their professional backgrounds are quite heterogeneous, reaching from managers, professors and artists to farmers, craftsmen, and housewives and housemen. Many of them have an intellectual background and/or work in the fields of education, therapy, ecology, communication or health and quite a few are self employed.

With regard to the "upper left" characteristics, ip's supporters are generally rather conscious of cultural- as well as self-development, most have been following their own personal and spiritual growth paths from traditional through rational, critical to post-rational and integral levels for many years. Also, the individual portraits of the members of the core group, for example, show that the majority have already gone through major transformational experiences in their lives.[11]

Among ip's members and supporters' community, there are people with long-term experience in social and political work and ones who preferred not to get involved with the traditional political business – that is, until they discovered ip. Since this organization is perceived and experienced as being different both in terms of its contents and its practices and behaviour, it functions as an umbrella for the cultural creative sector which until now has probably been under-represented politically and in some sense lacked an appropriate vehicle.

Moreover, ip gives its adherents the possibility not only to gather with likeminded people, but also to experience the joy of experimentation, collective creativeness and intelligence and of the transformational and sometimes even healing effect of an integral dealing with conflicts. In so doing, it offers chances for meaningful activity, allows for the emergence of common creative projects of multiple kinds and helps to give the growing integrally-minded community a visible face and a clear-cut voice.

---

[11] See http://www.integrale-politik.ch/d/index.php?option=com_content&task= view&id=34&Itemid=48

To what extent ip will be able to maintain its character or will to have to adapt to more traditional practices once it actually enters the day-to-day political business, is an open question. For the moment at least, most of ip's followers are basically interested in serving their common task as an expression of their spirituality rather than in making a career within the organization. But when the development of the association reaches the point where it will become a political party, qualified members will have to step forward as candidates for political duties, first on a local and cantonal, later also on a national level. In contrast to most other politicians, however, they might not do so with the intent of being re-elected, but to bring new impulses into society by using the available political vessels.

Why in Switzerland?

To our knowledge, Switzerland is the first country to see a party appear based on an integral worldview and explicitly calling itself integral, while elsewhere in Europe, either no efforts have been made in this direction or similar efforts have lead to different results. In Germany, for example, which has a rather old and therefore differentiated integral community, part of which had organized itself under the roof of the "Integral Forum" about ten years ago, no integral political force has emerged thus far. The political party which probably comes closest to ip was founded in 2001 and calls itself "the violets – for spiritual politics" ("Die Violetten – Partei für spirituelle Politik"[12]). The "violets" have meanwhile taken part in several regional elections in Germany, as well as the elections to the European parliament and the Bundestag in 2009, where they received 48,000 (EP) and 32,078 (BT) votes respectively. However, even though the party cooperates with ip, for example in 2008 while organizing the Congress for Integral Politics, it has so far neither adopted an integral theoretical basis nor developed an internal "lower left" working culture comparable to ip's.

In contrast, France, another big neighbour of Switzerland, lacks a comparable integral community but has seen the foundation of "La France en action" (*France in action*), which seems to be the political force most similar to ip.[13] It was founded as a party in 2004 and received over 265.000 votes in the European parliamentary elections in that same year. However, even though like ip, it aims at bridging the traditional left-right cleavages, the programmatic outlook of "La France en action" is primarily humanistic and ecological, with its main emphasis on ecology and biodiversity.

While ip does keep a loose relationship with "the violets" and other groups in Germany, there are, for the time being, no formal contacts with groups in France. Since earlier attempts to launch transnational and European initiatives had failed (see earlier section), ip has chosen to focus its resources and energy primarily on its own country in order to take root within Swiss politics and society before engaging in more ambitious partnerships again.

---

[12] See: www.die-violetten.de.

[13] See: http://www.lafranceenaction.com/index.php.

It will be interesting to see how ip will take its place within the Swiss political landscape and develop relations with the existing political parties and relevant actors in Switzerland. In view of successfully launching integral political projects, it will certainly be helpful that the Swiss political system is a direct democracy and traditionally based on the principle of concordance, i.e., structurally integrating all political parties represented in parliament into the decision-making processes and all major parties into the government itself, the so-called Bundesrat (see http://de.wikipedia.org/wiki/Konkordanzdemokratie).

This means, first and foremost, that the highest political power is with the citizens themselves. They not only have the right to elect the members of the two houses of parliament, but also to cast their ballot on (changes of) laws, as well as of the constitution itself and, more so, to take initiatives in order to try and insert new political ideas into the constitution. A second important characteristic of political life in Switzerland is that even the strongest political party or parties can never dominate all the other forces but have to cooperate with them in a way that also respects the position and interests of the minorities in order to reach sustainable political majorities.

In other words, the Swiss political system itself in some sense already resembles a “holocratic structure” or at least incorporates quite a few holocratic principles. Above all, the tradition of concordance, giving individual (ideas) and small parties a much bigger chance to be heard by the main political forces and thus, to play their part in the political concert than in many other countries. This is further supported for example by the lack of a five-percent rule, by important positions being subject to direct elections, and by even seemingly small initiatives having a genuine chance to launch constitutional amendments. All of these factors are likely to make it easier for ip to bring new ideas into political discourse, as well as to gradually promote a wholly new political culture.

Another reason why Switzerland might be a fruitful ground for new political ideas is the fact that the country has always tried to stay independent and to pursue its own way. Furthermore, it is the richest country in the world. Therefore, an understanding that even more material growth will probably not lead to a higher quality of life and level of personal happiness but will rather cause more social and ecological problems might be stronger here than in other parts of the world. Finally, the high standard of living along with a good educational system and a well functioning infrastructure offers favourable preconditions to search for the new, more sustainable and more sensible way of social and economic development, which, as ip is convinced, a growing number of people are longing for.

ip
integrale politik

At this point, it is premature to report about what differences an integral frame of reference really makes on a larger scale, since ip is not communicating substantially with “conventional” political parties so far. However, its general emphasis on a-perspectivity, on “as well as” in stead of “either-or” and on evaluating without (ad)judging implies appraising other parties’ positions for what they are rather than competing with them. It implies a new way of politicizing, of going up to meet other parties without engaging in aggressiveness or role-playing – and thus, a new culture of policy- and decision-making.

The starting shot of this challenging endeavour has recently been time-phased to September 18th 2010. On this day, ip plans to announce its official foundation as a political party with an integral ceremony of handing over its integral political vision to the Swiss people. The ceremony is to be held on the Bundesplatz (Federal Square) in Bern, just in front of the Swiss Parliament, and next to the central government buildings of the Swiss Federation and of those of the mighty National Bank, in other words in the heart of the country's capital.

For an audio-visual impression of ip's culture of self-presentation, see the Swissgerman-French video clip:

Editorial

Welcome to the 10th regular issue of *Integral Review*! It was five years ago that we launched IR with our first issue and since then we have navigated our way to where we are now. Our journey has been full of learning and pleasant surprises. We have met many interesting people and gathered colleagues with whom we thoroughly enjoy working. As we continue to grow we look forward to seeing the range and quality of discourse published in IR expand even further.

Part of this process is reflected in the focus this year on special issues. A great deal of time and energy has gone into creating these special issues and we are very pleased with the results of this effort. Our first special issue, *Toward Development of Politics and the Political,* edited by IR Associate Editor Sara Ross with Thomas Jordan, has been very well received. This brought a number of new authors to IR's audience which is always a pleasure. In addition to the positive feedback we have gotten on it, we have also seen a significant increase in traffic to our website after its launch.

Very soon (by mid July) we will publish IR's second special issue, *Developing Perspectives for Advancing Metatheory and Theory,* edited by IR Editorial Board members Steve Wallis and Mark Edwards. This promises to be a rich collection of articles helping to set out some of the issues in this emerging field. Later this year or early next we will see our third special issue, *Research Across Boundaries – Advances in Theory-building*, edited by Markus Molz and Mark Edwards. This special issue will be comprised primarily of articles developed for the symposium on *Research Across Boundaries* (http://dica-lab.org/rab/). As soon as I am finished writing this editorial I will begin driving to Luxembourg to participate in this event attended by many IR contributors.

The other major event on the summer horizon is of course the Integral Theory conference, hosted by John F. Kennedy University and the Integral Institute. In addition to IR associate editors making individual presentations and participating in panels hosted by others, this year they bring their collective presence to a conference panel hosted by IR. It is entitled *Integral Discourse: Challenges and Lessons Learned from Publishing Integral Review.* Our aim is to foster face to face dialogue with conference participants on the whole range of issues related to creating high quality academic and praxis-related discourse to support the growth of the field. We invite any of you who will be there to come and join us in an in-depth sharing and inquiry on this topic.

In this Issue

With that I move now to making some brief comments on the contents of this issue. In our last issue we had a robust set of responses to Stein and Heikkinen's article on *Models, Metrics, and Measurement in Developmental Psychology,* which was published in IR's June 2009 issue. We also had an article by Sofia Kjellström, *The Ethics of Promoting and Assigning Adult Developmental Exercises: A Critical Analysis of the Immunity to Change Process,* that has now

SOME RIGHTS RESERVED

drawn responses and a rejoinder. We see this kind of dialogue as a sign of the maturation of IR as a forum for lively public discourse. We also have a response to a book review in this issue.

In response to Kjellström's article, David Zeitler has written *Coaching Ethics and Immunity to Change: A Response to Kjellström*. David is a recent graduate of Kegan and Lahey's first coaching certification program and draws on his knowledge of this work to challenge a number of the criticisms that Kjellström raised in her article. He emphasizes that the ITC program is both a structure and a process and depends, like such things, on how one uses it. In particular Zeitler focuses on issues of behavior, her conclusions regarding the ethical aspects of using the ITC process in educational settings, methodological issues and how she uses developmental dynamics.

Zeitler's thorough response to Kjellström is followed directly by a rejoinder from her. In *Responsibility and Ethics in the Use and Advocacy of Developmental Exercises: Response to Zeitler and Reams*, she engages (primarily) Zeitler's critique of the perspectives and issues she framed in her original article. She advocates for the continuation of systematic inquiry into the core issues of ethics and most significantly, whether the process actually works.

In addition to these two pieces on the topic of the Immunity to Change process and related issues, I have written a brief *Response to Kjellström* as well. Given that I began this thread with my overview and report for the field on Kegan and Lahey's book in our June 2009 issue and that I continue to learn through my ongoing use of the process, I thought it appropriate to share a few issues that her article raised for me. I discuss issues of degree of disclosure, difficulties experienced by participants, informed consent, and demands on the facilitator. We hope to continue this lively discussion in future issues.

Next we have *Creating Dynamic Development and Harmony in the Classroom* by Nick Drummond and Joan Berland. This article is the result of years of development and testing of educational practices by both authors. It is exciting to read how deep understandings about the evolving nature of consciousness can be brought to bear on elementary school classroom students. The set of tools Nick and Joan have developed elegantly allow integral principles to have very practical impacts on students' ability to learn and grow. The stories they tell of classroom transformations bear witness to the power of the interventions they have developed.

Tom Murray, with Terri O'Fallon, provides us with *A Perspective on Kesler's Integral Polarity Practice*. This article describes Tom's experience of John Kesler's work that has integrated Genpo Roshi's Big Mind process with Susann Cook-Greuter's developmental sequence and polarity work. Tom shows how the process that can engender state experiences intended to lead to both horizontal and vertical growth.

I am also contributing *Bringing Integral to Management Consulting: An Interview with Rick Strycker* to this issue of IR. Rick has brought the integral framework to his corporate work at JMJ consulting. In this interview he describes the path that brought him to this position and some of the challenges and successes he has had along the way.

IR editorial board member Roland Benedikter presents us with our first German language article in a few issues, *Weltanschauung und Politik in den heutigen USA. Barack Obama und der „neue Kulturkampf“ um die Führung der anglo-amerikanischen Weltmacht*. The brief English language summary indicates that this is an analysis of the current relationship between politics, culture and worldviews in the US as they play out in the era of Barak Obama’s presidency. This battle of worldviews is seen as the level of strategy and work being done by political parties today and it becomes critical to understand the nature of the issues involved.

A within-the-issue dialogue takes place around the book *The Tao of Liberation: Exploring the Ecology of Transformation*. IR editorial board Steven Wallis provides a review of the book, and takes both appreciative and critical stances toward it, which gives us a thorough insight into his perspectives on it. One of the book’s authors, Mark Hathaway, provides a *Response to Wallis* that aims to engage in clarifying and reframing some of the points that Wallis makes. We are glad to see this kind of dialogue in the pages of IR.

Finally, Susan Belford offers *Locking Down the South Bronx,* an analysis of interior and exterior dimensions of many of the structures and systems that prove to be forces to reckon with in not only the South Bronx she highlights, but also urban ghettos more broadly. This analysis was written as a mid-term graduate course paper, and gives us a special opportunity to express our interest in receiving articles from students who aim their work to meet requirements such as IR’s.

I now need to get my suitcase in the car and head out on the road! We hope that you enjoy the contents of this issue of *Integral Review* and look forward to meeting and hearing from many of you over the summer.

Sincerely,

JReams

Coaching Ethics and Immunity to Change: A Response to Kjellström

David Zeitler[1]

Abstract: The *Immunity to Change* coaching process has risen in popularity since creators Robert Kegan and Lisa Lahey published their second book using this method, *Immunity to Change: How to Overcome it and Unlock the Potential for Yourself and Your Organization* (2009). Sofia Kjellström (2009) recently published an article taking a critical perspective on the ethics of using ITC in educational and vocational contexts. I argue herein that when used properly, the ITC process avoids most of the criticisms that Kjellström brings to bear on this issue. Furthermore, it is argued that private life and public life (Freud's "love and work") are already inextricably intertwined, and methods like ITC give employers and employees the tools needed to navigate what are often highly charged issues, that we might increase our quality of life and increase our efficiency. Finally, the article summarizes the relationship between Subject/Object Theory and ITC, while also addressing the issue of developmental transformations in the coaching process.

Keywords: Business consulting, coaching ethics, coaching methods, developmental level, executive coaching, higher education, Immunity to Change.

Introduction

In the outstanding "rockumentary" *Pink Floyd: Live at Pompeii*, director Adrian Maben asks front-man Roger Waters if the dramatic increase in their use of synthesizers is bad for the future of music. Does this introduction of new technology into music mean that it is somehow easier to make…is the equipment, in fact, making the music? Maben captured the Floyd at their finest moment – recording their seminal *Dark Side of the Moon* at Abbey Road studios. In addition to some of the most sublime rock music ever recorded, the album includes an early version of the kind of music that would explode two decades later, "electronica." Not only, then, is *Dark Side of the Moon* one of the greatest rock albums of all time, it also portended a new musical genre. It was while recording one of these "synthesizer" songs (*On the Run*) that Maben asked his question. Surrounded by his technical equipment, the ever sharp Waters wastes no time in responding: "It's like saying give a man a Les Paul guitar and he becomes Eric Clapton, and of course *that's not true*; give a man an amplifier and a synthesizer and he doesn't become... *whoever*; he doesn't become *us*."

The *Immunity to Change Program* (ITC) is like the synthesizers and band in the above example. ITC is both a *structure* and a *process*. This dynamic is true of any musical instrument and individual (or group) using those instruments. Alone, the instrument (structure) may look good, but it is only when played (process) that you can make music. Synthesizers, however, are not *one* instrument but an electronic representation of *many instruments*. With them, musicians have enjoyed a new freedom to isolate or merge different sounds like never before. A new world opened up for them. And this is what the ITC processes provide for coaches and consultants: the opportunity to use several instruments in order to assist people who would like nothing more than to make positive changes in their lives (or, their organizations). But not everyone can be Eric Clapton.

Sofia Kjellström (2009) makes a few good points in her critique of ITC, particularly in terms of *how* ITC *can* be used. She appreciates the power of ITC, and has specific criticisms regarding both the structure and processes of ITC. I will be addressing four general areas in Kjellström's paper: her focus on behavior; her conclusions on the ethics of *generalizing* the value of ITC (between psychological capacities and between public and private life); *methodology* issues; and her use of *developmental dynamics*.

Before diving into my analysis, I would like to be as transparent as possible. I have been studying and teaching developmental psychology for almost fifteen years, and my interests and focus have always been on Subject/Object Theory. Additionally, I am currently in training to be certified as an *Immunity to Change* coach. I have been using the ITC mapping process since 2004, generally during workshops that are part of an overall seminar. My motivations for writing this response paper stem mainly from the fact that I have witnessed many trainers and teachers use the ITC method with wildly varying levels of success. I respond here to Kjellström's article because I want to begin a conversation about application-value that I hope will extend beyond ITC and into the larger coaching industry. We stand at a precipice – in a few years, all forms of "coaching" will likely be subject to licensing and other forms of oversight. Those of us who enter into the dialogue now will be much better poised to adapt to the coming changes. With any application, there is the value of the "expert" (here, the coach), the value of the "tool" (here, ITC), and the value of the "process" (here, coach-coachee relationship). As per Integral Theory, all three must rate highly in order for any effort to be considered valuable (Wilber, Patten, Leonard & Morelli, 2008). Here is a summary of my response to Kjellström, which I will unpack below. Kjellström's focus on behavior as both the *source and aim* of ITC is fundamentally flawed. Behavior is one of several components important to the work. Kjellström also makes several arguments about the plausibility of generalizing the value of ITC to business contexts based on her experience in using it as a course assignment; this comparison is not easily supportable. Additionally, her methodology was flawed (to her credit, she acknowledges this may be the reason that she received mixed results). Finally, there are specific dynamics of development, and dynamics of ITC, that Kjellström does not take into account which, when taken into consideration, address most of her criticisms of ITC (Kjellström, 2009, p. 122-127).

Kjellström organizes her discussion into the following three general areas:

- The role and competence of the facilitator.
- The expectations and capabilities of the participants.
- The mental demands and assumptions of the process.

(Kjellström, 2009, p. 116)

The following is my summary of her main points, which I will address herein:

- ITC *requires a level* (*Self-Authoring-Mind*) that is beyond most people.
- ITC assumes that *change is always beneficial* to all people.
- ITC may be *inappropriate for use at the graduate level* (or equivalent).
- Participants should be able to *enter and leave the process at-will*, without fear of reprisal.
- Consent must be *continually renewed* throughout the program.
- Complexities of mind are *not used to screen* for optimal value to participants.
- Critical *evaluation of transformational exercises* is essential for ethical issues.
- A more ethical approach is to allow the *determination* to change to arise from individuals.

(Kjellström, 2009, pp. 129-130)

On Behavior

In their books *How the Way We Talk Can Change the Way We Work* (2000) and *Immunity to Change* (2009), Robert Kegan and Lisa Lahey make it clear that merely addressing *behavior* is rarely the most optimal or sustainable way to assist someone (or an organization) looking to make lasting change. In fact, they make every effort to point out that "…if they can make the changes they need by …creating some plan to extinguish certain behaviors and amplifying others…then by all means that is exactly what they should do" (2009, p. 38). Throughout these books, they reinforce the fact that addressing *behavioral* change is complementary to their intention, which is to address the underlying *immunities* that people enact. Behaviors are *symptoms* of these underlying immunities. These countervailing behaviors are identified by the individuals (and teams) themselves, and are not exogenously identified.[2]

At several points in her critique, Kjellström incorrectly identifies *behavioral* change as the major goal of the ITC method: "The [ITC] methodology addresses two questions: why changing human behavior is so difficult, and why achieving desired behavioral changes does not happen as often as we would prefer" (2009, p. 117); "The ITC process has two parts…the second [of which] is a series of exercises designed to create change in behaviors" (2009, p. 118). There are also places where Kjellström juxtaposes behaviors and values as components of ITC, but values are incorrectly characterized as the motivation for the true goal of behavioral change: "[Competing commitments] serve as a new explanation of why certain behaviors are not performed, since persons hold values that are in contradiction to and in competition with the other" (2009, p. 119). ITC is indeed concerned with behavioral change; but it is *equally* concerned with *qualitative* change in one's interior dimensions. The fact that exterior behaviors *also* change is important, but this view alone misrepresents the full spectrum of value offered by ITC.

---

[2] I follow Kjellström here in her use of the biology terms *exogenous* as an external influence, and *endogenous* as something that arises from within the individual.

On Methodology Issues

One of the difficulties I had with Kjellström's critique was that there are many places where the sophisticated and nuanced presentation of ITC as I have come to know it is reduced to its surface features. This can be seen in her highlighting of behavioral change without the necessary addition of the interior changes that parallel these behavioral changes; it can also be seen in the fact that Kjellström occupied a dual-role (she was the leader of the class, as well as the coach for the class; this is a problem, because leaders are encouraged to do the process alongside of their employees, or in this case, students); finally, Kjellström never discusses the iterative nature of the ITC process (i.e., this is not a linear process; it is more like a chaotic-attractor, where each iteration of a map or test helps clarify one's big assumption, the essence of ITC work). I can still make out the surface features in her critique, but the iterative nature (the deeper structures *within* the structure, and the processes *within* the process) do not appear to have been taken into account.

This tendency to approach ITC using only its surface features is a thread that runs through Kjellström's method and critique. Additionally, she leaves out some important changes made to the ITC processes between 2000 and 2009, despite a cursory recognition that "…there are substantial elaborations" and additional items "…to support and extend the process" (2009, p. 119). In fact, beyond the original two structures/processes (a Map, and running a test), there are *five* additional structures/processes (listed below in bold), and several *iterations* of each of the seven main components, not including any new Maps that may arise (or if the client is interested in pursuing them):

1. Immunity to Change Map (an X-ray of one's psychological immune system)
2. Personal & Professional Surveys (a "720 degree" approach to relevant feedback; Kegan & Lahey, 2009, p. 65)
3. Immunity Map Biographies (life-history structured around the Immunity Map)
4. Continuum of Progress (a "visionary statement" of desired goals for thoughts, feelings, & behaviors)
5. Self-Observation (a process of moment-to-moment noticing, structured on the Immunity Map)
6. Running Tests (safe, modest, actionable (i.e., near-future), objective-research-stance tests)
7. Consolidating the Learning (the integration of unconscious "release" with "new assumptions")

(Kegan & Lahey, 2009)

In other words, the ITC process as it now stands is a far more thorough and integrative procedure. Like the synthesizer Pink Floyd used to make their music, there are many, simultaneously moving parts. On the surface the procedure is linear; but in practice, like many things in life, it is anything but linear. We must allow ourselves to meet reality where it is, and not where our maps *indicate* it should be. Kjellström does not mention this crucial distinction, a theme woven throughout the ITC literature.

There are several methodological issues that I have with Kjellström's research. For starters, she believes that the first step in the ITC process is to "…*uncover* the commitments to change" (my emphasis; 2009, p. 118). This is not a correct characterization of ITC. The first step in the process has always been to gradually step-back from the things that *we say we want*, so that we can *look at them*.[3] This step is similar to the kind of thing that individuals do when creating a five year plan, or when business organizations create a *SWOT* template (strengths, weaknesses, opportunities, and threats). This process, as a "natural" occurrence, may or may not involve the "reality-testing" needed for "uncovering," as Kjellström puts it. What *is* something that requires "uncovering" are the assumptions behind the ways that we stifle our own achievement (more on this important distinction later).

Kjellström does not explain the "modifications" (2009, p. 120) that she made to the ITC process, nor what she specifically means when she critiques some of her students' "barely acceptable" ITC maps (p. 121). She does, however, give us several clues as to what some of these modifications were; this includes requiring that students share their experiences with one another (p. 121); having students create their own tests (p. 121); requiring that students include early childhood experiences when generating their biography (p. 121); and making the "admission of vulnerability" (p. 121) necessarily a part of ITC. Kjellström also used two vastly different pedagogical formats for delivering ITC, an online version and a campus version. Finally, the ITC process was obligatory. Each of the above methodological issues bears directly upon the level of success that one is likely to achieve when delivering this content, as I will explain below.

Kjellström admits that as the facilitator, the following issues "may have" (2009, p. 122) affected her research: reasons/intentions for ITC use were withheld; success/failure not held as natural results of the process; hopes/benefits for results not shared; the outcomes were grade dependent (rather than goal success). (p. 121)

Kjellström makes cursory acknowledgment that a key issue of participant control over *how much they share* is indeed a part of the ITC format, yet does not take this into account in her methods or analysis of her own results. In fact, she mentions this "requirement" to share as a reason why she ceased to make ITC processes a course requirement. My response to this is twofold: 1) Kegan and Lahey are clear that individual participant sharing should properly be a voluntary activity (though this can be a complex issue when used in a business context; more on that point below); 2) depending upon the type of graduate class, the ITC process may not be ideal for learning *about* ITC or Subject/Object Theory.[4]

---

[3] In an excellent yet sadly obscure article, Robert Kegan and Gil Noam speak specifically to this issue of "uncovering" vs. "developing." They explicitly state that there is an important difference between uncovering to reveal something that is present yet inaccessible, and the "gradually corrected forms of self-other confusion" (1989, p. 422). This is the essence of moving subject to object, a differentiation that allows for the interior (psychological) and exterior (behavioral) change that only together can be called "adaptive."

[4] For example, a group-process course or effective-communications course may be appropriate, but a course on theory may be inappropriate; however, because Kjellström describes only the students' programs and not the courses in use, there is no way to determine whether this was a skillful application of ITC.

In fact, ITC advises users that sharing is voluntary. The advice is to work in groups of two and in small groups thereafter, where sharing is always voluntary (Kegan & Lahey, 2009, pp. 65-67). This has been part of their program, quite literally, from the beginning of their first ITC publication:

> Ground Rule for you as Speaker: How much or how little you want to let your partner (or partners) in on during these reflections is continuously *up to you and you alone*. This includes, should you need to elect it, the perfectly acceptable and respectable choice to remain completely silent throughout, keeping all your thoughts to yourself. (Kegan & Lahey, 2000, p. 14, emphasis in original)

Kjellström not only made the ITC process a required assignment, she also required sharing (on campus) and built "sharing" into the fabric of the online course (their experiences were written for all to see). Several students were understandably against this, and refused to share. There are other "ground rules" as well, such as avoiding any *positional power difference* between partners, and the crucial element of leaders doing the ITC work right alongside their employees/students (Kegan & Lahey, 2009, pp. 80-81). Kjellström is asking of her students that they share with her despite her power differential, and it is at best unclear if she did or did not engage in the process alongside her students. These are additional methodological issues that must be taken into consideration when looking at her results.[5]

Additionally, Kjellström had students creating their own tests for the big assumptions that they hold. This is something that is to be done in conjunction with a coach or, in the case of a course assignment, their professor. It was only *after* the students' test results began to reveal how little the tests engaged their assumptions or fears that Kjellström questioned the validity of the process. Yet, changing the "column two" *behaviors,* the "test" that many of her students ended up doing, is not a valid test in ITC. The tests must be designed to increase the participants' awareness and attention of their big assumption – to begin to take it as object, that the person can no longer "be had" by it (Kegan, 1994, p. 32).

It seems to me that Kjellström is criticizing her own version of *Immunity to Change*, and not the total offering of Kegan & Lahey.

On Generalizing the Value of Immunity to Change

Kjellström laments the fact that she could find no outcome studies on ITC. This is inaccurate, as there have been three books, and several articles and book chapters, all of which have (or are) thorough case studies on the outcomes of ITC (Kegan & Lahey, 2000; Kegan & Lahey, 2001; Bowe, et. al., 2003; Wagner, et. al., 2005; Helsing, et. al., 2008; Kegan & Lahey, 2009). Kjellström cites the very references I have just listed before mentioning the lack of outcome studies. Yet Kegan & Lahey have always maintained that a successful outcome is when individuals (or organizations) are *better able to meet their own stated goals*. That is the benchmark by which success is determined, not factors of developmental complexity, though the two are often related (Kegan &Lahey, 2009, pp. 80-84, 87-124). The reason that the successful attainment of goals and developmental complexity are so often related is because of the "balance" between public and private life. Most people living in a country that has the infrastructure and economy to support a middle-class must contend with leaders that will often place them *in over their heads* (Kegan, 1994).

---

[5] I am indebted to Deb Helsing for these helpful perspectives on power and process.

Forcing change is not the goal of ITC; nor is alleviating the anxiety and depression that results from the arrested development that can happen when consistently being *in over one's head*. The goal of ITC is to *meet people and organizations where they are right now*, developmentally or otherwise. This idea of meeting people where they are in terms of their development, while providing the supports and challenges necessary for continued growth, is best captured in Kegan's notion of bridge-building (1994, pp. 42-45; 278-279). There, Kegan teases apart the nuanced orientation that is required of parents, educators, and leaders interested in development. According to decades of research, many of us are being asked to construct the world in a way that is beyond our capacity. There exists a large gap between the claims being placed on us, and our capacity to meet those claims; ITC effectively addresses the suffering that occurs when we are in over our heads. (Kegan, 1994, pp. 42-45; 278-279)

A key issue in Kjellström's critique has to do with the question of responsibility for those in power, be they senior executives or professors. How much responsibility is on the shoulders of the individual, and how much is on the organization, with respect to the communication of trust and safety in the disclosure of information (particularly information that might jeopardize their employment or their grade)? This is indeed an important issue. Kjellström asks a question that is imperative for all coaches and facilitators: "…do teachers [or coaches and consultants] have sufficient psychological training to support the students [or clients] adequately?" (2009, p. 123).

Steven Berglas asks the same question in his article, *The Very Real Dangers of Executive Coaching*. He surmises that the single worst thing that coaches and consultants do is to *see outward behavior as reflective of inward change*. As I have already shown, when used correctly ITC is a hedge against this danger. This stems from its foundations in Subject/Object Theory. The ITC process is exquisitely designed to help people look at the assumptions that they once unknowingly used to look at the world. In other words, the big-assumptions that are revealed during the process are a small part of an overall system of mind. We live in and through these systems of mind, and they inform our meaning-making. Each level of mind represents a more complex and nuanced capacity to distinguish ourselves from the world around us. In the ITC process, an excellent testing phase would see the coach skillfully assisting someone as they *safely distinguished themselves from their assumptions*.

Table 1. Levels of Development in *Immunity to Change*
(adapted from Kegan & Lahey, 2009)

Stage	System of Mind
Stage 5	Self-Transforming Mind
Stage 4	Self-Authoring Mind

Stage 3	Socialized Mind
Stage 2	Instrumental Mind

Which brings me back to how ITC, when done properly, is a hedge against the danger of confusing behavior alone for interior transformation. This is particularly important when considering the shift from *Socialized-Mind* to *Self-Authoring-Mind*. Kegan has always maintained that individuals who construct their world through the lens of social-norms, who locate principles and values outside of themselves as the measure of meaning, are prone to alter behavior when in the presence of a leader. Furthermore, in the absence of such leadership, they can have a difficult time maintaining the meanings behind those behaviors. Berglas' argument is that any coaching program that focuses on exogenous sources of meaning will be neither optimal nor sustainable. (2002, p. 90)

ITC, by grounding the process in someone's professional or personal goals, denies attempts to construct meaning outside of oneself without neglecting the support that the person needs. In other words, ITC avoids the two main pitfalls that Kjellström and Berglas raise of working with people who construct reality according to the *Socialized-Mind*. It *meets* clients where they are, and it *engenders* the construction of meanings at the person's "leading edge of development" (Wilber, 2000a, p. 52, 158). This is also one of the reasons why Kegan & Lahey always recommend that every person in a group engage in their own ITC process before engaging it as a group. It is clear that coaches and consultants who use psychologically structured processes like ITC should fare better than those who do not. What I mean by this is that coaches who do not attend to or otherwise circumvent the actions of those who might manipulate them (or simply not fully engage them) will be spending energy without achieving desired results. This is another area where I am in general agreement with Kjellström. Berglas also comes to this conclusion, and furthermore recommends that executives be psychologically screened for proper preparation; unfortunately, he does not provide any idea of what this might look like. (Berglas, 2002, p. 89-92)

Finally, there is a larger question that Kjellström puts to the ITC community that no coaching or consulting process should be asked to shoulder by themselves: to what extent should individuals in a business context be encouraged to share ("coercion," as Kjellström puts it; 2009, p. 123)? I have already summarized Kegan & Lahey's position on this matter. However, I would like to add some reflections on the issue. There are certain realities of working for an organization that must be reckoned with.

Most people that are employed by an organization are employed "at will." In other words, they have the freedom to choose their employer. But their paycheck is contingent upon the successful completion of their organizations' goals. Every stakeholder in an organization is under pressure to complete goals, and the specter that another person can both do my job *and share during a professional development training* can be a powerful *endogenous* motivator. Kjellström claims that this is a form of organizational coercion. Yet I wonder if the motivation is solely *exogenous*, which would indeed be coercion. If I know that there are other people willing to do my job, including the sharing that I do not wish to do, then I may feel a motivation to share that is all my own. Is this coercion, or the healthy expression of at-will employment and individual freedom? I am not as willing as Kjellström to make any quick decisions on an issue that clearly belongs in a larger dialogue on social values and employment.

ITC should not be singled out for what is in fact a systemic issue: where is "privacy" in the postmodern world? Privacy is increasingly becoming an issue in our ever-connected world, where every cell phone has a camera, and our collective appetite for voyeurism seems to be growing. Even with such a charged issue, ITC may offer us some wisdom. Rather than shy away from the implications of this future, Kegan & Lahey take it head on: "…anxiety is the most important…private emotion in public life" (p. 48). After all, "public work" has already infiltrated "private life," as any visit to a restaurant or coffee shop will make clear! The constant interruption of our privacy with work has already happened. This is no one-way street – as Deb Helsing puts it, "…our hidden commitments, big assumptions, and difficult emotions are *already* in the professional world – showing up as dysfunctional work/leadership!" (personal communication, 2010). It seems only fair (or natural) that our public work begin to integrate the very real concerns of our private hopes, fears, and dreams. This possibility could take sterile notions like "morale" and "corporate culture," and turn them into actual shared agreements.

A larger point is that leaders of organizations who themselves show developmental transformation from one level to the next tend to show more successful (and more ethical) leadership. The life work of Bill Torbert (2004, pp. 104 – 120) has shown that developmental transformation to what he calls the "Strategist" and "Magician" (the two stages in his model that correspond with Kegan's *Self-Transforming-Mind*) can be of great benefit to all employees in a learning organization. He is worth quoting at length here on this issue of later stage development and leadership ethics:

> …leadership is a process that is *noncoercive*, multidirectional, influence-oriented, real, and mutual… [This] is very close to the concept of transformational leadership practiced by late stage managers…Later stage leaders are apt to lead organizations, direct projects and take on issues which reverberate across many horizons. Therefore, when they err, their negative impact may be far greater than whatever temporary, local waves an earlier stage leader's actions have. Late-stage leaders are working with major archetypes of awareness and thus with the 'symbolic resonance' of actions, not just with the details or outcomes of specific behaviors. Since the resulting effects are symbolic, meanings and interpretations are made by individuals surrounding the leader. However, such interpretations are likely to be limited, for two reasons. First, if developmental theory is right, the complex and subtle judgments and actions of very late stage leaders are undecodable by earlier stage participants. (my emphasis; Lichtenstein, Smith, & Torbert, 1995, pp. 103-105)

As Ken Wilber has pointed out, every level has both *dignities and disasters* (1995), a theme that also runs through Torbert's work. What Kegan & Lahey add to these considerations is the fact that when all members of an organization work with their *eyes wide open*, the private anxieties that are often painful can assist with the public lives that we must lead. There is always individual risk when embarking upon a group effort, but we cannot deny that this larger issue of privacy in public life is one with which we must reckon. ITC provides a safe, measurable, ethically grounded way to do so. The possibility that ITC might actually be ethically beneficial for all involved is never suggested in Kjellström's critique, but seems plausible given the preliminary evidence in the ITC case studies that have been published, and the studies by Torbert on leadership and organizational transformation (Rooke & Torbert, 1998).

The Developmental Dynamics of Coaching

The central issue that Kjellström takes, developmentally speaking, is that the ITC program goes over the heads of most people who will be engaging the process. Kjellström cites two sources for this: the first is from the meta-analysis that Kegan & Lahey report in their book *Immunity to Change*, which shows that 58% of people will not be at the level of *Self-Authoring Mind* (p. 28). The second is from a study by John Manners, Kevin Durkin, and Andrew Nesdale (2004), which looked at the hypothesis that stage transformation can be promoted.

The first important distinction I will make is that Kjellström tends to fuse *conflict* with *disequilibrium*. While it is true that disequilibrium can involve conflict, from a developmental perspective disequilibrium also opens the possibility of beneficial change into wider perspectives. As Kegan is fond of saying, if you can help someone to understand a more complex perspective, they will prefer it (1982, pp. 56-57). Kjellström minimizes the potent effect of genuine leadership within such a dynamic: "With a supportive facilitator, some people will be helped [to] perform tasks at the systemic [i.e., formal] stage" (2009, p. 129). In fact, the effect is far greater than Kjellström acknowledges. Furthermore, the disequilibrium is "conflict" for the *old self that is being disidentified from,* but "repudiation" for the *new self that is performing the disidentification*. This is a developmental nuance of Subject-Object Theory that is not represented in Kjellström's analysis.

Kjellström also states that development can occur without disequilibrium: "…there are interventions that promote development without being designed to be structurally disequilibrating" (2009, p. 123). Here, she refers to the Manners, et. al., study on the promotion of stage development. The position that stage transformation can occur without disequilibrium represents a fundamental misunderstanding of developmental dynamics, and in fact, the study that Kjellström cites actually claims the opposite: "The effect of the program was greatest among those for whom the intervention was *most disequilibrating* in relation to their existing ego structures" (p. 25) and there were *minimal to no* changes for the control group "…because for them the program was *not* structured to be disequilibrating" (p. 21).

An interesting aspect of the Manners, et. al., study that bear upon ITC is that the researchers identified three key ingredients for promoting stage development, ingredients that the *Immunity to Change Program* contains:

1. Must be personally salient (e.g., investment through personal/organizational goals)
2. Must be emotionally engaging (e.g., the direct engagement of anxiety and hope for overcoming ones' anxiety)
3. Must include an interpersonal dynamic (e.g., working with an *Immunity to Change* certified coach)

(Manners, et. al., 2004, p. 25)

This brings me to the most disturbing charge that Kjellström weighs against the ITC process, that it is going over the heads of 58% of any group that uses it.[6] Were this true, it would represent, at best, a cruel irony for Kegan who wrote a book on avoiding this very dynamic. However, my analysis below of ITC and Subject-Object Theory shows us that this charge cannot be supported.

Firstly, 40% of a typical group is between *Socialized-Mind* and *Self-Authoring-Mind* (Kegan & Lahey, 2009, p. 28). This means that even in the worst case scenario (58% - 40% = 18%), 18% of any group is the highest number that *might* miss the more nuanced aspects of ITC. However, there is every reason to believe that this is not the case. When used correctly, ITC "meets" individuals who are either at *Socialized-Mind* or in between *Socialized-Mind* and *Self-Authoring-Mind* extremely well (see below). The other 18% can be divided into the roughly 10% who are limited to *Socialized-Mind*, and the 8% who are pre-*Socialized-Mind* (Kegan & Lahey, 2009, p. 28). Following Kegan & Lahey's lead, I will call this prior level *Instrumental-Mind*, for it represents a level of development where people see the world through their own needs, and see others as *instruments* or tools to achieve the satisfaction of the need. They have great difficulty coordinating their needs with the needs of another (or a group), which is the hallmark of *Socialized-Mind*.

The question of whether people at this level are merely developmentally arrested, or are pathologically sociopathic, or if those are two sides of the same coin, is one that I do not have the room to address herein (see Kegan, 1994, pp. 38-44; see also Bubiak & Hare, 2007). Nevertheless, it is worth noting that regardless of etiology, there are individuals who are limited in their capacities to coordinate personal needs with group needs. It is worth noting here that not every adult who is exhibiting *Instrumental Mind* will be psychologically unhealthy or *pathologically manipulative*.[7] Berglas (2002) claims that executive coaching is at best *inert* when confronted with such people, and at worst, can actually assist the psychologically unhealthy people who are at this level with enacting their unsavory schemes.[8] ITC has built-in defenses against such manipulation, as it both identifies a personal *need* that someone has in the form of their own goals, and then calls the person into a group process where personal goals *and group goals are being coordinated* by a coach or consultant in conjunction with group members. In other words, ITC does not go "over the heads" of individuals at the *Socialized-Mind*. Furthermore, there is every reason to believe that even at *Instrumental-Mind*, individuals can be helped to look at needs rather than *be* them (in a way that is one-half step beyond what they can self-generate). Those are precisely the conditions for optimal development that Kegan and other developmentalists have outlined (see for example Loevinger, 1976).

---

[6] 58% is the figure that Kegan & Lahey give for the percentage of people who, according to developmental research, have yet to develop into the level of *Self-Authoring-Mind*. This figure is made up of 40% of people who are in between *Socialized-Mind* and *Self-Authoring-Mind*, and 10% of people who are at *Socialized-Mind*, and 8% of people who are below this, at *Instrumental-Mind*. (Kegan & Lahey, 2009, p. 28)

[7] Rather, it might be better to say that "manipulative" is an unnecessarily pejorative term; from the perspective of *Instrumental Mind*, my manipulation of others is no different from manipulating clay to make ceramic objects. Like most psychological conditions, sociopathy lies on a continuum, with degrees of impact on others.

[8] Paul Babiak and Robert Hare (2007) have published a book on the havoc that these individuals can have in a business organization. Their 10% estimate on the number of people who reflect these characteristics of *Instrumental-Mind* is in general agreement with Kegan & Lahey's meta-analysis, and with other developmental researchers (Cook-Greuter, 1999).

As noted above, even with *Instrumental-Mind*, individuals are likely “held” by the ITC processes. So those individuals at *Instrumental-Mind* may only get from the process that their goals may or may not line up with the goals of their team or their organization. Individuals at the level of *Socialized-Mind*, however, will certainly possess the capacity for self-generating the constructions necessary for ITC processes. Kjellström’s criticism here is that

> The exercise is built on the requirement that all participants are able to use, at minimum, formal stage thinking…because the persons need to see themselves responsible for the commitment [and] an adequate understanding of personal responsibility is a formal stage concept which requires formal stage reasoning. (2009, p. 127)

Again, I must disagree with Kjellström on the grounds that her argument does not rest on solid developmental theory. Full formal-operational cognition is the foundation for *Self-Authoring-Mind*; however, Kjellström is incorrect that full formal-operational cognition is required for engaging in ITC. In fact, individuals with *early* formal cognition, which is the foundation for *Socialized-Mind*, can readily self-generate the meaning-constructions that are called upon for ITC. Seeing oneself as responsible for one’s commitments, and holding up your own end of an agreement – these are *precisely* the sort of qualities that emerge with transformation to *Socialized-Mind*. As I have pointed out, even with *Instrumental-Mind*, a maxim of developmental psychology is that when someone can be helped to understand a perspective that is one-half step beyond that which they can self-generate, they will generally prefer it. This means that when it is used skillfully, ITC can avoid the potential pitfalls of dealing with *Instrumental-Mind*, and even holds the possibility of assisting those individuals with their continued development. Finally, individuals who are at or just beyond *Socialized-Mind* already have the necessary endogenous complexity of mind to benefit from ITC.

Conclusions

Near the end of her article, Kjellström uses the ITC Map itself to evaluate ITC processes. In particular, her elucidation of columns three and four do not reflect a particularly good way of creating an ITC map. In her column two, Kjellström lists the designs and explanations of ITC as “inadequate,” and the column three competing commitment is listed as “to not admit weaknesses in ITC” (2009, p. 128). She was perhaps being a bit tongue-in-cheek; however, column three is properly a competing commitment that, through reverse-engineering, is revealed as the source of the column two behaviors. In other words, neither column two nor column three would satisfy the basic requirements for a good ITC map.[9] Column four, which she lists as an assumption that “…more mental complexity is always right and good” (2009, p. 128), is both an incorrect analysis of Kegan & Lahey’s intentions, and an incorrect use of the ITC process. The column four big assumption is supposed to be something so feared, that to even consider it creates what cognitive-behaviorists call *catastrophic thinking*. It is this assumption that fuels the entire immunity map.

---

[9] A “good” ITC map is one where the column one goals are true for you; the column two behaviors are things you yourself are doing to get in your own way; the column three competing commitments feel like they have a lot of gravity and help explain the column two behaviors; and the column four big assumption is a source of catastrophic thinking – even the thought of it brings anxiety.

Kegan & Lahey do not believe that more complexity is always right and good, which should be clear from the fact that in their first book on ITC, *no developmental language is used*. It is also clear from the way that Kegan ends his book *In Over Our Heads* – with a reminder that whenever we *predetermine how* someone should grow, or the *point* of that growth, we lose something. We lose the passion of life that makes life worth living, the fragile passion that promises new life (and, in a business context, even new products and services). Passion is its own reward (1994, p. 354).[10]

They are equally clear that that healthy, supportive change is good, and that many people are in over their heads, whether they like it or not. This rift between what we can developmentally accomplish and what we are expected to accomplish is crying out for a system that can soothe the endogenous force of evolution, with the exogenous claims being placed upon people. The *Immunity to Change* process was born of the recognition that this rift exists, and its purpose is to assist those individuals who find a similar need in either their private or public lives.

I agree with Kjellström completely on the issue of ethics. ITC coaches can and should make the claim that although the *general* structures and processes of ITC are available to anyone interested in pursuing lifelong change, the help of skilled practitioners is crucial when considering questions of ethics and quality alike. Like the synthesizer that Roger Waters was using during his interview, the ITC program is a simple instrument, with complex possibilities. When used skillfully, it *meets people where they are* in terms of their level of development. When used skillfully it has been shown to be *highly beneficial for assisting people (and organizations) meet their own stated goals*. When used skillfully, it can be a *powerful tool for personal and organizational transformation*. Wilber claims that the single greatest achievement that humanity can make at this time – something that would move our species a long way towards solving the many global crises that our species currently faces – would be to assist the 40% of us who are poised to transform into *Self-Authoring-Mind* (2000b, p. 56, 88, 104, & 126; 2006, pp. 179-182). Following Heifetz, Kegan & Lahey call this the sort of *adaptive change* that can meet the *adaptive challenges* that our species is facing (2009, p. 29). I believe that ITC coaching has an innovative design, with the unique characteristics to help us meet the adaptive challenges that our species is grappling with.

---

[10] Is the main purpose of ITC to help someone transform from one level to the next? My answer to this is a qualified "yes." You see, Kegan & Lahey (and anyone who is skillfully using ITC) are first and foremost interested in those areas where someone feels stuck. From the beginning of Subject/Object Theory, the goal has been to assist people with their own ongoing evolution. A good analogy is that of the new field of *epigenetics*. Epigenetics is a field that sees not a static set of building blocks encased in a nucleus, but an ongoing process of exchange and incorporation between the environment and the organism. ITC coaching is not trying to get people to grow; ITC coaching is trying to assist people who are already embroiled in the process of their own becoming. Subject/Object Theory tells us that we are never "static" in our development, it is always happening. But we *can and will often* get stuck. In the lumber industry, log jams are broken up when divers plunge into a river and search for the one log that started it all – the "key-log." By removing this key-log, the natural flow of the river can continue, and so can the logs. The logs and the river are granted their own distinctness, yet maintain their relationship with one another (i.e., the logs are not removed to solve the problem, nor is the river diverted). That is what ITC coaching is about – helping people find their key-logs, in the form of their big-assumptions, to free up the trapped energy that is causing them pain *and* stifling their development.

Life is messy. One of my favorite quotes from the eminent Jane Loevinger is that “Nature does not promise us an orthogonal universe, a world arranged in rows and columns, where every distinguishable trait is statistically independent of all others” (1976, p. 176). When properly used, the ITC process is not about an artificial arrangement of rows and columns, it is a Map that helps practitioners sift through the messiness of life, that we might understand the underlying patterns. Because life is nonlinear and messy, I understand why a system that is as elegant as *Immunity to Change*, with the layers of depth and scalability that it has, can be seen for its surface or deep features (hopefully, for both, as both are necessary). I hope that my response can be seen from the spirit of spirited dialogue; at the same time, I feel a responsibility to highlight what I see as the significant offering that ITC has for the world in this time of crisis.

The elegance of the *Immunity to Change* process makes it appear simple. In some ways this is true – creating an initial ITC Map can take as little as one hour. The full ITC process, however, is a much richer endeavor. When David Bowie was interviewed for a documentary on the evolution of rock music during the 1970’s, he chuckled at the relationship between engineers and musicians. Engineers, in Bowie’s estimation, were trying their best to recreate the sound of individual instruments through synthesizers; musicians, on the other hand, cared little for the engineer’s vision, and wanted to create *new* sounds with the synthesizers. If they wanted a horn, they would play a horn, not an electronic representation of one. But if they wanted a future-sound, the sound of waveforms mingling together, they needed a synthesizer. Being an *Immunity to Change* coach is like being a musician in this sense – the beautiful music comes not from the repetition of scales, but from the iterative flow of harmonic resonance.

Responsibility and Ethics in the Use and Advocacy of Developmental Exercises: Response to Zeitler and Reams

Sofia Kjellström[1]

In this response I circumscribe the nature and scale of the rejoinder to refocus on the ethical and theoretical implications of utilizing developmental exercises, of which *Immunity to Change* (ITC) is seen as an example. I welcome Zeitler's and Reams' continuation of the ethical discussion, and I want to reclaim and develop some of the delicate points and consequences that were described in my original article. The line of reasoning is based upon the presupposition that developmental methods and techniques are used in the real world with people and consultants with limitations and strengths, in conditions that are neither optimal nor perfect. Among all theoretical and ethical questions, I found the most profound issue to be: does it work?

Reflections upon Methodology as a Means for Improved Ethics

One overarching argument is that my use of a "flawed methodology" invalidates the critique I am making of the ITC process, reducing my observations to "criticizing her own version of *Immunity to Change*, and not the total offering of Kegan & Lahey" (Zeitler, 2010, p. 8), leading to his conclusion that, if the process is 'properly' employed, it avoids most of the criticism. Some of my adaptations were less than optimal, as Zeitler and Reams note, but I think most ethical implications and theoretical issues in the article can be generalized beyond a single case. The aim of the article was to illustrate significant theoretical and ethical implications that arose in the interplay among (a) the role and competence of the facilitator, (b) expectations and capabilities of the participants, and (c) the mental demands and assumptions of the process, and these implications were generalized beyond my particular performance. Consequently, the theoretical critique can be valid regardless of how I implemented the process.

My point in sharing the methodological modifications and shortcomings were to illustrate how the process could be used and adapted to an educational setting, and by sharing this experience, create a space for learning and reflection. Attentive readers could use this space to contemplate their own experiences of participation, of leading others, and the ethical issues that

SOME RIGHTS RESERVED

arise in those situations. My presentation, therefore, was designed to be as transparent and as succinct as possible. A concise account does not imply an incomplete or inadequate understanding.

For example, one of my ethical points in the article addressed the delicacy of voluntarism in participating and sharing. I used examples from my experience to draw out ethical implications. As I describe in depth in the article, this dimension of participation—the students' rights to exercise personal discretion and protect confidentiality—was something I discussed at length with my students, including sharing Kegan's ground rules (Kjellström, 2006; Kjellström, 2009, p. 120). Despite my awareness of these dimensions, my efforts to inform them, and my explicit statements on these matters, some persons nevertheless felt uncomfortable. The point is that the voluntariness of participation and sharing is a relevant topic each time you are in the context of having tasks to be performed in a course or attending a workshop. Some people will do things that they should not have done outside of that context. Ethical awareness and acknowledgement is the first step of handling it.

Another main point is the topic about positional power issues between teacher and students, as Zeitler and Reams also discuss. ITC ground rules state that employees should not share their personal immunity change issues with their leaders. In the educational settings the teacher is the coach and leader, as Zeitler points out. But again this can be used to raise more general points. Even in a business setting where a coach takes on a group, the coach is both a coach and a leader. As soon as a person is put in the centre as an authority figure, in this case a psychological authority, he or she turns into a leader and an asymmetry of power arises. Not even a skilled practitioner will avoid or escape the possibility to be seen as a leader.

Thinking and Behavior

Zeitler argues that I incorrectly focus on behaviors as the source and aim of ITC.[2] It is possible to interpret it that way, but this was not my intention. One of the main points with both ITC and adult development theory is the focus on people's different ways of meaning making and complexity of mind. But the way a person sees the world also has significant effects on how he or she acts. Kegan and partners use this rhetoric to argue for the value of the exercise. Since behavioral change is difficult and does not happen as often as we might like, ITC could be used to stimulate change, since ITC focuses on the underlying meaning making. But the argument does not end here. Internal thinking does affect behavior – an important point: what is the point of changing internal thinking if it never leads to changes in actions? In my opinion, for ITC to have a real function in society, it is not enough for it to change peoples' thoughts; new thoughts must lead to better actions. But how do we know whether ITC leads to better thinking *and* better actions?

---

[2] Zeitler points out that I use the word values in juxtaposition with behaviors. I have rather used commitments and values as synonyms. Commitments can be interpreted as things that are valued as important. In Swedish language the translation of commitment is an awkward term not very often used in ordinary language. The students were all taking classes on ethics, therefore the use of values was seen as an adequate choice. This translation was communicated and discussed with the students (Kjellström, 2006). No teaching of adult development theory was included in the courses, to answer another question by Zeitler.

The Need for Scientific Studies to Show That It Works

According to Zeitler "Kjellström laments the fact that she could find no outcome studies on ITC. This is inaccurate, as there have been three books, and several articles and book chapters, all of which have (or are) thorough case studies on the outcomes of ITC" (Zeitler, 2010, p. 8). I was not "sad" (i.e., I did not "lament") that I was unable to find such studies; I was surprised by the absence of independent and scientific outcomes studies given the attention and strong advocacy that ITC was enjoying in the general literature. That Zeitler classifies case studies as examples of outcome studies leads me to conclude that Zeitler's definition of an "outcome study" differs in significant ways from mine. Or perhaps it is a difference in my preference for independent assessments, that is, studies performed by persons with no financial interest in the process, which raises another ethical question—conflict of interest.

In the article, I emphasize the need for critical studies that address possible inadequacies or tests of effectiveness (Kjellström, 2009). There is a need for critical texts that openly discuss weaknesses in the structure and/or process of ITC, which is what prompted me to write of my experiences. Most previous written works that Zeitler interprets as support for successful outcomes have coauthors that have financial interests in promoting the ITP process and certifying new coaches; by definition, these financial considerations negate the independence of the view or critical voice on the ITP. Some people might argue that this is an important part of the difference between "marketing research" which is motivated by a desire to determine how best to sell the product, and scientific research, which should be done independently. I further argue here that there is indisputably a paucity of tests for effectiveness and outcomes, and that is what is needed to persuasively demonstrate that ITC is an effective process. Effective outcome studies

> … demonstrate that a treatment works; it moves the field forward by revealing what interventions are helpful within a given treatment; and it provides data to move beyond emotional allegiances into rational selections of treatment. (Najavits, 2003, pp. 317-318)

Case studies are not outcomes studies as Zeitler suggests. To illustrate the kind of scientific work and research that is needed for establishing that the ITC works, I quote at length the three stages of research needed in the development of a therapy, and how different outcome studies could be designed (Rounsaville, Carroll, & Onken, 2001):

> *Stage 1—Early Therapy Development*. In this stage, the focus is on careful development of the treatment and basic scientific testing. A treatment is conceptualized, repeatedly refined by trying it with patients, and pilot tested. The pilot test may be a simple pre-post design, or may include a control condition. The usual products of this stage are a treatment manual, an adherence scale and training plan for therapists, relevant assessment instruments, and the results of the pilot test, which can provide such information as the effect size to use in the next stage. Stage 1 is sometimes conceptualized as two stages, 1-A and 1-B, where the former is focused solely on treatment development (e.g., developing the manual and associated materials), and the latter focused on pilot data. Stage 1 typically takes from 2–3 years.

> *Stage 2—Efficacy Testing.* In this stage, the goal is to determine whether the treatment works under the best possible conditions; that is, with intensive training, supervision, careful selection of appropriate patients, and in-depth assessment. The study design is usually a randomized, controlled study to rigorously test the treatment, comparing it to either no-treatment, treatment-as-usual in the community, or an existing alternative treatment with known efficacy (e.g., in the field of addictions, comparing a new treatment to 12-step drug counseling). The usual products of this stage are the results of the randomized controlled trial, as well as more refined treatment materials than at stage 1 (e.g., adequate psychometric properties of the adherence scale and other treatment- specific measures, descriptive data on the patient and therapist samples, a final version of the treatment manual, and some type of “dismantling” test linking the theory and techniques of the treatment to outcomes). This stage usually takes 2–4 years.
>
> *Stage 3—Effectiveness.* Also known as “generalizability” or “transferability,” the goal in this stage is to evaluate how well a treatment performs in real-world conditions, rather than the highly controlled study of stage 2. Thus, the treatment might be implemented in a community setting with minimal training and supervision, and applied to a broad range of patients. The typical products of this stage are outcome data collected from the effectiveness study (which may involve multiple clinical sites), specification of dissemination strategies and their feasibility, and data on therapist outcomes. This stage typically takes 2–3 years. (Najavits, 2003, pp. 319-320)

Implementing these three stages in outcome studies of ITC has barely begun and has stalled on the first stage. The ITC has been tried out as case studies but there are no scientific tests with pre/post designs. Case studies can be used in the first stage to test out hypotheses, but even that has not been done in a systematic manner with the ITC process. To really establish the value of ITC, we must proceed to stage two. In addition to the criteria mentioned, a longitudinal design is recommended. It would be very interesting to examine whether the performance of ITC helps people transform and to more generally assess what happens to them that can be persuasively linked to their experience with ITC. How do people of different orders of mind or phases of development perceive the process? And is it possible to show that changes in life are due to the process, and not to other personal circumstances? For which kinds of individuals, with what kinds of problems, with what kinds of support is the ITC efficient and effective? One main reason for conducting sound studies is that they can build the foundation for a more ethical, respectful and developmentally aware usage of the ITC process.

The Need for Genuine Developmental and Ethical Options

One of the main advocacy points in my article is to expand the responsibility to include organizations and individuals. If a leader is in over his or her head, it is not solely a problem for the individual to handle, nor is it a fact to accept, but it is also the result of bad recruitment by an organization. For example, take a formal-stage-thinking person who does not live up to the requirements of a systematic-stage job description. A more ethical way to handle such a situation would be to give the following (hypothetical script) options/information.

> We have this process (e.g., ITC); several studies have suggested that the process can allow formal thinkers a chance to develop the skill of systematic thinking, which is the requirement for performing adequately in your current job position. We know from these studies that only 24% of those who commit to the process are able to make this transformation. You should also be aware that the process is emotionally intense, and if you decide to take this path, you will have a better chance of success if you have good support from your family and friends. Making this change could be arduous, but we will support you on this journey. If you do not have the support or are not prepared to go through this emotional challenge, then we have this second proposal for you. We will help you to find a new job position which is better suited to your current way of functioning, and we will support you in that process as well.

This ethical management is currently difficult to achieve since there are no scientific (outcome) studies or systematic evaluations to consult. The example is also based upon the assumption that the employer has the knowledge and competence in adult development and the ability to apply understandings of the level of complexity both in organizational positions and in people. The change and development of organizations needs to be carried out by individuals. In order to achieve change, the individual has to experience change as meaningful, which means that changes need to be set up in a wider context where the individuals subjectively experience these induced changes as meaningful.

I end by repeating my concern about the lack of an integrated ethics component in the ITC process. Zeitler states that the benchmark is that “individuals (and organizations) are *better able to meet their own stated goals*” (Zeitler, 2010, p. 8). To me this is an insufficient criterion for a successful process. First, it is highly subjective, even if it is judged in the affirmative by the person, partner, and co-worker; arguing that “it is good, only because we have decided it to be good” is inadequate and needs to be supplemented by other criteria. Secondly, there are no explicit ethics built into the ITC process. As a developmental exercise, ITC invokes the implicit assumption that usage results in better thinking and actions, and consequentially to improved ethical action. But by using this criterion for success, there is an open possibility that the method will be used in business as a means to pursue conventional goals of higher productivity and financial gains. This is a limited use of a process that claims to overcome the immunity to change so that people can realize higher levels of their potential

Responsibility as a Mental Demand of the ITC process

The idea that the ITC process goes over the heads of some of the users is a challenging one. I use the issue of responsibility to expand, deepen and illustrate this point even further by (a) demonstrating the developmental character of responsibility and (b) examining what kinds of responsibilities are required by the ITC process.

The Developmental Nature of Responsibility

Research shows an empirical basis for a developmental sequence in reasoning about responsibility issues.[3] Research on the attribution of responsibility for negative events (e.g., illness) shows a specific pattern of assigning responsibility, from mere association to the importance of the knowledge and intentions of the agent (Fishbein & Ajzen, 1973; Mantler, Schellenberg, & Page, 2003). Adult development studies show that considerations about responsibility issues evolve in people in three different ways. Firstly, several studies independently discovered that talk about individual responsibility arises spontaneously in different domains at a certain level and only after that is individual and social responsibility discussed in combination (Dawson & Gabrielian, 2003; Gilligan, 1982; Kajanne & Pirttila-Backman, 1999; Kjellström, 2005; Kjellström & Ross, 2009; Robbins & Greenwald, 1994). Secondly, people have different abilities to comprehend and take responsibility due to different interpretations of themselves, others, and the world (Gallagher, 1988; Kegan, 1982, 1994, 2003; Loevinger & Blasi, 1976; Rybash & Roodin, 1989). People see themselves as responsible for different things (e.g., thoughts, roles, emotions, and actions) depending on their demonstrated level of development (Kegan, 1994) and the sphere of things for which they are able to take responsibility increases in later stages of development. For example, nurses who were at later stages of development (measured by Loevinger's ego development) scored significantly higher on a personal responsibility measure, where personal responsibility was defined as the ability to attribute the causes of their behavior to personal choice rather than to the situation or dispositional actions (Gallagher, 1988). Nurses at earlier stages ascribed more of their behaviors to external factors than to internal ones. Internal factors are recognized at more complex levels of development through reflection (Fischer & Pruyne, 2003). Thirdly, the term "responsibility" means different things to different people depending on their stage of development. Using concepts like causes, personal performance, and duties to define the core meaning given to "responsibility" does not occur until the abstract reasoning stage (Dawson, Xie, & Wilson, 2003). Once that concept is developed, it can be built upon. For example, the compound concept of *personal responsibility* is at the next stage, formally operationalized in Piagetian terms (Dawson & Gabrielian, 2003). *Responsibility* has different meanings at different stages of development – what the content is within a stage differs as well as across stages.

The Demand of Responsibility in the ITC Process

Having established the developmental nature in the ways people perceive responsibility and are able to act responsibly, the essential questions are: what kinds of responsibilities are required in the ITC process, and what are the mental demands?

In the first version and description of the ITC process, step number two in filling in the table is framed in terms of personal responsibility (Kegan & Laskow Lahey, 2001). To use the terminology "personal responsibility" implies a level of formal operational in Piagetian terms (Dawson & Gabrielian, 2003).[4] The task to complete in step two is to give an account of what s/he is or is not doing in order to live up to the first commitment, which the authors describe as moving from blaming others to describing their own inadequacies. To ascribe decisions and actions to personal choice options rather than to projecting to others and situational factors indicates a developmental level of approximately the conscientious stage of ego development (Gallagher, 1988; Loevinger & Blasi, 1976). Kegan and Lahey describe the second step in the following way:

---

[3] This paragraph is a slightly modified version of a passage in the article by Kjellström & Ross (2009).

[4] In the article I discussed the possibility that to do the ITC table could require systematic stage capacity to put formal relationships together (Kjellström, 2009, p. 127, pp. 129-130). A correction to Zeitler's

> …we invite the room to be filled up with the language of responsibility, declarations of or unproductive actions and inaction.[…] We tell stories so we can stop *being* our stories and become persons who *have* these stories. We tell stories so that we can become more responsible for them. (Kegan & Laskow Lahey, 2001, p. 37).

Using Kegan's theory, I interpret this as an ability of self-authoring persons, or persons who are aware of the authorship of their lives. Kegan has discussed the issue of responsibility extensively in his books, particularly in *In Over Our Heads* (Kegan, 1994), and he gives several examples of what kinds of responsibilities are possible with each order of mind. "The third order of [socialized] mind is both capable of, and subject to socialization. It is not able to reflect critically on that into which it is being socialized. It is responsive to socialization not responsible for it" (Kegan, 1994, p. 288).

With a socialized mind a person is able to take responsibility within a given role and show loyalty to an organization. But in order to take responsibility for your life or your story of your life a self-authoring mind is needed.

Zeitler argues that a person at the socialized-mind stage is able to see and take responsibility *for* a commitment, which is questionable. In order to be responsible for a commitment, the person needs to have it as an object. It presupposes an ability to take a critical stance relative to the commitment. An illustration of this stance can be found in the definition of a personal commitment on Wikipedia "Distinction is often made between commitment as a member of an organization (such as a sporting team, a religion, or as an employee), and a personal commitment, which is often a pledge or promise to one's self for personal growth." (Wikipedia, commitment, personal commitment, June 1, 2010). It is the second version to which ITC primarily refers, according to my interpretation. "Seeing oneself as responsible for one's commitments, and holding up your own end of an agreement – these are *precisely* the sort of qualities that emerge with transformation to *Socialized-Mind"* (Zeitler, 2010, p 14). I propose that it is possible to hold up one's end of an agreement and be responsible *to* a commitment, but not to be responsible *for* it in the sense of being responsible for yourself for your commitments. Interesting to note, Zeitler at the end concludes that "I feel a responsibility to highlight what I see as the significant offering that ITC has for the world in this time of crisis" (Zeitler, 2010, p. 16). In other words, his job or duty is to highlight the beneficial contributions. I would suggest that feeling a responsibility to highlight both positive and negative features of ITC to be a more balanced option to pursue.

---

argument is to accurately attribute the quoted text (page 14 in Zeitler and page 127 in the original). Only the first part of Zeitler's quote belongs to me and, it is unclear what is being referred to in the second part by "systemic stage," but systematic is the label used for the stage after formal in the Model of Hierarchical Complexity (Commons, 2008).

If my interpretations are adequate and valid, I suggest that the ITC process itself includes elements that presuppose a self-authoring mind. Zeitler suggests that the process could be adapted to people in earlier stages, but I think it is an open question if their needs are best met with this process or some other. Since we have different opinions on the mental demands of the process, I suggest that we need some better assessments of the types and levels of demands respondents experience so we can adjust our practices on the basis of evidence rather than opinion. What I think is clear is the importance of acknowledging the mental demands of the ITC process as one basis on which to compare alternative processes and available therapies/techniques that aim to help and transform people's ways of thinking and acting, but this kind of comparison is only possible once we have adequate assessments across the range of options.

There is no point in elaborating with numbers of how many do or don't manage the process sufficiently, since that would require studies of how different people and groups handle the process, and no such numbers are available. My personal experience (which I shared with Kegan (Kegan & Laskow Lahey, 2009) and others (BusinessDigest, 2009) is that some people struggle with the process. The reason they struggle is probably a combination of where people are (e.g., developmentally, emotionally, motivationally, phase in life, genetically), skillfulness of coach (e.g., developmental awareness, coaching experience, time, interpersonal skills), and the structure and process of the ITC (its developmental demands, instructions, etc.).

Conclusion

There are a lot of important ethical questions regarding the usage of developmental exercises; for example, voluntary participation and sharing, informed consent process, power asymmetries, boundaries for privacy and public life, leader competence and skills, conflict of interests, built-in ethics, and individual goals as compared to organizational goals. One of the overarching issues is: How can we create a society that is designed to allow individuals to develop their full potential and that has a place for all kinds of people at all "levels" of development? The thesis of Kegan's work is that lots of individuals are "in over their heads" in the modern society, that the demands put on them are more advanced than what they can perform. The inferences Kegan, Lahey, and Zeitler make seem to be that we must help individuals to develop a self-authoring or self-transforming mind. There is also an assertion that the ITC as a developmental exercise has the potential to create the needed transformation in people. But there is an indisputable lack of rigorous scientific studies that show the effectiveness of the ITC and similar exercises. Is it ethically justifiable to work with life-changing exercises without a convincing evaluation literature that shows "success rates"? Consider being asked to choose a physical or medical treatment. Patients must be informed of the potential benefits and risks, the advantages and the disadvantages, the possibility of adverse reactions, the probability of success, and the rigors/demands of the various options. The most fundamental ethical question when promoting and assigning adult developmental exercises is to know that they work, for whom, and under what circumstances. And there are scientific methods to determine this information. In the absence of such studies, maintaining a certain level of skepticism seems the prudent position.

Response to Kjellström

Jonathan Reams[1]

In *The Ethics of Promoting and Assigning Adult Developmental Exercises: A Critical Analysis of the Immunity to Change Process,* Sofia Kjellström has broadened the discourse around Kegan and Lahey's (2009) Immunity to Change (ITC) process with her critical examination of issues related to this work. She identifies ethical concerns, facilitator capacity, informed consent and the cognitive demands of the process as areas deserving attention to enable the intentions of this work to best serve a growing community of practitioners. Reading Kjellström's article, I noticed a number of points that I want to respond to. Since my recent report from the field (Reams, 2009) I have had the opportunity to run the ITC process with three different groups, which has given me new insights into what can be sometimes implicit areas. In the future I hope to engage in a deeper analysis of a few specific areas that have caught my attention. For now, I will present some preliminary thoughts based on Kjellström's article.

My first response is of appreciation to Kjellström for opening up the space for critical discourse in this area. While I will present some views contrary to hers on some of the issues she raises, it is only due to her having raised them in the first place that I have been motivated to reflect on them. Her inquiry helps to identify what may be some implicit assumptions of the authors of the process. While neither of us can speak for Kegan or Lahey, we can present opinions drawn from their writings and our experience.

I will begin at the beginning, at least in terms of how one begins the ITC process. In describing how she introduced the ITC process to participants, Kjellström "emphasized that they should not disclose more than they felt comfortable sharing" (p. 120). I have taken a slightly different approach to this. I emphasize to participants that they will get out of it what they put into it. Thus the more they can connect with something personally meaningful, the more potential for insight the process can offer. Upon reflection, I can also see the value of including the kind of framing Kjellström describes.

Kjellström describes doing this process both over a two hour class period and though a web platform. Both of these settings raise issues for me based on my experience. I have been fortunate to have whole day classes or workshop settings to work within, and have been able to take at least four hours for the process. From these experiences, I would not want to try running the process in any less time. In running the process through a web platform, she describes how the students read two articles, listened to a lecture and then filled out the four columns according to written instructions. Based on my experiences, I cannot imagine trying to run the ITC in this manner. I have found an ongoing need to reframe and re-interpret the instructions to participants. Part of this may be due to language issues, (many of them have been Norwegian, with varying degrees of competency in English), but I believe that more of it arises from the normal

SOME RIGHTS RESERVED

differences in understanding and interpreting language constructs based on stages of development differences as well as cultural and life experience differences.

Thus when Kjellström notes that failures for the participants occurred due to either failure to complete it or refusing to do it, I cannot help but think that a good proportion of those failures could be attributed to the limitations of time and format utilized. While I have also observed the process to have less than optimal results for some participants, I would not have called them “failures.” I have also not had anyone refuse to participate.

The difficulties Kjellström identifies with participants having troubles putting appropriate content into the columns is familiar to me. I recall the first time I ran the process, one participant filled out all four columns in 15 minutes! She treated it like an action plan, and thought she had done what was asked. This kind of experience led me to guiding participants through the process by giving them one task at a time, each on a separate worksheet and only after doing three of the columns put them together on one page. This allowed me to control the focus of attention better, which I came to see as a significant issue.

The primary issue which led to my greater interest in having more control over the focus of participants’ attention was that I noticed them going down what appeared to me to be habituated tracks. One of my reflections is that this process is inherently asking people to pay attention in a direction that is not familiar or habitual. The work appears to many as being continually counter intuitive. From this, I have experienced a constant need as a facilitator to work with participants on keeping their attention focused in the intended areas.[2]

Kjellström describes difficulties for participants in articulating a personal fear or worry that could then be turned into a competing commitment. I have also seen this issue. My perception is that it can arise from two things. One is that people often tend to place more qualities than behaviors in column two. This makes it more challenging to imagine doing the opposite and getting in touch with such a fear or worry. (This is also related to the importance of landing a good first column commitment, as if this does not happen, everything that follows is more difficult to find). The other is that I have an impression that the deep seated defense mechanisms of the big assumption underlying the particular system people are inquiring into can foresee its own exposure coming so to speak, and take measures to blind a person to it. As Kegan and Lahey say, when you get to the big assumption you often encounter warning signs like “do not enter,” or “danger ahead.” It may be that these defenses begin to operate earlier, at the first hint of exposure. Thus extra guidance or facilitation could be required to help participants keep moving down the intended path.

In examining facilitators’ choices and capacities, Kjellström recognizes how the perceived failures or negative responses to the process may have been impacted by how she led the process. This leads into an examination of issues focused on the role of the facilitator. I agree that here it is important to distinguish this aspect from the impact of the process itself. Any tool is only as good as the person using it. At the same time, if one has a poor tool, even the best facilitator will be hard pressed to do a good job with it. The issue of facilitator capacity is a broad topic and time does not permit me to do more than briefly mention a list of issues I perceive as related. There is of course the issue of cognitive development, that a facilitator will only be able to work with what they can perceive and that the subtler movements of attention by participants can be hard to track. The quality of presence, or interior condition of the intervener, (to recall a key element of my earlier review of Scharmer's Theory U), is also a critical issue for facilitators and not an easy one to address. As well, the skilful means of the facilitator will be important as I have found that practice looking after specific issues related to running the process helps! Finally, how can a facilitator use all of the above to enable participants to scaffold up into a space where they can, (if such assistance is needed) at least temporarily operate at a required level of cognitive functioning to enable the successful completion of the 4 columns? All of these and more issues of facilitator capacity seem relevant to me in relation to the "success" or "failure" of participants' experience with the ITC process.

---

[2] In the future I hope to explore in depth the nature of this phenomenon from the perspective of David Bohm’s notion of thought as a system.

I agree with Kjellström that the ITC process needs to be carefully introduced or framed. She notes the importance Kegan and Lahey give to advocating for the value of the process. Enabling participants to have a good reason for engaging in the process is critical. If they feel coerced due to expectations of following authority in the form of a teacher, then it will indeed be much harder to connect to the work in the way I feel it is intended.

It is within the context of introducing and framing the ITC process that the issue of informed consent arises. Kjellström raises this as an ethical concern, that if people really knew what they were getting into then they might choose not to participate. Her view is that the "ITC process seems to be constructed on a major implicit assumption of change as always beneficial to all people" (p. 129). She thus recommends that a richer informed consent be used and that it "is determined from within the individual" (p. 129). This raises a number of related questions for me which I will explore briefly.

I think she is correct in that some might have illusions about what they are getting into, and choose against participating if they really understood what was to come. I can think of many times in my life where if I had known what was coming I might have declined to engage a certain experience. As a counterpoint to this, I could say that if participants had it all spelled out for them in advance so that they had such fully informed consent,[3] it would in some ways circumvent the process. My view is that the "surprise" elements of the ITC process simulate real life issues where we often encounter situations that stretch and challenge us and that in the end we perceive as having been good and even essential for our growth, but that we would not have engaged in if we had a choice and known, from our previous consciousness, what exactly we were getting into. This seems to me the point that Kegan and Lahey make when they say that when we enter the territory of the big assumption, we often encounter "do not go here" signs, as the defense mechanisms that protect identity from its natural evolution would by doing their job (as the competing commitments and 2nd column behaviors show) and thus keep us from ever going there. This seems to me to be the point of calling it an immune system – it has a powerful ability to detect and resist change.

---

[3] I would question even being possible as even if we give participants words about what they may experience through the ITC process, those words may not convey the depth of what they may experience, leading to them saying "you didn't tell me you meant this" with us responding "but that is what I told you when I said … ."

There is also the issue Kjellström mentions of teachers being in an authority role and having great power in choosing what curriculum students are exposed to. As a comparison, parents often take such responsibility for their children, encouraging them to try things that they feel are going to be ultimately good for them even if they don't like it at the time. My experience is that a similar process often goes on, where as a teacher I encourage students to engage in activities that from their current perspective may not be their first choice, but from my perspective as being responsible for guiding their education, are something that can serve them well. Thus I feel that while the issue of informed consent is important, it is also complex and requires real attention to how we as teachers and facilitators introduce the ITC process.

Along these lines Kjellström asks "what right does a teacher [have] to create optimal conflicts in peoples' lives?" (p. 123). While I can see how this question arises from her focus on perceived ethical concerns with the ITC process, I also have a different view of this. My experience is that change is indeed the only constant in today's world. As well, creating such "optimal conflicts" can be seen as similar to Ron Heifetz's view of leadership as creating a holding environment for people to do the adaptive work that the challenges of life bring them. So I do not feel that the creation of such situations is outside of participant's everyday life experiences. In fact, it could be seen as helping them by bringing such situations into focus so they can be reflected upon. It can also be seen as doing this in the relative safety of a somewhat controlled learning environment, where the consequences are not as direct and serious as when one might attempt to deal with such things in everyday settings. So this question could be reframed to see the creation of such situations not as a right of teachers or facilitators, but as a duty or gift to give.

In thinking about the perceived desired outcome of developmentally oriented change, Kjellström raises questions that lead her to ask "if this is "adult development" or manipulation?" (p. 126). I agree with her that as with any tool, much depends on the motivations of the facilitator and that manipulation is of course a possibility. However, my sense is that the majority of us using this work are drawn to it from motivations arising from our experience of the value of developmental work. My own view is that we cannot force or manipulate development anyway, but can merely lead people towards the opportunity and see if they take the step for themselves. As well, it appears to me that much of this work is planting seeds that we may or may not see any fruit from during our interaction with participants. In this way I do have the same concerns as Kjellström about manipulation.

Kjellström also raises the issue of how people at earlier stages of development may experience the ITC process. While I agree in part with her saying, "I do not think the solution of encouraging people to change and "develop" is either possible or an ethically-sound solution for all situations, because it will create expectations that are too challenging and over the heads for some" (p. 126), I also feel that it is possible to go too far in protecting people from growth and challenge. Life will generally bring us challenges, so working to help people find better ways to utilize these challenges by providing some support in the form of the ITC process. It is not a panacea for all issues and all people.

I do believe that the ITC process can, done with good framing, proper time and settings and appropriate facilitation, produce significant results. My most recent experience was with the second year of the Masters in Organizational Leadership course I mentioned in my report from the field last year. Applying all that had been learned from previous experience, the results were a significant improvement from last year. This was not only evident from observation, but also from reading the exam essays and course feedback. While it was clear that the depth of what was gotten from the process varied according to the reflective capacities of the students, it was also evident that each got out of the process something that was significant and appropriate for them.

There are many other points that I would like to respond to, but time has not permitted me to complete this in the depth I originally intended. I will leave the more detailed critique of Kjellström's article to David Zeitler's article in his issue. My hope is to return in a future issue to a more rigorous exploration of some of the subtler patterns of attention that I have noticed in my more recent experiences with the ITC process.

Creating Dynamic Development and Harmony in the Classroom

Nick Drummond and Joan Berland[1]

Abstract: The article describes a childhood education program for developing the individual and collective "consciousness" of a class of children. The word consciousness is used to refer to the level of an inner awareness, and responsibility being held by an individual and or group of people. The authors view consciousness as being a fundamental part of our experience, and although not easily seen, it is something that can be pointed to, described and developed. Practically, this means learning how to give attention to the "interior" as well as exterior dimension of a classroom environment and discovering how these are intrinsically connected. A set of tools are presented that can enable teachers and students to learn about this inner dimension of our experience – how to bring value and focus to it – and the effect it has on our choices and behavior. When consciousness is recognized and given importance it becomes something that can be experienced by everyone at any moment. When it is intentionally focused on and developed, an atmosphere of dramatic possibility, true discovery and infinite potential can be created in any classroom. Whenever this happens, children and adults alike are able to experience, envision and become attracted to new *and* more mature possibilities in the way they learn, teach, communicate and relate to each other.

Key Words: Awareness, childhood education, consciousness, rubrics, values, vertical development.

Introduction

There are exquisite moments in every classroom when there is a heightened sense of awareness as everyone in the room seems to become a part of the same energy. Sometimes it's quiet and deep like inward and outward breathes during a deep state of relaxation. Other times it’s loud and rambunctious. Whatever is happening feels like fun and there's an air of charged electricity in the room. Those present are aware that something out of the ordinary is happening, even if it can't totally be explained. An eight year old student in Joan's class this year described it "as if something was being created from nothing". If this can happen sometimes, how can we make it happen on a more regular basis? Is it something that can be learned or taught? Would it make the experience of school and learning more effective?

Learning can be defined in many ways: as an act, process or experience of gaining knowledge; to become informed or acquainted with; to become aware. Dynamic Development and Harmony was created in order to bring an inner and outer awareness to the learning that happens in the classroom environment beyond the academics.

The outer dimension includes becoming acquainted with how each individual exists in the classroom space. Some children seek attention by being silly, or physically sit in such a way that they appear to close themselves off if something is too hard. Others simply don’t say anything at all. Plastic water bottles are squeezed loudly or spilled on the floor. Hands are in desks and attention may be on shaving an eraser into bits or peeling the paint off the pencil. If there is no awareness on the child’s part that this is happening then they probably aren’t aware of how distracted they truly are or that there is another way to participate as a learner in school.

While many children can voice their preferences, likes, dislikes, hard and easy academic subjects, they may not be aware of the inner dialogue going in their mind throughout the school day. During a math lesson is one’s attention on their understanding of the concept being discussed or on lunch, the soccer game after school, how they feel about themselves or another student? Learning is also the process of experientially becoming connected to ourselves. What if we take it a step further and realize that the choices we make as individuals affects not just us, but everyone in the class? A sense of connecting and discovering something that is both “new” and meaningful can transpire. We are only just beginning to become aware of this kind of learning and that the more we give it attention and value it the more we will learn about it.

A Utopian Class

What would we start valuing? What kind of choices would everyone start making? What if you found yourself teaching children not only math, reading and writing, but doing something as unbelievable and audacious as learning how to direct the future trajectory of human cultural development? What if this potential was so creative and positive you could never know in advance what new potentials would emerge from the process or the people participating? What if this became a new potential in education? What if this potential was so profound that our ability to tackle global challenges rested upon it?

Working With Consciousness

The kind of learning we describe is very much based on recognizing the role consciousness plays in education. We define consciousness as the level of inner awareness, presence, inclusiveness and responsibility being held by an individual and or group of people. We view consciousness as always being a primary part of our experience, and although not easily seen or widely recognized, it is something that can be pointed to, described and developed. Fundamentally this entails that we go from only having an “exterior” perspective to learning, of seeing ourselves as a separate individual working with other separate individuals, to also including an “interior” perspective were we are working with consciousness, the most deep-seated part of who we are in every moment. As educators, this means learning how to give attention to the interior as well as the exterior dimension of the classroom environment which includes discovering how these two dimensions are intrinsically connected and continually influencing each other. It also means recognizing our own level of consciousness, and the importance we give to it, as not being separate from affecting this relationship. We outline a set of tools (It’s Your Choice, Where Are WE Right Now?, Sitting Still, and Talking Without Raising Hands) that can enable teachers and students to learn about and bring value and focus to this inner dimension of our experience, and the effect it has on our choices and behavior. Indeed it was our own experiences of this with our own students, several of which we describe below, that played a key role in developing this program. If we recognized every problem as being a problem of consciousness, of where we are directing our awareness and attention, then the simple solution would be to raise the level of consciousness in and outside the classroom, because as Einstein said, “We can't solve problems by using the same kind of thinking we used when we created them.”

Experiencing a Positive Compassionate Energy to Develop

Three years ago, after 24 years in as an elementary school teacher, Joan Berland had an experience in her classroom that would forever change how she taught. It was not rooted in a better or different way to teach the prescribed curriculum, but in something profound and more intangible. While sitting in a circle on the rug and sharing personal stories, Joan noticed a sense of quiet and calm she had never felt before. A second later the very air in the room seemed to get bigger. It felt as if someone had flipped a switch and filled the room with the most positive compassionate energy she’d ever felt. Her students felt it too, but couldn’t put it into words. What exactly was this energy? Where did it come from? Could it happen again? Was it always present but had never been tapped into before? How to create that energy and keep it alive in order to go somewhere no class had ever gone before was a thrilling prospect.

Concurrently in Sweden, Nick Drummond was working in an elementary school teaching anger and conflict resolution skills. He had been asked to teach a set of social competencies that the school wanted all the students to be taught. The challenge however was not only to teach these skills in as few hours as possible, but to do it in a way where most if not all the children were actively interested and motivated in what they were learning as well as putting the skills into practice!

It was at this time that Nick had a pivotal discussion with Patrick Bryson.[2] Nick was fascinated by Patrick's description of a conversation he'd had with a group of children in London. He talked about a depth of interest in the discussion that he experienced as something they were all sharing and actively creating together as they were speaking. Patrick explained the challenge, "Often when children are not interested or become bored, they physically slump over and start fidgeting, playing with things or looking out the window. They basically get distracted in themselves." When Patrick described children transforming almost instantaneously in their ability to listen to one another, respond to one another and remain focused on the one subject, Nick realized that it was of a whole different order than any of the discussions he had ever experienced with his own students! Their ability to listen and care for each other seemed to go way beyond a set of skills. Patrick explained, "Their interest is awakened, and that makes it very interesting to go with them in that and explore it. When this happens they seem to touch on a depth of knowledge that you wouldn't expect to see in young children. You wouldn't normally expect them to change this much so quickly. And that's probably because we are not used to seeing such dynamic and positive vertical change in children and also because we know very little about the conditions necessary to facilitate and support vertical emergence."

We Can Choose to Express the Highest Part of Who We Are Right Now

> Imagine a child in your class saying "I'm never going to be able to do this!" "I can't!" Whenever you encourage them they reply, "But, but, but!" Imagine being able to help them untangle themselves from negative beliefs about what is possible. Imagine them saying "I will!"

In his work in the Swedish school system Nick was having discussions with different groups of students about the positive and negative choices they were making every day. This crystallized into what eventually became the staircase model "It's Your Choice!" (see figure 1).

It has become a practical way to bring in the moral dimension of free choice in a way that is very understandable with all age groups. The model points out that you – and no one else – are always responsible for the choices you make and that you can always choose between two fundamentally different responses to what you are experiencing. You either see yourself as having a choice to respond differently, or choose to see yourself as a victim of circumstances and unable to change your response. It does not say how challenging this choice can be or what you should do; only that it is possible. There will be times when things can seem effortless and other times when life circumstances and experiences will be very difficult and challenging. It presents us with an opportunity and a perspective that says the kind of person we are is not something predestined, but the result of choices that have moral implications and that no matter how easy or difficult it seems how we respond always lies in our own hands.

It's Your Choice!
POSITIVE
Bad choices
• I don't listen
• I'm selfish
• I'm not nice
• I say mean things
• I lie/avoid the truth
• I have no self-control
• I don't show respect
• I can't change
• I feel sorry for myself
Good choices
• I listen to others
• I care about others
• I'm a good friend
• I give praise
• I stand for the truth
• I have self-discipline
• I show respect
• I have a choice
• I feel good!
NEGATIVE
"It's Your Choice!" © www.nordicintegral.com

Figure 1. It's Your Choice! Developed by Drummond and Edin in 2004.

The model is not about changing what we have done or changing how we feel in order to make a positive choice right now. It's a choice to reframe our experience, to face what is, to take responsibility for our negative tendencies, to act differently in a way that will change the future in every moment. It means becoming aware of our inner position towards what is happening and expressing what we deeply care about right now. So because our actions are not predetermined or random, it's our job to align them with our deepest intention. "Which side of your self are you living from right now?" Do your actions match what you, and we, care about? To find out you only need to look at what you are doing right now. The information you need may be no more complicated than to observe how you are sitting, listening and participating and what you are putting your attention on. When we make positive choices we express a creative potential, and care about the future and for other people. From this position we can make decisions and take action that could lead to positive development for everyone. And if we are on the negative side we never need to wait longer than a second or prepare in any way before we can choose to express the positive side. It could be as simple as saying to yourself, "I will" or "I won't". The model helps children, adolescents and adults understand, through concrete experience, that everything is dependent on where we choose to put our attention, and that this choice results in immediate as well as long term consequences.

Nick first recognized this potential in a meeting with a group of twelve year old children. Everyone was seated in a circle except the girl to his right who sat with her back towards him. She played with her hair and cast glances to the others, wanting their attention. Nick stopped, turned to her, and asked which side she wanted to live her life on. Without hesitation she responded, “The positive side of course!” He asked her why. She looked at her fingernails, “Because I want my parents to be proud of me. I don’t want to grow up and hear people say I have bad parents.” He asked her what side she had been expressing up until a moment ago, and again without hesitation she pointed to the negative side. He asked her that if she really did love her family how she would behave if she was on the positive right now. To his amazement she faced the group and put her hands on her knees. At that moment the atmosphere and attention in the group shifted significantly.

The staircase illustrates a vertical perspective towards life. It points out that our choices and behaviors are not all equal. What we do actually does matter! Negative choices lead downwards to a position of less and less care. We see our choices, our behavior, and who we are as being separate. As kids see it, you’re basically digging yourself a very deep dark hole to be all alone and feel very unhappy. Positive choices lead to deeper and deeper levels of care, awareness and integration. When we see our self as the person on the staircase, we recognize our potential to choose which side of our self we want to identify with and express in the world in every moment. Of course we may not be conscious of that fact and that is why a model like this can help shine light on this aspect of our life and any unwillingness we may have to face it and learn more about it.

Where Are WE Right Now?

In October 2007, Joan first asked her class of eight year olds to answer a simple but powerful question: Where are you right now as learners in school? Using a developmental scale developed by Drummond and Edin[3] which had 5 levels ranging from very bad behavior (I use bad language; I am sent out of the room; I speak without listening) to very good behavior (I take responsibility for what I do and say; I contribute actively to a positive atmosphere in the classroom) she organized her students responses accordingly (see figure 2). Not surprisingly, 23/39 of the things they’d written down fell into the Level 1 and Level 2 categories. This matched Joan’s experience that her class was easily distracted, not able to take responsibility for themselves as learners, and unaware of much beyond their own personal needs and desires.

Level	How Good a Student am I Right Now? Rubric
5	* When the teacher asks me to do something, I do it the first time. * I take responsibility for what I do and say. * I participate actively in all subjects and activities throughout the day. * I put 100% effort into everything I do. * I contribute actively to a positive atmosphere in the classroom. * I think about how my behavior affects other people in the class.

---

[3] Published in: “Ordning och reda i skolan – ett steg på vägen mot dynamisk harmoni i skolan”, 2006 Fortbildningsförlag Stockholm, (Order and Discipline in the School: One step on the Path to Dynamic Harmony in the Classroom).

4	* I make an effort to pay attention and do my schoolwork. * I understand how my behavior affects others and nearly always choose to make positive choices. * I behave and concentrate on my work. * I ask for help if I don't understand something so that I can complete my assignments on time. * I come to school prepared and ready to work. * I make an effort to get quiet when the teacher gives the signal.
3	* I can make good choices if the teacher or someone else reminds me. * Sometimes I think about how my behavior affects the class. * I don't get all my work done unless the teacher reminds or helps me. * I wait for the teacher to ask me if I need help with something I don't understand.
2	* I can't find books or materials at the beginning of the lesson so everyone has to wait for me. * I remember to bring in my homework, workbooks or library books from home on the day I need them. * I interrupt the lesson by calling out, humming out loud, or tapping the desk with a pencil. * I don't push or cut in front of anyone when I have to go to my mailbox. * I'm easily distracted (look out the window, get lost in personal thoughts, watch what others are doing). * I raise my hand if I have a question. * I sharpen my pencil before the lesson begins so I'm ready to do the work. * I take a long time to transition from one subject or area of the room to another. * I don't always remember to clean up after myself.
1	* I'm usually talking and not paying attention to the teacher. * I lay face down on top of my desk during a lesson. * I'm usually playing with things in my desk while the teacher is talking. * I often spill drinking containers on my desk or the floor and distract everyone while I clean up the mess. * I write on my desk top with pencils and markers or peel my nametag tape during a lesson. * I doodle on my paper during the lesson. * I holler out at the teacher or classmates during a lesson. * I call out silly jokes and disrupt the class. * I lean back so far in the chair that I almost fall backwards. * I fold paper into airplanes, fortune tellers, or cubes during a lesson. * I braid or play with my hair during a lesson. * I leave personal belongings on the floor where someone could trip over them. * I move my desk and it makes a lot of noise during a lesson. * I play with whiteboards, paper, or rulers instead of paying attention.

Figure 2. How Good a Student am I Right Now? Rubric. Developed by Berland in 2007.

Joan typed up the scale (adding some of her own ideas for Levels 3-5) then made copies for each child (which she minimized and taped to their desks), and gave one to each of their parents. She immediately started pointing out the behaviors as they presented themselves in the daily life of their classroom.

In the beginning, she would point out the times she saw children shaving erasers in their desks, folding paper airplanes during a lesson, writing on their desks, etcetera. The first few days were eye-opening for the children because they were truly not aware of the impact that their constant distractions had on the whole learning process.

It should be noted that Joan also pointed out the positive behaviors and role models as well. In less than a week, she was able to make eye contact with a child rather than stop speaking, hold up anywhere from one to five fingers and was instantly understood.

Now they were all ready to move on to something bigger and different. After one day of discussing positive and negative choices with the students, Nick and Joan sat down and wrote a new scale entitled “Where Are WE Right Now?” (see figure 3). It was at this point that the scale was renamed a “rubric” because that was the specific kind of developmental and grading scale that the students in Joan’s school were familiar with.

Level	**Where Are WE Right Now? Rubric**
5	**We care that the positive choices we make as individuals are strengthening the atmosphere in the class.** (At this level, a student is often thinking about what making positive choices means for not only themselves but the classroom atmosphere as well. As a result, energy emerges that attracts everyone at every level and has the ability to pull others up in their development. It is the place where role models and leaders begin to emerge.)
4	**I understand how my behavior affects others and nearly always choose to make positive choices.** (An individual is starting to take responsibility for the choices that they are making. There is a beginning awareness that they can have a positive effect on their ability to learn and participate in the classroom.)
3	**I can think about making positive choices if the teacher, a positive leader, or a peer role model reminds me**. (The individual child is still more strongly attached to their sense of self rather than something bigger, but is at least willing to consider making some changes if someone else takes responsibility for reminding them that they have choices.)
2	**I don’t really care about how my choices affect the whole class. I zigzag up and down between positive and negative choices throughout the day.** (The teacher constantly needs to redirect attention and behavior throughout the school day and the zigzagging reflects that learning is still not a priority. There is no meaning or purpose to their behavior other than they’ve always done it this way and are unaware of what they are doing and how it affects the class as a whole.)
1	**I make negative choices even though I know what positive choices are.** (The distractions outweigh the children’s ability to learn and the teacher’s ability to teach.)

Figure 3. Where Are WE Right Now? Rubric. Developed by Berland and Drummond in 2008.

This new rubric was written in about 20 minutes and they knew instantly that the words, levels, and expectation for what they wanted it to be were absolutely true and authentic. To this day, it has remained the backbone of what has happened and can happen when we consciously direct our awareness and willingness to develop.

In our work we have noticed that the quality of the atmosphere in the classroom – the quality of the relationships between the students and ourselves and everyone's willingness to develop – is not an accident. *The atmosphere is the sum of everyone's awareness and interest*. Knowledge about where we direct our attention is more important than our state of mind, our feelings or other people's behavior. As such we are always 100% responsible for how we are towards each other; we are always totally responsible for our behavior, and our choices. There is something radically simple and confronting about that as there is no room for excuses and there is no time off from being an integral part of what is already happening.

When children and teachers combine their ability to choose with the moral implications of their choices it directly affects the field of consciousness in a classroom. They can notice this instantaneously by looking at the effect their choices are having on the atmosphere in the classroom. The Where Are WE Right Now? Rubric reflects the continual development of values and ethical behavior within the classroom.

Vertical Development

When almost everyone in the class chooses to take responsibility for his or her own behavior and wants to express the best part of who they are, they can begin to express a care for vertical development. Vertical development occurs when the greater part of the class values caring about something that they previously did not care about and chooses to express that sense of caring. This creates an atmosphere of high expectations and developmental tension, where something higher – the best part in each of us that is continually reaching forward and wants to manifest – is pulling on something lower – the part of us that doesn't want to develop. When this occurs the class creates a cultural value that cares more about development – no matter what level they are at – than it cares about other things. In this atmosphere, we experience the potential for constant and positive development for all of us as always being possible and without endpoint. But more significantly, the result is that we as the teacher and the students are free to choose to change the quality of our relationship and the atmosphere in the classroom immediately!

When children and adults become aware of their own possibility for continual development and ability to choose between two completely different sides of themselves, they will choose to express that side that cares about maturity, development and the future. There seems to be a natural attraction towards it. They go from a set of cultural values that just cares about their own personal concerns ("I/me" level 1), to another set of values of wanting to make positive choices so that everyone can be stronger ("we" level 5). By choosing the "we", ones life can become an expression of meaning and purpose. When this happens, we see remarkable and immediate transformation - individually and collectively - in miraculous and forever astounding ways. We discovered that level 5 is not the goal but the foundation for higher levels of dynamic development and harmony. Helping a class experience and remain stable at level 5 can be very challenging, however once children experience level 5 they invariably want to reach and create higher levels.

> *Imagine finding a note on your desk that read: "Thank you for teaching me. I'm having a great year. I do apologize for any time I made the wrong choice. Thank you for introducing the rubric to me. Your trustworthy student, Tolla"*

Am I developing? What am I doing to further my development? Is my behavior aligned with my deepest intention? Am I facing and not avoiding what I need to face in order to develop? Our intention should be evidenced in terms of actions. The way to do this is to look back over the last day, week, month, term, semester, year, 5 years, and 10 years. This is not about our subjective experience of feeling we are developing, but rather objective observable evidence from the eyes of other people who can see objectively.

Personal Rubrics

In our work, we find that writing personal rubrics are a way for us – students and teachers alike – to become aware of our impulses, beliefs, sense of self and view on the world so that we can choose to respond in a more mature way. They're a practical way for us to make visible an area of our personality that we are not necessarily aware of, or want to see, but which we want to develop because of the negative effect it is having. Rubrics help give us an objective perspective on our behavior and strongly held limiting beliefs. They offer a way to step outside of them by structuring what needs to change. For a child this may mean writing a rubric for how to make friends, how to line up, how to keep one's desk clean, how to study for a test, how to do homework and how to listen. It's unrealistic and even unnecessary to stop someone from thinking or saying "I won't", or "I'll never be able to…" However by using a rubric we can make our limiting beliefs about something observable whenever such a response arises. It introduces another possibility in the form of a choice in every moment to not become one with our limiting beliefs even when these are present. It is a concrete way to help move from a position of "I can't" to "I will".

After we introduced the Where Are WE Right Now? Rubric something unexpected happened. Joan's students started to take home the rubrics to share with their parents as well as spontaneously becoming interested in writing their own rubrics. The first student to do so wrote a rubric for the exercise Sitting Still (described below) and also began teaching her 5 year old brother how to do it! One student even told her mother, "You're at a 1 and you need to sit still for awhile!"

The following year one of the students in Joan's class who was very attracted to the work from day one sat down during snack time and wrote her own rubric about making friends (see figure 4). After she shared it with the class, other children were inspired to write their own rubrics. By the end of the week, the class had 20 rubrics that ranged from how to line up, to keeping one's desk clean. There were rubrics for handwriting, pet care, getting ready to Sit Still, sportsmanship, being a good helper, and studying for a test.

Level	Making Friends Rubric
5	I have a lot of friends and we play altogether.
4	I have a lot of friends and I take turns playing with them.
3	I will meet someone new if they ask me to play with them.
2	I am friendly with more then one person, but I never play with them.
1	I play with only one person, and I don’t like meeting new people.

Figure 4. An individual rubric for making friends. Developed by a student in 2009.

The students could write a rubric about something that they are having difficulty with and care about being better or they might write a rubric because they are attracted to a level 5 or higher. By writing the rubric they can figure out how to get there. It becomes a way for them to bring a structure to what is not seen and what is happening, open up for other choices and allow for a different form of discussion. The rubric becomes a way to clarify a goal and write the strategic steps necessary to reach it. It enables individuals to more objectively judge, measure, and compare the quality of their behavior and level of their care, strength, conviction and authenticity right now, and take appropriate action. For example, as in the above rubric, if you come in after each break saying that you played with only one person and didn’t meet any new people, it is clear that you are not aligning your behavior with your higher intention of wanting to make new friends. By aligning our choices with our highest level – right now – we express authenticity and become authentic individuals. We make very different choices and become very different people. You will hear it, see it and feel it.

Creating Space for Development by Sitting Still

Sitting Still is an exercise we use for helping students focus their attention on stillness. When we practice Sitting Still we are practicing our ability to choose a position towards life – a position that creates space for consciousness to grow. No matter what happens, we are choosing to remain still, not make a problem of anything, and remain fully awake to what happens without engaging in any of it.

We introduce and work with this exercise in various ways depending on the group, but we always keep the instructions simple: sit still, be relaxed and pay attention. This exercise goes beyond giving children theoretical knowledge about something; it gives them a positive experience of not knowing and the experience of continually wanting to know more. What does stillness mean? What does being relaxed mean? What does paying attention mean?

We often hear children telling us about how Sitting Still is benefiting them and the class in some profound way. A common experience is one of having difficulty concentrating and feeling distracted not only by other people, but by different voices in our mind. One eight year old said that whenever you experience a monster in your head telling you what to do, "Just drop it! If you can do that when you're sitting still, you'll be able to do it at other times during the day as well." One child even asked if he could be President of the United States one day if he got really good at sitting still!

When verbalizing their experience of sitting still over a prolonged period, many children have expressed that they feel like they are in a "zone". From this place they give less and less attention to their thoughts, are often unaware of their body in real time, and feel like they are creating an energy of oneness in the classroom. This is described on the following rubric generated from the students themselves (see figure 5).

Level	Sitting Still Rubric
10	We generate our own energy.
9	You are holding a Level 5 or higher.
8	You get in the zone.
7	You are not aware of what you're thinking about.
6	Drop everything.
5	Complete Stillness.
4	I am able to sit still for most of the time.
3	I can sit still if someone reminds me.
2	I zigzag between fidgeting and being still.
1	I fidget and move around the whole time.

Figure 5. Sitting Still Rubric. Levels 1-5 were developed by Sugden in 2008 and levels 6-10 by Berland in 2009.

After Sitting Still, we often talk about our experience and the discussions are filled with an aliveness and newness. As one student said, "You create something from nothing!" When sitting still together and talking about it, it's possible for children to collectively experience and cognize a deeper dimension of who they are in a way that connects everybody in the classroom almost instantaneously. As one nine year old said recently, "When we do it individually it's powerful. When we do it together it's unstoppable!"

Talking Without Raising Hands

> *Imagine a colleague visiting your class and experiencing a conversation with a group of children where no one raises a hand and no one interrupts?: "How do you get them to do this? How do you get them to listen to each other and stop them from all talking at once? I've never seen so many kids behave this way before? How did you get everyone to participate?"*

Have you ever noticed that it's very difficult for children, and even adults to deeply listen to each other in a way where they are more interested in what the other person is saying than in their own thoughts?

It's important that children not only have direct experiences of what it's like to be at level 5, but also the recognition of what it means to operate together from a 5 or higher. "Talking Without Raising Hands" is an exercise that is used in conjunction with the other three tools we described to catalyze and give them a taste of that experience, of being in and actively caring about creating a creative space where new possibilities are seen to emerge individually and collectively. The exercise involves seating the group so that everyone can see each other, being as still as possible, looking at the person who is speaking, following the thread of what is being talked about, and participating without raising your hand.

Intrinsic to this kind of discussion is a deepening exploration and recognition of the different values that influence our choices and patterns of behavior. Though there are many values at play in a classroom and this topic is open for much study, the ones that we often begin with are respect, listening, stillness, responsibility, interest, awareness and care. Discussing these values in the way we describe here has the effect of potentially heightening and strengthening everyone's level of *integral* awareness, where the interior and the exterior dimension of the classroom environment, as well as the individual and the group all come together in one exercise. In order for this to occur, the children have to know what vertical development is about. This can happen if the teacher points out to the children when development is happening, or when we hear someone speaking in a more authentic way. Pointing out changes in how people are listening, showing care, following on from each other or creating space for others to participate is necessary in order to reach a level 5. However something significant happens when children themselves notice when development is occurring – the way they communicate with each other starts to change in a radical way and they are aware of not only their own actions in making this happen, but the significance of what it means.

> *We were talking about different social groups in our class and that someone can be in several. Then Nick said that Adam brought up a really good point when Adam said that a social group can affect your choices in both good and bad ways. Nobody really got it and we started talking about other things. Then Emma said, "It's not that what everyone else said is bad, but what Adam said lifted the discussion to a higher level."*

What if there was just one conversation and everyone built on what was said before and where original thoughts were being expressed like fireworks? A conversation where everyone's awareness was more on caring about what was happening in the group than on themselves, where everyone was participating and listening and following on from each other and no one wanted it to end, where you felt completely energized afterwards, and learnt something valuable and meaningful. Where the space we were creating that enabled these new possibilities was more significant than the topic of discussion. What if this wasn't a one off discussion, but a regular feature in a weekly program?

We are finding that when children experience this kind of discussion there emerges a heightened awareness between them and a tangible sense of being part of and caring for what is happening. This is in stark contrast to them feeling left out or even separate from everyone else in the class in some “special” way. The children can and do experience a tangible connection between where they are choosing to put their attention, what is happening in the room, and what is being created between them.

> *Sami noticed that the girl sitting next to her was crying. She waited for a chance to join the conversation and said, "Graycee is upset because she thinks she’s never been at a level 5 in her life. I said that if she’d never been at a 5 she wouldn’t be willing to do all of this work." Joan seized an opportunity not only to help Graycee feel better about where she was at as she developed, but to point out how Sami was being a role model and leader. The conversation continued for days which eventually allowed all the children to identify what qualities they possessed that reflected leadership potential and what qualities they wanted to grow into.*

What emerges is a whole lot of care and respect, a space that is utterly positive, and as one twelve year old student expressed, “All my problems just went”. In this space they are paying attention to the person who is speaking and are caring about what is being said. You may begin to experience having people speak who normally never speak and everybody in the group listening and valuing what they are saying. Likewise, other people begin to drop their persona of being the “clown” or someone who talks and never gives room to others, or acknowledges the significance of what is happening. That which comes out of the discussions, and the potential for development that individuals express, often flows into and affects the rest of the day and week. In this way a bunch of children become a dynamic community who support everyone’s vertical development. The thrilling part is that even if a group is experiencing difficulty in having a discussion at this level, once the models are being discussed a vertical dimension has been introduced; there is a shared expectation that something better is possible.

> *While sitting together during morning meeting, a boy in Joan’s class asked what a level 8 would be on the Where Are WE Now? Rubric. She replied, “I don’t know, it doesn’t exist until you create it. What do you think it should be?” Joan looked around the room and noticed that the entire class was on the edge of their seats, leaning into what was about to happen. Because other moments like this had occurred when levels 6 and 7 emerged (see figure 6), there was a visceral response and expectation that something new and powerful was about to happen and that everyone in that room at that moment was a part of it.*

The feeling in the classroom is often experienced as a dynamic atmosphere or field of energy between us that takes form as an excited desire to develop that everyone in the class is affected by. The quality of this vibrant atmosphere shared between us is not a chance accident, it is affected and brought into life every moment by what the teacher and students choose to focus on, say and do. In fact the more we as teachers start to see it this way then the more we realize that everything we do is always having an affect on the atmosphere in the class. Is it expressing this vibrancy or not? And even if the vibrancy is absent, where do we have our attention? There is something incredibly positive in realizing that there is no time off from consciousness and that everything we do is important. When we as teachers start to see life this way, then children can lift themselves to unforeseen heights through directed attention, clear guidelines and expectations about vertical development being possible. They have confidence in life, in being able to reach higher, in clear developmental goals to strive after, because we do. When we reach higher so do they, and when they reach higher so do we. Our development and the development of the children become inseparable. Imagine what it means to be teaching and learning from this place?

When children share this absolutely positive vibrant experience to develop, they inevitably want to know what it would be like to be at a 10, 20, 50 or even higher. This vertical impulse results in continual development of the Where Are We Right Now? Rubric. How these levels will look over time will be exciting to find out. What's certain is that levels 6 to 10 (see figure 6) have already emerged as a direct result of the children's experience of consciousness and will continue to so as long as we continue to do this work.

Level	**Where Are We Right Now? Rubric**
10	More than anything else we want to create an optimistic energy that is so strong it can positively influence people in the world. We want to do it because we care about making the world a better place.
9	If we want to make a positive contribution to the world, the important source of energy is TEAMWORK.
8	We choose to hold a level 5 or higher so that we can be role models and leaders in school, in our families with friends, and in the community.
7	You take the 5 atmosphere beyond the school and out into the community and share it with family and friends.
6	Everybody cares about creating and holding the atmosphere because we want it to attract the whole school.

Figure 6. Where Are WE Right Now? (Levels 6 to 10). Developed by Berland in 2009.

The Mystery Behind Human Transformation

> *After five weeks, a nine year old boy who had been one of the most disruptive in Nick's class said, "If this staircase leads up, then where does it end?"*

We have created a structure in the form of a program for describing how to create dynamic development and harmony in a classroom, but there is still something mysterious and unpredictable about human transformation. There's a part of this process that is always completely unpredictable. You will meet children who will hang out on the negative side for what will seem like eternity and have you pulling your hair out, questioning your own trust in the entire developmental process. A boy in Joan's class was unembarrassed to announce to the class, "I don't need to make positive choices now. I can do that when I'm in heaven because there's nothing else to do there and I'll have lots of free time." Then suddenly something happens – maybe a simple conversation – that brings about a 180 degree wind shift. On the way out to the buses one day, Joan mentioned to the above child that she was going to be talking with some teachers around the world about the rubrics in their class. "The world" he said, "I thought it was just in the United States." "Does that make a difference?" Joan asked. "Oh yes," he replied, "If it's the world, I'm in!" Then he disappeared into the bus. You could call it the x-factor. We wish we knew what it was; what is it that causes someone to suddenly choose to align themselves with a deeper realization? We don't know. There is something about vertical development that is mysterious and unpredictable. That is what makes the experience of working with the development of consciousness very thrilling and very challenging. This is why it is invaluable to have a community that can support you and your own development.

Reaching Towards a New Potential in Childhood Education

We live at an incredible moment in the history of human development. Cultures with world centric values offer children an opportunity to become global citizens, with skills and knowledge to take full advantage of the benefits, opportunities and choices that a borderless world has to offer. While this is an unprecedented achievement, we also have to begin teaching children what it truly means to see and directly experience themselves as an integral part of an evolutionary perspective that is alive and unfolding in every moment. By valuing vertical development ourselves, we inevitably teach children that their lives can be lived with meaning and purpose as part of the process. It too deserves a place of importance alongside the opportunity to learn the three R's: reading, 'riting, and 'rithmetic. If the sum of a person is *more than* all of its parts, then developing consciousness is truly the missing integral link in our education system.

Acknowledgements

We want to thank Andrew Cohen for being a role model as a teacher and for continually inspiring us to push the limits of ourselves and what's possible.

A Perspective on Kesler's Integral Polarity Practice

Tom Murray[1] with Terri O'Fallon[2]

On the journey of many places, many voices
A moment of recognition
Opposites experienced are not
Still point of breath
A flower opens
A cloud drifts to reveal the sun
A drop falls, merging with the pool
Witnessing that small opening of stillness
Then looking into, into, into------entering;
The place of all stillness
Then from all stillness something looks
Back upon and as the witness.

On a sunny spring day in 2010 in the upstairs studio of the Center for New Knowledge in Northampton, Massachusetts, twenty of us were taken on a journey to glimpse rarely experienced lands of paradox and polarity, fullness and freedom. The territory had been mapped out by John Kesler, who was guiding us through voice dialog activities as part of an introductory workshop for his Integral Polarity Practice (IPP). I later wrote the above poem reflecting on my experience. I am always moved to be in the presence of a group that comes together with an intention of going deeply within. IPP (like some Bohmian dialogs I have attended) set up a vibrant collective field on that day, at least to my experience, and the sense of the 'we" was thick, deep, wide, and buzzing.

John began by using the breath as an experiential metaphor for bodily connecting us to that place between the poles of expansion and contraction; a still-point of perfect relaxation that is available within every breath. Something wonderful occurs in the mind/body when the poles of a polarity are seen and experienced to inter-contain each other as manifestations of a single prior essence. From this foundation John lead the group through a sequence of contemplative reflections on polarities that broadened to include transcendent clarity and sublime confusion; transcendent sorrow and impersonal joy. The room was alive with these energies, which were not brought to or created for us, but discovered by us, thanks to John's gentle yet passionate guidance. A few tears of rapture were seen to run down cheeks and we parted with smiles and hugs, and carried home whatever stays with one from glimpses of the sublime.

[1] **Tom Murray** is an independent scholar and consultant working on projects at Perspegrity Solutions and at the University of Massachusetts. Info: www.tommurray.us, tommurray.us@gmail.com.
[2] **Terri O'Fallon** is a Principal at Pacific Integral (www.pacificintegral.com). Terri provided important feedback and suggestions for this article, and offered the poem at the end. Terri has been working with Kesler and IPP for five years. As, mentioned in the article, Tom is relatively new to IPP.

SOME RIGHTS RESERVED

I met John Kesler less than a year ago when I had the opportunity to attend two of his Integral Polarity Practice workshops, one sponsored by the Seattle Integral community and one at Next Step Integral's Integral Education Seminar. John is one of the few people certified by Genpo Roshi to facilitate large groups in the Big Mind process, which is familiar to many in the integral community. His IPP broadens Big Mind voice dialog work to include aspects of Cook-Greuter's developmental sequence of action logics and polarity frameworks from Tantric and esoteric Mormon traditions.

I was struck by the elegance and depth of Kesler's IPP "awareness and meditation practice" and became an immediate fan. I've been fortunate to have had the opportunity to dialog and work with John in several individual and small group phone sessions over the last year, and I helped to organize John coming to Massachusetts (he lives in Utah) to lead a series of introductory workshops in April. Though I am very much a beginner in IPP, I would like to take this opportunity to introduce readers to it from my own perspective. As I feel rather insufficient to the task of explaining this profound body of work, I will say a bit about "why me?"

Like others attracted to the integral community, I have deep interests in contemplative awareness practices and theories of human development and the evolution of consciousness. In addition, through my interest in epistemology and the psychology of knowing, I am fascinated by polarities (and paradoxes). When I saw that John's work combined all of these I was hooked. John impresses me as a deeply humble person whose life is filled with many types of service and community-based work (it seem as though in every conversation I have with him I find out about yet another branch of his volunteer service work or professional community work that astounds me).[3] IPP, its teaching, development, and dissemination, is one of many projects that John juggles. Thus, due to time constraints and having a personality that is not oriented toward self-promotion, John's work remains more obscure than its quality and depth merit, in my opinion. I express my excitement for the work and my gratitude to John for the development of IPP by sharing what I know of it below. More information is on John's web site at www.johnkesler.com.

I will start by describing elements of Big Mind that are present in IPP. John is one of the very few people to have been certified by Genpo Roshi to lead the Big Mind process in groups outside of Zen monestary settings (Dianne Hamilton and John were the first to be so certified). Genpo Roshi developed Big Mind by combining elements of traditional Zen practice with insights from Jungian psychotherapy, in particular the Voice Dialog process developed by Hal and Sidra Stone.[4] In voice dialog the facilitator helps the individual or group engage with inner archetypal voices or sub-personalities, such as the protector, fixer, rebel, nurturer, or vulnerable child. Genpo modified voice dialog methods to use them with large groups and to address aspects of the ego that typically resist deep contemplation, reflection, and ego transcendence. For example, the inner Controller or Skeptic can be addressed, appreciated for its role and value to the Self, and asked if it would be willing to relinquish some control and trust the (workshop) process.

---

[3] John's primary profession is as an attorney. Among other projects, he works with educational, civic, and health care institutions and systems locally in Salt Lake City, and also internationally. His is an ordained Mormon Bishop, and finds inspiration in the esoteric and contemplative aspects of Mormonism and other spiritual orientations, including Buddhism and Tantra.

[4] For more about the Stone's Voice Dialog, see www.delos-inc.com. For more about Big Mind see www.bigmind.org.

In Big Mind and IPP workshops the facilitator moves through a sequence of such "voices," beginning each by saying that we will now speak to or invite the voice of, for example, The Skeptic, and then asking the group "Who am I speaking to?" Participants answer (more or less in unison) "The Skeptic" or "the voice of the Skeptic."[5] The facilitator continues by prompting individuals in the group to publicly reflect on this aspect of the self with questions like: "What is the role [or function] of the Skeptic in your life?" "Does the Self listen to [or appreciate or honor] the Skeptic?" "How much do you [the voice of the Skeptic] communicate with [understand, relate to] the voice of Submission [or Trust, or some other archetype]?"[6] In a session I might report that the Skeptic seems to be in the way of my (the Self's) goals. Another might notice that the Skeptic plays a crucial role in the Self avoiding errors of naïveté. In that moment—aha!—my own understanding of the role of the Skeptic expands into new insights about it and myself. As each person adds their perspective on a Voice, the full breadth and depth and complexity of the role of that Voice comes alive in the room and its presence deepens palpably as if it was something invoked there in our midst and speaking collectively through us (I say "as if" to be post-metaphysically agnostic as to whether such is actually happening[7]).

The process facilitates a deep exploration into both the impersonal and collective nature of human aspects such as Desire, Agency, Leadership, Peace, and Curiosity (these are taken from the IPP method), but also facilitates the inner exploration of one's relationship to these elements, as they live as strengths, weaknesses, shadows, gifts, and unrealized potentials within. In addition it can efficiently create an expansive sense of "group mind/consciousness" that, in addition to accelerating the process, contradicts the isolated individualistic nature of many spiritual practices. The practice is an excellent example of a "liberating structure." Kesler offers guidance based in his own realization attainments, but primarily the practice sets up a structure that allows each individual to voice their own wisdom and insight, and expand into and through the group's collective wisdom and insight. It supports participants in identifying their unique gifts, challenges, and shadows (including what Kegan & Lahey would call "immunities to change"). It strikes a pitch-perfect integral harmony between the modernist innovations of democratic, autonomous, individualistic, and pluralistic forms of meaning-generation and growth, and the more traditional hierarchical forms of meaning-generation and growth (wisdom and guidance from sages, gurus, priests, and other honored teachers) that are seen in the wisdom traditions, offering benefits that post-modernity has made it difficult to integrate (this balance or harmony is as much from Kesler's deeply humble style as the IPP practice). (See the article in submission to JITP by Zachary Stein titled "On Spiritual Teachers and Teachings" for further explorations of the theme of the "dynamics of authority in educational contexts where teachers and students engage with religious or spiritual subject matter.")

---

[5] Kesler frames voices in terms of impersonal or transcendent "functions and energies" as opposed to sub-identities of the self. For example, he will ask to speak to "The [voice of] Control" rather than "the Controller." This further helps the participant dis-identify with sub-personalities as inflexible and non-integrated (and immature) aspects of the Self.

[6] The group process can seem a bit artificial to the—well, to the Skeptic—but if one can suspend judgment and open one's trust and imagination the process can be quite revealing and energizing.

[7] My goal is to describe the surface features of these processes, and not to express claims about, or imply anything about how Kesler or Genpo Roshi describe, the deeper processes and realities that the practices work with. Also, the example of voices and activities given here are meant to give the reader a general feeling for the work, and are not meant to represent the exact sequencing, voices, or instructions given by any of the leaders mentioned. Leading a Big Mind or IPP session involves non-formulaic on-the-spot decision making that requires deep expertise.

Genpo discovered that through the Big Mind process, a skillfully facilitated sequencing of voices, participants can experience a taste of transcendent states such as Big Mind, Big Heart, True Self, and Great Joy, that took much longer to access with traditional contemplative practices (and in particular traditional Zen practices).[8] Whereas voice dialog was typically used to access the sorts of early childhood and primitive archetypal aspects of the self that psychotherapists treat as shadow elements needing to be healed or integrated, Big Mind includes giving voice to transcendent and evolutionary potentials that we can grow and evolve *into* (as opposed to out of or beyond), and facilitating access to transcendent ("non-dual") states. Genpo's key insight was that, because of the more developed and prominent role of the ego in the Western vs. Eastern mind, in leading the Western mind down the spiritual path to awakening it is better to engage the ego and its core elements directly, to work with ego rather than ignoring, suppressing, or forcefully eliminating its presence. (For more on Big Mind see www.bigmind.org and the Wikipedia entry on it.)

John Kesler's Integral Polarity Practice adds innovations to the Big Mind process that make it more "integrally informed."[9] First, he developed a sequence of voices (or energies/consciousnesses) that follow the ego developmental structures fleshed out by Lovinger and Cook-Greuter (it also has easy correlations with Beck and Cohen's Spiral Dynamics and other developmental models mentioned in Wilber's work). Whereas psychotherapeutic voice dialog aimed to integrate or heal shadow elements, and Big Mind uses a sequence of voices with the primary goal of opening up to transcendent states, each "rung" in the sequence of elements of IPP represents an aspect of human development that can be explored, deepened, and integrated, and yet also leads to higher states and stages of human development.

The second innovation of IPP concerns polarities. At each developmental level, one works not with a single essence but with a set of polarities, such as expansion/contraction, desire/aversion, leading/following, achieving/digressing, or meaning/paradox. These polarities, in order of increasing development, are five (not all adjacent) representatives of the 12 levels within John's "evolutionary" (or ascending) sequence. The evolutionary sequence includes two IPP levels for each of Cook-Greuter's six higher action logic stages. In working with polarities one explores the pole's two extremes, one's relationship to each pole, the interaction and energetic connection between the poles, the "still-point" that represents the resolution or integration of the poles, and the dynamic holistic system transcending and including all these elements. Due to the richness of the system, in an hour session one might only explore two or three of the 12 levels. Importantly, the experience of the still-point or integrated manifestation of each polarity can be a portal into non-dual or transcendent states or levels. Thus, though it may take many sessions to work with and through all 12 of the evolutionary IPP levels, in each session Kesler leads participants through what he and Wilber's integral theory call gross, subtle, casual, and non-dual elements.

---

[8] Note that the practice is said to support getting a *taste* of such experiences with unusual efficiency, but does not purport to lead directly to the more stable states and stages that prolonged contemplative practice can yield.

[9] Kesler does not see his system as in any way competing with Genpo Roshi's Big Mind work. It is a related practice with overlapping but non-identical goals and methods. Kesler was one of the founding members of the Integral Spiritual Center.

IPP also has an "involutionary" (or descending) sequence that starts with Big Mind and explores how the ground of being (Big Mind) works its way into causal, subtle, and gross levels of experience and reality. The theme of gross/subtle/causal(/witness)/non-dual repeats itself fractal-like at multiple levels and in multiple directions within IPP.[10] For example, the entire system of levels is divided into gross (physical), subtle (relational), and causal/non-dual (involutionary) segments; within each of these three segments is a gross/subtle/causal progression of levels; and within each level one explores gross, subtle, causal, witness, and non-dual states that emerge from (or exist prior to) the polarity. I quote here from Kesler's web site:

> …distinctive in this practice is the discovery of the same five themes which pervade every aspect and dimension of life experience. The five themes are physical / gross, relational / subtle, aware / causal, the ground out of which the three themes emerge, and their integrated expression. Through IPP life become an aesthetic experience of the integration, interpenetration and flow of the themes…[IPP] engages the person on multiple levels, triggering differentiation through more discriminating awareness and moving toward integration and transformation, with the impact over time of increasing awareness and capacity in multiple dimensions.

The entire system, though elegant and fascinating, is complex and intricate, especially as compared with the Big Mind system, which one can have a fairly full experience of in a single workshop (full in terms of seeing all of its components; while of course layer upon layer of depth awaits the sustained practitioner of any contemplative practice). In contrast, in a day-long workshop with Kesler one taste's just the tip of the iceberg. Each level contains not only a developmentally-anchored polarity and two still-points, but a "doing virtue," a "becoming (or being) virtue," and set of pathologies (like "hindrances").[11] For example, the Seeking level (level 2) has poles Desire (with its pathology Addiction) and Aversion (with its pathology Repulsion); a positive or fullness still-point of Satisfaction; a negative or emptiness still-point of No Seeking; a becoming virtue of Gratitude; a doing virtue of Generosity; and a "gift" of Sacred Motivation.[12]

---

[10] The terms subtle, causal, and non-dual have a range of meanings both within and outside the integral community. My own experience with IPP and other contemplative practices has given me a taste of what these terms could be pointing towards, but my understanding and experience of them is evolving and not stable. In this article I am simply reporting using the terms as used by Kesler (and, I would say, used too casually in the integral community) and will bypass questions of what the terms might actually point to.

[11] The system seems to have some interesting similarities to traditional systems such as the Kabala, the Buddhist system of virtues and hindrances, the Vedic chakra system, etc. (which, as others have shown, in themselves have fascinating correspondences). This is no doubt due to John's integrating a familiarity of the mystical aspects of a number of traditions.

[12] Kesler has been refining IPP for about 10 years, but considers the entire system still under development. He distributes copyrighted handouts at his workshop, but has not published the entire system in the public domain yet. This is one reason I have not given a chart of the entire system. One can imagine that, in addition to its evolving nature, Kesler has kept the material out of the public domain to minimize the likelihood that people would try to use or teach it without the requisite level of skill and legitimacy.

IPP is distinctive in the way that it integrates a systematic exploration of state experiences within a developmental/evolutionary model; and does so in a way that gives life to both interior and collective forms of wisdom; and with an awareness of the role of shadow in personal transformation. Contained within its many aspects (polarities, virtues, still-points, etc.; through many involutionary and evolutionary levels) it covers territory pointed to by many psychological, archetypal, and spiritual typologies. Its range extends from the earliest to the latest stages and the full range of gross subtle causal, non-dual states (upper left quadrant), energies (Wilber's upper right quadrant), collective responses and meaning making (lower left quadrant) with a voice dialog structure (lower right). Thus it is unique in how it fully embodies Wilber's AQAL meta-model, with its quadrants, states, stages, lines, and types, and works across the elements of the Wilber-Combs Lattice (a "cross product" of the states and stages of the AQAL model). It does so in a way that shows the interpenetration of all of these aspects, and is thus an ideal practice for the study and expansion of the AQAL model at it is and could be.[13]

This essay has focused on IPP as a lead process activity that can engender certain states and experiences that, over time, are intended to lead to horizontal and vertical growth along several developmental lines (including what might be called ego development, construct aware cognitive development, emotional/social development, and spiritual development). But, for Kesler and for many practitioners of IPP, these experiences are a support mechanism for a holistic life *practice* and *action* orientation. Kesler has written much about (and initiated numerous projects in) integral approaches to civic engagement and service work. IPP, as a sustained practice within an informal sangha of practitioners, orients ones values, visions, and actions, substantial and mundane, toward the highest Kosmic and ethical resonance that one can source within oneself; sensing into what Kesler calls "the ever present sacred ecstasy and ordinariness of life."

The steel web of mind's hypnosis
Wears thin and Tears-from
Divine's "I's" dissolve into
One
Showering its essence
Into Forms--each paradox and
Soul, each finger and sound
Distinctions with no division
Frogs with no plops
by Terri O'Fallon

---

[13] For example, there is still much to be figured out about the relationship of states to stages, and the relationship of types to states and stages in the context of lived experience; also articles by Bonnie Roy on her Process Theory draw on experiences that interpenetrate the quadrants, zones, and lines of AQAL. As clearly stated in Wilber's Three Strands argument and his integral post-metaphysics, these issues can not be worked out though intellectualization alone—we must dive into and dialog about experiences.

Bringing Integral to Management Consulting: An Interview with Rick Strycker

Jonathan Reams

I came in contact with Rick Strycker around 2001 through a list serve on integral organizational development and leadership. Rick had recently begun working at JMJ (www.jmj.com) and was also trying to finish his academic work. We had a number of interesting phone conversations that gave me an insight into the challenges of bring an integral perspective into organizational life. Recently we got together to discuss Rick's background and work.

JR: Can you give me a little bit about your background?

RS: I have been at JMJ for the last 10 years. JMJ is a management consulting company and I am their Director of Development. That's been my job since I arrived here and the role is basically to ensure that our consulting practice is current and market-oriented, that we are designing and delivering work that makes a difference for clients. That scope includes both practice development and consultant development. It also has a strong element of Marketing Communication to it. I have a team that helps me fulfill those various accountabilities.

JR: What was your background before JMJ?

RS: I often talk about having 2 careers before JMJ. Just before JMJ I was a graduate student and doing several part-time consulting jobs. I had gone back to school in my mid thirties to do a PhD program in philosophy. I got about half way through and switched over to organizational psychology and ended up doing a hybrid program, putting together organizational change with critical theory and postmodern thought. I was in Claremont, California going to school, doing research, and cobbling together work projects related to my academic pursuits. I did some work for McKinsey on a research program that they were doing on the perceived shortage of good management talent. I did some research for Csíkszentmihályi, who had come to Claremont, that later became a book that he wrote on Good Work. I did some work for the Motorola University in the leadership college. I did that for about six or seven years, as well as working at the university for a think tank. I was doing this while supporting a family, so as you can imagine, I was pretty stretched.

Prior to that I was a small business owner in Portland, Oregon and I had a graphic design studio and I specialized mostly in high quality color printing and publishing, and was involved in the first wave of desktop publishing, and publishing to the internet. I did that for about ten years, from the time I was 23 until 33. Then I went back to school and did an academic track, thinking I was going to become a college professor. Before too long, I realized that academia moved way too slow for my appetite, then found my way into consulting which was my way to integrate my intellectual curiosity with my need to get stuff done.

SOME RIGHTS RESERVED

JR: *When in that did you come across integral thinking and theory?*

RS: In graduate school. It must have been around ’96. I was in a transition period between my philosophy program and my organizational psychology program. In philosophy my interests were already very multidisciplinary. I was interested in ancient philosophy, especially Greek thought. That led to an exploration in depth psychology, eastern and western mysticism, and esotericism. Suddenly, I got very interested in post modern thought, critical theory, feminist, queer theory, and so on. I was just kind of hopping around but then did some focused study in Whitehead, Wittgenstein and Heidegger. I wasn’t exactly what they were looking for in a model student.

JR: *So in a way you were already kind of integral/transdisciplinary.*

RS: Yes, I was looking for that but I couldn’t find any support for that in academia so I kept hopping into a group or into a department and what they wanted me to do was go deep into one thing, like you could be a Wittgenstein scholar or you could be a Heidegger scholar or you could go down into the roots of depth psychology (mainly to critique it), but don’t mix them up. That was getting really frustrating to me because the departments really didn’t talk to each other. They only spoke within their own discipline so the Kant scholars talked to Kant scholars, they don’t talk to the Existentialists and they don’t talk to the psychologists and they especially don’t talk to the business people. It’s just the way academia is set up.

So I was really getting frustrated and was walking through a book store and saw one of Wilber’s books. It was *A Brief History of Everything.* It had just been published and I opened it up to the middle and I read a page and I thought “oh, my God this is somebody who’s writing about the kind of things I am interested in,” and just bought the book on sight, digested it and got so excited about what Wilber was doing. I loved his sense of humor for one thing because that was something I just didn’t get any of in the world that I was in at the time. So I decided that I was going to change my thesis to something on integral, I didn’t care what it was. So I contacted the only person I knew that was in California that would be connected to integral which was Roger Walsh. So I wrote a letter to Roger and he emailed me back within a few days and he said you need to get connected with Ken. He sent my information over to Ken and we started an email relationship within a couple of days. He and Ken and Don Beck had just recently met and I got into a kind of a three way email dialogue with those 2 guys and within, this must have been 98’ 99’ something like that, near that time Wilber decided to form the Integral Institute. He had just recently gotten a big grant, or at least the promise of a big grant and at the time he thought he was going to get 50 million dollars, and he pulled together about forty people that he thought could help him form the Integral Institute and that was the business group. I got invited to that group, mainly because I was in conversation with him at the time. So by default I became a founding member of the Integral Institute.

JR: *I know some other people that were a part of that it and I guess it has had a whole history of ups and downs.*

RS: That was my entre into integral. I did get connected with several other people where I could continue to grow. I ended up reading pretty much all of Wilber's books. The critical connection there for me was that at that initial meeting which at Wilber's house I met Geoffrey Gioja who was the CEO of JMJ Associates, and he and I clicked and started to form a friendship. To make a long story short he hired me about 9 months later. His main purpose, because Geoffrey was really taken with Wilber's work, was that he wanted to bring integral more into the business world and had already begun to introduce it at JMJ. So he hired me basically to help bring integral more fully into JMJ's consulting practice.

JR: So no small task.

RS: (Laughter). Some might say an impossible task.

JR: Maybe say a little about the focus of clients that JMJ was and is working with.

RS: Let me say something first on the nature of the impossible task. It is one thing to find a group of people who are already interested in integral and have read the material and are looking for ways to apply it to work and then pull those people together and form an integral consulting company. It is another thing to come into a company that is already 15 years old and well established in what they do, who have had a taste of integral thinking, and then try to introduce integral to that group so that they really embrace it as their primary model for working with clients. That has been the nature of the challenge. JMJ was already established, had some successes, and had developed a strong culture around other models. Fortunately, those models could be correlated with integral, otherwise the task really would have been impossible versus just improbable.

So, a little about the work. Over the last 22 years at JMJ we have mostly worked in major capital projects all over the world. A major capital project typically runs from two hundred million dollars and up, but for us projects have gotten much bigger over the years. A small one for us now is a five hundred million dollar project. Many of them are a billion dollars or bigger and we are working on projects now that go from five to twenty billion dollars and so these projects can have budgets larger than several countries' total GDP.

If you visualize around the world where there is major infrastructure being built, that is where we are. In the middle east, although we don't work in Iraq, but we do work in the Persian gulf in Doha and in Qatar, around Abu Dhabi and Saudi Arabia.. We work off the west coast of Africa where there is a lot of oil and we work in southern Africa in mining, and we work in Australia in oil and gas and mining and also Asia in oil and gas and mining. In North America and Europe, our work is more mixed, and includes oil and gas, construction, mining and manufacturing. We work with pharmaceuticals and semi conductor manufacturers, but those are mostly on their capital expansion projects. We are beginning to get some interest from their operating sites as well. A lot of our work is in heavy industry, and a lot of that is in the extracting industries – gas and mining, taking substances out of the earth – primary industry/resource extraction. Of course, that's a bit of an overgeneralization, but it's a big piece of the work we do.

The important thing to say about our work and the way it has evolved over the last 10 to 15 years especially, is that we have gravitated from project execution and leadership team alignment towards high-performance safety, which is really about making sure on these major capital projects that people don't get hurt. Not only that they don't get killed but that nobody gets hurt. This involves a fundamental transformation in the thinking, beliefs and ultimately actions of all the people involved in the project – to shift from a mindset of keeping your accidents within an "acceptable" range to a commitment to the elimination of all accidents and injuries. If you can imagine the size and complexity of the projects, you can see how that can be a major undertaking.

JR: *That is where I remember us first getting in touch. I encountered you on a list serve and you were looking about having someone work with you while you were finishing your dissertation. You were doing primarily safety prevention work, not accident reduction, using an explicitly integral framework.*

RS: Yes that's right.

JR: *What kind of foundation in the practice at JMJ existed that helped enable you to stretch it into a more integral approach?*

RS: That is a great question. I think that there was a good foundation already in place to be able to build an integral framework onto. It was never about replacing what JMJ did with integral but about actually expanding and building a more integral approach to what was already occurring here, building on the successes. The roots of JMJs work were based in the transformational approach that had grown out of the human potential movement. That approach was explicitly designed to shift people's relationship to work and to life in general from one in which results were generated from merely working harder to one in which results were understood as a function of how the world occurs for people. In other words, it had a strong constructionist element, and its strength was that the approach reoriented people from a mindset wired for extrinsic motivation, objectivity and prediction to one of intrinsic motivation, interiority, and unpredictable outcomes. It gave dignity to the subjectivity of human beings and focused on the process of human meaning making as the source of unimaginable creativity and breakthrough.

JR: *So as you say the foundation was there. What kind of work did you do then to help take it to the next step?*

RS: The work at JMJ was grounded in transformational work, and more explicitly Heidegger, phenomenology, constructionism, and a particular kind of linguistic orientation. Because of that, the language in the approach could get very bogged down with jargon, which from the client's perspective could sound pretty bizarre; we at JMJ referred to it as a practical ontology, to keep it brief. That is accurate and it is an interesting way to say it, but when you say that to a client then you have to say a whole lot more to explain what you mean by it.

JR: *I am a bit familiar with that as Steve March applied that approach in his work.*

RS: He did. He worked with Fernando Flores' models a bit, who was somebody who also contributed to the transformational consulting school and also drew heavily from Heidegger. It is a very powerful methodology and there's a lot you can accomplish with it but you really can get bogged down in the terminology if you're not careful. So bringing in the integral approach in the beginning was really more about simplifying and making a more elegant presentation of the same basic ideas. So rather than talking about a "world occurring," we can shorten that to a right hand, left hand conversation where the right hand is the world of facts and measurements and the left hand is the domain of values, interpretations, meanings, etc.

JR: *I remember Steve March describing a kind of communication ontology that they were successfully using but it did sound like a lot of work and a lot of education to get people into the lingo and the jargon.*

RS: It takes a lot of work. So for example in that school we would talk a lot about *being* versus *doing* and the *being of human being* as the source of new thinking or possibility. The conversation was a way of shifting a person out of the conventional mode of thinking and into the realm of possibility. The trick was to get beyond the mere concept of possibility and to experience possibility as the source of new action. Again, if you get into Heidegger's work you can see how that can take you into genuine depth but it can also take you out of the world where everyday people live and work. It is just so much more elegant to talk about four quadrants, one half being the objective world and the other half being the subjective world. So it is so much easier to distinguish the importance of the relevance of the interiority using the four quadrants model. You could get more done with less work. We found both at JMJ among our consultants and with our clients that the four quadrant model itself is a very sticky idea, the stickiest among all of the integral and transformational models. This is because the primary way it gets used is right hand/left hand and when you do that most clients very easily get that their default orientation is so right handed and so objectivist, and if they really want to create new thinking and possibility or they want to cause something new to happen and it wasn't going to happen otherwise, that it is through the subjective world, through interiority, that they are going to get to something new and extraordinary. Almost universally, people acknowledge that they are weak in their relationship to interiority, especially when it comes to work. They don't want to be weak there and they acknowledge that they need help. That's really our entre with the client. I think with our consultants the more facile they got with the conversation, the more they just started to jettison the old jargon intensive ways of talking about it. It was actually the way integral started to get some traction.

JR: *And how long did it take before you got that more streamlined elegant presentation and you jettisoned the old approach?*

RS: I would say it is still happening. I mean there are still consultants who will flip over to the three circles way of talking – be/do/have – which is from the old school and some of them are able to mix and match both and some of them actually never learned the three circle version and they just go right to the four quadrants. But I think there are people who have picked it up really quick, within the first six months, and they just started adapting it. But I think it took probably good six or seven years for it to become the way we do it. So JMJ used to talk about ourselves as a transformational consultancy, then it was a transformational and integral company – integral was in the background. Now that has flipped and I think our self identity as a company is that we are an integral company and that we have a tool set that includes some transformational elements. I'm saying that as if it's true for everybody and that's clearly not the case, but I think it's that way for most.

JR: Changing culture takes time.

RS: It does and if you look at our consultant population and if you were going to do a psychograph, we are like a lot of consultancies; we have people whose center of gravity is clearly postconventional, or "integral," we have people who are a low integral or just on the threshold, we have got people who are clearly achievers, both on the high and low end of that scale. I don't think there are many consultants who are in the low conventional range but there might be a handful. So it is an interesting thing that is going on where you have people who are coming from all different mindsets who are using the integral approach and using it in different ways.

JR: This reminds me of the distinction that you turned me on to, between people who were able to think in an integral way and other people who were integrally informed. The latter had adopted the model and it held them and allowed them to follow the "code book" so to speak of integral to enact those things.

RS: Yes, for them it's a map. If you are integrally informed you get the map and you can pull it out and it can actually help guide you in significant ways. We have people who are clearly at achiever level who use the four quadrants very effectively, and they use it in an achiever way. We have now introduced developmental levels. I think this was another significant transformation in our company was to go from an orientation where transformation itself was considered bimodal, you are either transformed or you are not, you either got it or you didn't get it. That was the way a lot of people related to it. So bringing in developmental levels introduced the idea of transformation as creating a journey rather than as a destination. That was very gradual, but it definitely has shifted not only the way we relate to integral itself but the way we address our clients. I think probably 10 or 15 years ago our work with clients was much more coercive. That is kind of a negative way to say it, but we would work with a client to have them commit to some goal and then we would have them get that in order to accomplish something significant you actually had to address who you are being as a leader in order to get there. So in other words you got to bring interiority to it. Then the consultant's job as a coach was to make sure that that client didn't give up on their commitment, that they were in full integrity with what they committed to doing. We held them over the fire so-to-speak to ensure they got the result that paid us for. That worked, but it could have a negative side effect sometimes, which was to burn people out. But as the developmental levels came in I think we softened and gradually realized that for our clients accomplishing something is more of a journey and there is less judgment in it. We saw that it's not good to sacrifice yourself completely to get this goal and leave yourself without resources for tomorrow's goal.

JR: *I think what you describe has been typical of the whole process of integrating the integral viewpoint. At first we are proselytizing and you are either in the club or you are not, and only eventually do we grow into a more mature approach that recognizes that we are all growing and we are all at various places and how can we use what we know to facilitate and assist that growth at any place.*

RS: (Laughter). That's exactly right. This is one of the things I learned a few years ago about myself was that after I had been through a couple of significant transformational events and workshops, and I came out the other end and I felt like things were never going to be the same again. But then realized about 3or 4 months later, this was my big revelation, that my ego survived my transformation. (More laughter) And that the same is true at integral. A lot of people who come into it, myself included, have this revelation, sort of like amazing aha experience, that you are in the club now and you look around and you feel like you've reached this place where you have finally found the other swans. Then after a while you realize "oh God, you know the ego survived this as well". And what happens is the ego starts to use integral to convince itself that it has improved.

JR: *It reminds me of what David Bohm notes in* Thought as a System, *that the defenses around the image of self and the world will find a way to incorporate any insights that may be genuine and transformative, but it will incorporate them and reduce our world down to its model of those insights rather than any genuine transformative ongoing process.*

RS: Exactly. I think it's one of the interesting things about this work of consulting and using the integral approach for consulting. Because you know in order to be in business in this way the tools themselves have to be very instrumental, they have to produce results, the results have to be measurable, there has to be business impact. In some sense you realize that this is just another set of tools for doing business as usual, I mean it could be that. I have to remind myself from time to time that no matter what toolset you are using if there is a transformational element in them and I think that it really is in this case, it is a little like playing Johnny apple seed, where you have to make sure that the work makes a difference for clients and that the clients get that as real value. And at the same time there is this little subversive intention that once the seeds of transformation is planted in the client and in the client's organization that it might just take root and that from time to time a person may wake themselves up and find deeper significances in what they are doing, and find that they are more than their job, that who they are is more than their ego, more than the results that they get. So there is a kind of two edged sword nature to this. But you just can't start taking yourself too seriously or you will kill the seed and you won't get the result the client is buying.

JR: *I see that as well in the teaching I do. What we hope for is that at some point the seed will germinate and produce a crack in the person's world and suddenly some light will leak in and or they will stick their head up and they will say, oh things aren't quite what I thought they were.*

RS: It can be a little bit disorienting for a while. Interestingly, after that happens, nine times out of ten that person wants to come to work for JMJ (laughter) because they realize "this is so cool, this is what I want to do."

JR: *So my understanding is that in addition to the focus on these large capital projects and the safety orientation of them, that you also begun to move into the area of leadership development.*

RS: Yes.

JR: *How did that come about and what are you able to do, or how do you approach doing that for clients.*

RS: Leadership development is a key part of any work we do, whether it is safety related or whether we are doing a large intervention that's more traditional OD type work, or a major capital project, team building, execution or anything like that. There is a lot that we can say about leadership in general, but I would say the light went on for me about leadership when I was reading Robert Kegan's work *In Over Our Heads,* because I was looking at really trying to understand the attributes of the different developmental levels or mindsets and I was really honing in on Kegan's fifth order, which is his version of postconventional thinking, or integral level. I was trying to understand the attributes of that level and when he was describing leadership at that level he was pointing to Ron Heifetz, and said that Heifetz's work was the only work that he knew of that explicitly dealt with the developmental requirements of leading at that level. Everyone else that talked about complexity and dealing with complex leadership took it for granted that if you were cognitively bright you could lead at that level, and that it could be taught. Heifetz was the only one, and of course Kegan as well, talking about adaptive leadership. Or, in other words, postconventional leadership had an explicitly developmental component.

JR: *That your way of thinking has to evolve and adapt to the situation, so the leader's job was to create that holding environment for people to do that developmental work.*

RS: Right. So that distinction between technical problems and adaptive problems seemed to me incredibly relevant to the kind of work that our clients were facing daily. So you can use safety as an example, and the complexity of a multimillion dollar project is a specific case of an adaptive challenge. The project manager and the management team is faced with eliminating injuries on a major project where you've sometimes got 20,000 to 40,000 workers from all different nationalities, different religions coming in from all over the world, lots of pressure to deliver on schedule, on time, and on budget, but how do you do that without hurting a single person? Well we felt that the biggest problem or the biggest failure was that they were trying to apply what they already knew. They were treating the situation like it is a technical problem. If they just got more safety glasses or enough hard hats that that somehow would do it. What they actually had to do was that the leaders themselves had to lead the learning at the organizational level – in other words they had to accept that it is an adaptive challenge and that they didn't already have the answer. We saw that this idea resonated in case after case after case. So we started to explicitly bring that work into our safety practice and other parts of our work. So it's a kind of underhanded integral approach to leadership that has become embedded in all of our engagements. For every major engagement we will form a leadership team and take them through a mini-leadership course with Heifetz's distinctions underlying it.

JR: *I had the pleasure of seeing Ron in Prague at the ILA conference do a couple of different events and I was also at a round table with him in Vancouver a couple years ago where he worked for a couple of hours for a group of about 8 of us, so I am certainly a fan of his work.*

RS: Fabulous. I think there have been lots of variations and different ways of interpreting that work. He has been around for a while now, yet in industry we are still introducing him for the first time.

JR: *When I was in the doctoral program at Gonzaga the conceptual framework was around his* Leadership Without Easy Answers *work.*

RS: Yes, it is a kind of foundational text for our consultants. There are a couple of foundational texts really. We have them read Wilber, we have them read Kegan, we have them read Heifetz's *Leadership Without Easy Answers* and there is some basic safety literature. I would say those people are really the foundations of the integral part of our work and those things supplement the courses and papers we've created that articulate our transformational toolkit.

JR: *Another question occurs to me as you say that. I have this experience of have graduate students and or masters of organizational leadership students reading these things and what I see is that simply reading it is kind of like scattering seeds like a shotgun effect and hoping some of them will take root. So given that these consultants are the people you are using internally to deliver the results to the client, what kind of things have you done internally to help those seeds take root? How do you help both those who naturally pick it up and can run with it to really go, but also to those who maybe need to be held by those frameworks? How do you help them to use it in an appropriate way with clients?*

RS: One thing we did was we designed a course called the Power of Being and the Practice of Transformation, which incorporates the Kegan four column exercise and some of the transformational elements of our work and a little bit of Heifetz. It is about a three day course and we run in all of our business units around the world. We did it last year three times, but we just keep running the course and put people in it experientially. Because what you are alluding to is that reading the material doesn't put you in the hot seat of personal development or of transformational consulting. We really want people to have the experience of being able to see their own frames of reference or their own mindsets and get beyond them. You can't really help somebody else experience shifting from subject to object of awareness without going through that in your own experience. So we run these courses over and over and we try to embed those kinds of exercises into all kinds of development activities. You can't lead transformation until you understand the mechanics of it in yourself. Most people get there. We have had consultants who go thru that exercise, resist it and eventually leave the company, and that is not always a bad thing.

JR: *It helps them understand if this is a good fit do for them or if it is better for them to be somewhere else. I'll send you a short chapter that my doctoral student and I submitted to a Jossey-Bass book that ILA is doing that summarizes a similar kind of work we are doing here. We use the TLC 360 to create a little midlife crisis then run them thru the immunity to change work.*

RS: Fabulous, I'd love to see that. One other thing I'd like to mention is on this thread of integrating integral more readily into our consulting and how we use it with our clients. About three years ago we chose as a strategy to develop a set of integral assessment tools and we have now probably about ten different variations of an integral assessment. Including ones for projects and organizations, safety, leadership team, and individual leadership versions. We were able to sell this idea of measuring performance integrally, or at least through quadrants, levels and developmental lines. Our largest client decided they wanted this in all of their work, and what that forced is that all of our consultants who deliver for that client now have to become facile enough with quadrants levels and lines and the analysis of it to adequately deliver that tool with this client and any other clients that want it. This again was a subversive way selling something that our clients want then having our consultants develop in order to meet the delivery.

JR: *The clients say they want it so you had better be able to deliver!*

RS: Exactly right! We are about three years into it and we are starting to get a lot of traction with it. It is doing what I hoped it would, which is that a consultant which may not have been that interested in the more advanced integral tool kit up until now has gotten more interested. There is work in front of them that requires them to learn it. So it is pulling for a lot of additional development in that way.

JR: *So it is a kind of natural evolution, which is great.*

RS: I don't know if it's natural!

JR: *Well, as you describe it one thing leads to another.*

RS: (Laughter). It feels a little bit forced at times.

JR: *So you say that having developed this set of integral assessment tools you are getting traction in terms of client interest and motivating your consultants to develop themselves* *in these tools and the integral framework. Have these assessment tools also enabled you to quantify the benefits of your work for clients? In other words, can you point to bottom line benefits clearly enough that clients' get interested?*

RS: First, it enables us to quantify perceptions and that gives us a baseline to work with in measuring value shifts. It also enables our clients to see the places where they need to go to work to shift their culture and practices. We have not yet correlated our integral assessments bottom line business results in but that will come.

JR: Ok. Do you have an idea of what it will take to get that correlation made?

RS: We have to have enough data across several projects to give us a broad picture. We almost have that now and the number of assessments we're doing is increasing rapidly, so it won't take much longer. Then we need to hire a crack psychometrician to run the statistics. It's not that hard for someone that like. I've pretty much forgotten what I learned in my applied statistics classes, so I won't be doing that work. Besides, I'm drawn to the qualitative side of things.

JR: I look forward to hearing about that at some point. For now, thank you for taking the time to share your insights and experiences.

RS: You're welcome, it has been fun.

Weltanschauung und Politik in den heutigen USA. Barack Obama und der „neue Kulturkampf“ um die Führung der anglo-amerikanischen Weltmacht

Roland Benedikter[1]

The relationship between Worldviews and Politics in the USA today. Barack Obama and the "new cultural battle" for political supremacy in the US

English Summary: This article provides an analysis of the current relationship between Politics, Culture and Worldviews in the USA under Barack Obama. The present "great Obama divide" of US domestic politics consists in the division between institutional and contextual (cultural and worldview) politics. Obama has induced their current opposition when he ran for the US Presidency by profiling himself as a "cultural" candidate "against the system". One result is that by becoming part of the system after being elected, Obama has lost some of his initial "revolutionary" appeal; a second effect is that the opposition is now trying to turn the tables by mobilizing the contextual political sphere against Obama’s control of the institutional power. In fact, the Republicans, rather than concentrating on traditional ways of regaining power focus on launching a new "worldview" battle against Obama in the hope to use the pre-political sphere to eventually regain the institutional political majority. The overall result is a general climate of "worldview mobilization" in the USA, and an increased influence of cultural and worldview philosophies onto the institutionalized mechanisms of politics. Pre-political movements like the conservative "inverting the myth - inverting the paradigm" movement or the "tea party" movement are the expression of attempts towards a new "cultural battle" for "the soul of the USA," which has to be understood in its basic mechanisms, if the "Obama constellation" shall be understood. This article sketches some core elements of Obama’s worldview that are in play in this game, and it argues that many actions of Obama on the field of foreign politics are (and will be) to a noticeable extent co-oriented toward influencing the domestic "worldview battle."

Im Januar 2010 ging Barack Obamas erstes Amtsjahr, von so vielen Hoffnungen begleitet, zu Ende. Sein zweites Amtsjahr begann vielversprechend mit dem Erfolg bei der Gesundheitsreform Ende März 2010. Doch trotz dieses Erfolges sind Obamas Zustimmungswerte in der ersten Hälfte seines zweiten Amtsjahres auf unter 50% gesunken. Er ist damit der Präsident der vergangenen 50 Jahre, der am Beginn des zweiten Amtsjahres die niedrigsten Zustimmungswerte aufweist, und ausserdem derjenige, der den absoluten Rekord im

Verfall von Zustimmungswerten in der kürzesten Zeit aufweist. Bis auf den mühsamen und äusserst knappen Abstimmungserfolg bei der Gesundheitsreform - zugegebenermassen ein Jahrhundertprojekt in der Nachfolge Ted Kennedys - kamen die meisten seiner Vorhaben bisher nicht so recht vom Fleck. Die Frage stellt sich: Wo liegen die Gründe für Obamas Krise? Und: Welche Macht hat er wirklich? Ist er - mehr als seine Amtsvorgänger - öffentlicher Meinung und Klientel-Interessen ausgeliefert, die sich bekanntlich rasch wandeln? Vor allem aber: Welche Rolle spielen kulturelle und weltanschauliche Aspekte in der heutigen innenpolitische Lage der USA? Und wo steht Obama dabei?

Das Damoklesschwert der Begeisterung

Obama ist ein Präsident, der gerade wegen der Begründung seiner Politiken auf Hoffnung, Wandel, Idealismus und Ideale mehr als andere von der „Gnade des Augenblicks“ und von der „Gunst des Publikums“ abhängig ist. Eine Gunst, die sich in der ersten Hälfte seines zweiten Amtsjahres gegen ihn zu wenden scheint. Die Begeisterung schwindet, und damit schwindet seine wichtigste Legitimationsgrundlage. Sein Vorgänger George W. Bush hatte diese Begeisterung nie, also war er auch nie von ihr abhängig. Obama wusste zwar von Anfang an um die fundamentale Zweischneidigkeit seines überwältigenden öffentlichen Zuspruchs. Doch er weiss heute deutlicher als zuvor, dass die öffentliche Meinung in seinem Fall - dem Fall eines „Ideenkämpfers“, der mit der Macht der Inspiration in das Amt kam - besonders einflussreich über Erfolg oder Misserfolg entscheidet. Und er weiss, dass damit kontextuelle Politikfaktoren aus dem vorpolitischen Feld, oder pointierter ausgedrückt: dass die im erweiterten Sinn „geistige“ Dimension sowohl seine größte Stärke und Kraftquelle wie auch seine wichtigste Achillesferse und Angriffsfläche ist.

Man hat den Eindruck, dass Obama deshalb inzwischen stark auf Durchhalteparolen setzt, die zum Teil fast trotzig klingen. So wie Mitte Januar 2010 zum Beispiel: „Besser eine Amtszeit lang ein guter Präsident, als zwei Amtszeiten lang ein mittelmässiger.“[2] Derartige Durchhalteparolen, die er auch anlässlich der programmatischen Ankündigung seiner Arbeitsschwerpunkte für das zweite Amtsjahr - Arbeits- und Beschäftigungspolitik, Afghanistan - am 27. Januar äusserte, sind nur die Bestätigung für eine unerwartet schwierige Lage, die unerwartet früh eingetreten ist.

Sie zeigen, dass Obama inzwischen tatsächlich mit einem Scheitern nach bereits einer Amtszeit rechnet. Die Gründe dafür sind vielfältig, liegen aber bei genauerer Analyse weit eher im vorpolitischen und kontextuellen: das heisst im in erweitertem Sinn „weltanschaulichen“ Politikfeld denn in der institutionalisierten, normativen Politikebene. Inwiefern?

Berücksichtigt man Obamas überproportionale Abhängigkeit von öffentlichem Zuspruch, Kulturpsychologie und weltanschaulicher Zeitgenossenschaft, dann wird deren allmähliches Versiegen - also der Virus in der „Software“ seiner Präsidenschaft - zu einer realen Gefahr für seine weitere Amtszeit.

---

[2] B. Obama, zitiert nach: M. Kilian: Barack Obama hat lieber eine gute als zwei mittelmässige Amtszeiten, sagt er dem Sender ABC News. In: Tagesanzeiger Zürich, 27.01.2010.

Dazu kommen zusehends komplexe und vernetzte Probleme in der politischen „Hardware“ seiner Präsidentschaft - wie etwa die Blockaden seiner Vorhaben betreffend Gesundheits- oder Wirtschaftsreform oder die Niederlage bei der jüngsten Nachwahl des vakanten Senatssitzes des verstorbenen Ted Kennedy am 19. Januar 2010 im Staat Massachusetts, zuvor 50 Jahre lang Hochburg der Demokraten. Die Republikaner haben damit eine sogenannte „Sperrminorität“ im Senat erlangt und können den Präsidenten mittels Obstruktionspolitik nun zusätzlich behindern.

Langfristig vielleicht am wichtigsten aber sind für Obama die sich häufenden symbolischen Niederlagen – das heisst Niederlagen genau auf seinem eigenen Kompetenz- und Stärkefeld, das ihm 2008 den Sieg über die Republikaner eingebracht hat. Darunter war zuletzt zum Beispiel das Scheitern der Durchführung der Terrorprozesse gegen Khalid Sheikh Mohammed und andere vier Angeklagte wegen der Terroranschläge vom 11. September 2001 in New York. Obama hatte als amtierender Präsident die Verlegung der Prozesse von einem Kriegsgericht an ein Zivilgericht am Ort der Anschläge politisch und argumentativ stark forciert, um den versprochenen „Wandel“ auch in der Art der Terrorbekämpfung symbolisch zu vermitteln. Er hatte dabei in Übereinstimmung mit seiner liberalen, progressiven und integrativen Geistesart eine symbolisch zu verstehende doppelte Programm-Botschaft an die eigene Gesellschaft, aber auch an die Welt vermitteln wollen: einerseits eine neue „Zivilisiertheit“ und Grosszügigkeit der USA, die mit dem Habitus des „kriegerischen Idealismus“ der Bush-Ära brechen; andererseits eine Abwertung der Terroristen von „feindlichen Kämpfern“ zu gewöhnlichen Verbrechern.

Die Stadt New York lehnte aber Anfang Februar 2010 die Durchführung der Prozesse aus Sicherheits- und Kostengründen ab, weshalb diese, was erhebliche Verspätungen und Kosten bedeutete, erneut an ein Sondergericht auf einer US-Militärbasis beziehungsweise in einem Gefängniskomplex verlegt werden musste, was Obama zähneknirschend akzeptieren musste.[3] Man muss dies in einer Präsidialdemokratie wie den USA als deutliche Demütigung des amtierenden Präsidenten ansehen.

Insbesondere bei derartig symbolisch-„kontextuell“ stark rezipierten - und von den Republikanern mit allen medialen Mitteln 24 Stunden pro Tag ausgenutzten - Niederlagen wie dieser riskiert Obama zusehends sein Gesicht. Was er sich zweifellos einige Male erlauben kann, was sich aber in der ersten Hälfte des zweiten Amtsjahres derart überproportional häuft, das es bei weiteren Fällen zu einem ernsthaften Problem für seine weitere Amtszeit werden kann. Zu einem Problem nämlich, das ihm aus seiner eigenen Bastion heraus: aus der vorpolitisch-kontextuellen Ebene heraus derart schadet, dass er politisch instabil wird.

Diese Gefahr steht derzeit real im Raum. Sollte Obama, wie es sich angesichts seiner aussergewöhnlich niedrigen Zustimmungswerte im ersten Drittel 2010 abzeichnet, im Spätherbst 2010 auch die „Halbzeitwahlen“ (midterm elections) zum US-Kongress verlieren, die von der US-Verfassung bewusst zur Halbzeit der Amtszeit jedes Präsidenten angesetzt werden, um diesen unter Leistungsdruck zu setzen und ihn neu zu motivieren, und bei denen etwa die Hälfte aller Abgeordneten zur Wahl steht, dann steht eine zweite Amtszeit Obamas bereits zur Disposition. Dazu muss man wissen, dass der amtierende Präsident diese Wahlen fast immer verliert, weil der US-Wähler nach zwei Amtsjahren meist die Opposition stärkt, um eine gegenüber dem Wahltag größere Balance zwischen Präsidial- und Parlamentsmacht herzustellen.

Interessensgruppen hinter den Kulissen

Es scheint zusammenfassend ein Paradoxon zu sein: Gerade der am meisten bejubelte und mit den größten Hoffnungen und Vorschusslorbeeren versehene Präsident seit John F. Kennedy, Barack Obama, erlebt seit einigen Monaten die größten Verluste und die schmerzhaftesten innenpolitischen Niederlagen aller US-Präsidenten der vergangenen fünf Jahrzehnte. Wie konnte es nach der unvergleichlichen Anfangs-Euphorie um ihn zu dieser Situation kommen?

Wichtig ist zunächst zu sehen, daß die meisten von Obamas Vorhaben bisher weniger von aussen, als vielmehr von innen blockiert wurden – in wesentlichen Teilen sowohl direkt wie indirekt von seinen eigenen Anhängern und Parteifreunden. Beobachter sprechen bereits davon, dass Obama von denselben Interessensgruppen, die ihn an die Macht gebracht haben, nun „verraten" wurde. Was genau ist damit gemeint? Und: Welche Rolle spielen Interessensgruppen hinter den Kulissen derzeit grundsätzlich in den Vereinigten Staaten?

Die Systemrationalität der USA steht seit jeher zwischen Interessensgruppen, Politik und „Geist". Klientel-Interessen sind hier immens wichtig. Dies nicht zuletzt deshalb, weil die USA viel stärker als Europa auf das Prinzip von Selbstverantwortung und Eigenleistung bauen: „Kümmere Dich selbst darum, dann verdienst Du es auch, dass es gelingt". Das macht Lobbyismus: das Sich-Kümmern um eigene Interessen, hier zu einer öffentlich anerkannten Arbeit, während sie in Europa eher einen zweifelhaften Ruf hat.

Ein zweiter Grund ist, dass „vorpolitische" Faktoren wie Kulturpsychologie, Weltanschauung, philosophische Gedankengebäude und Religion in den USA einen viel stärkeren und direkteren Einfluss auf die normativ formalisierte Partei- und Institutionenpolitik haben als in Europa - und diesen auch geltend machen. Die Obama-Administration macht in dieser Hinsicht keine Ausnahme. Im Gegenteil: Sie ist sogar entscheidend durch die Mobilisierung vorpolitischer und kontextueller Politiken an die Macht gekommen.

Doch wenn vorpolitische oder „kontextuelle" Politikfaktoren - das heisst: eine Idee, eine Ideologie, eine Weltanschauungsbeschwörung, ein Ideal, ein richtungspolitischer Kulturansatz, eine Kulturpsychologie des Aufbruchs und der Begeisterung - einen vergleichsweise großen Einfluss auf die normativ geordnete Politik und ihre Institutionen haben wie unter Obama, so hat das Vor- und Nachteile.

Der *Vorteil* ist, dass das gesamte System ideenoffener wird, dass es einen höheren Anteil an Idealisierung aufweist und dass es Flexibilität zu relativ raschem Wandel erlangt.

Der *Nachteil* ist, dass es dadurch überproportional anfällig für den Wandel der öffentlichen Meinung wird. Vor allem aber, dass es tendenziell den professionellen weltanschaulichen „Meinungsmachern" im vorpolitischen Bereich der Medien erlaubt, einen viel wirkungsvolleren „ideologischen" Druck auf die Politik zu entfalten.

Genau letzteres ist heute der Fall. Es ist der entscheidende Grund für Obamas Krise. Obamas Krise kommt letztlich nicht aus der im engeren Sinn politischen Sphäre, sondern aus der Veränderung in der öffentlichen Vernunft Amerikas.

Wie kann man das verstehen?

Der neue Weltanschauungskampf in den USA: Die Mobilmachung des vorpolitischen und kontextuellen (einschliesslich des kulturellen) Politikfeldes gegen Obama

Für offene Gesellschaften gilt: Ideenkraft und Normen müssen sich in einem ausdifferenzierten Gesellschaftsorganismus die Waage halten, sonst wird das Ganze instabiler als nötig. Das haben uns die wichtigsten gesellschaftspolitischen Vordenkerinnen und Vordenker des 20. und 21. Jahrhunderts gezeigt.

Bei Barack Obama aber war die Kraft der Ideen derart ausschlaggebend für seinen kometenhaften Aufstieg und die Machtergreifung, dass ihr allmähliches Versiegen nun zu seiner größten Gefährdung wird. Die Legitimation und Macht des Amtes, also die normative Ebene, ist ihm daher weit weniger hilfreich als seinen Vorgängern – eben, weil er als „Ideenmann“ gilt: als jemand, der sich im Wahlkampf ausdrücklich als „vorpolitische“, als „kontextuelle“, als „geistige“ Kraft „gegen das etablierte politische System Washingtons“ profilierte – und damit gewann. Diese strategische Konstellation wendet sich nun gegen ihn.

Warum?

Weil Obama mit dem Amtsantritt am 20. Januar 2009 zwangsläufig selbst zum wichtigsten Systemvertreter geworden ist. Damit hat er in der unbewußten Empfindung der Öffentlichkeit „die Seiten gewechselt“. Er wurde vom „vorpolitischen“ Geistes-Kämpfer gegen das normierte System zum alltäglich medial präsenten Systemvertreter. Dadurch verlor er nach und nach seinen geistigen „Appeal“.

Das nutzen die Republikaner aus. Sie versuchen nun, Obamas ehemaligen Stärkepunkt unter ihre Kontrolle zu bringen: Die kontextuelle, kulturelle, „geistige“ Dimension. Oder wie es der republikanische Präsidentschaftskandidat 2008 Mike Huckabee ausdrückte: Die „Weltanschauungshoheit muss zurückgewonnen werden. Dann werden wir auch wieder politisch siegen.“[4] Das ist der Schlüssel zum Verständnis der heutigen Situation. Was wir heute in den USA haben, ist eine tiefe gesellschaftliche Spaltung, welche durch die Mobilmachung weltanschaulicher Dimensionen gegen Barack Obamas Präsidentschaft bestimmt wird - also durch den Kampf zwischen vorpolitisch-kontextuellen und normativ-institutionalisierten Politikdimensionen. Ein Beispiel?

Führende Republikaner wie etwa Mike Huckabee oder Newt Gingrich haben sich nach der Präsidentschafts-Wahlkampfniederlage im November 2008 in die Bild- und Internetmedien, vor allem das Fernsehen zurückgezogen. Sie haben dort eigene Talk- und Meinungsshows, die fast täglich gesendet werden. Sie machen von dort aus nun täglich Stimmung gegen den Präsidenten und seine Politiken. Sie stilisieren diese Stimmungsmache – und genau dies ist entscheidend, um die Logik hinter den Kulissen zu verstehen, welche die heutigen USA prägt – nicht als einen politischen oder themenorientierten, sondern vielmehr als einen Weltanschauungskampf: als einen „geistigen“ Grundsatzkampf um die Ideale der USA an sich, um die „Seele Amerikas“. Es ist ein Kampf, der vorgibt, von Idealen, Religion, Spiritualität entscheidend mit impulsiert zu werden. Sie werden von zahllosen „rechten“ Meinungsmachern unterstützt, darunter Charles Krautmacher, Glenn Beck, Sean Hannity, Bill O’Reilly, Greta van Susteren, Rush Limbaugh, oder dem noch immer aktiven Oliver North, der längst zu einer Ikone der Republikaner geworden ist. Sogar der Harvard-Geschichte-Professor und für die USA einflussreiche Theoretiker des britischen Empires Niall Ferguson tritt in letzter Zeit immer öfters kritisch gegen Obama an die Öffentlichkeit.

---

[4] M. Huckabee, in: The Huckabee Report Online, http://www.mikehuckabee.com/, January 17, 2010.

Ein weiteres Beispiel unter vielen, die insgesamt allerdings System haben: Es gibt hier seit Obamas Amtsantritt eine eigene „kulturelle“ Bewegung mit zivilgesellschaftlichem Anspruch, die „Inverting the Myth – Inverting the Paradigm“ Bewegung heisst, also: „Stelle den Mythos und damit das Paradigma auf den Kopf“. Damit ist gemeint, dass Obamas Mythos mittels Offenlegung der Schwächen seiner Weltanschauung auf den Kopf gestellt werden soll. Diese „vorpolitische“ Bewegung betreibt täglich qualitativ gehobene „philosophische Hetze“ gegen Obama, und zwar nicht nur auf dem traditionell republikanernahen Informationsnetzwerk „Foxnews“, sondern auch auf angesehenen Bildungs- und Kulturkanälen – mit bereits heute weitreichenden Erfolgen auf das Wahlverhalten der Amerikaner, wie die letzten Zwischenwahlen gezeigt haben.

Dazu kommt bereits seit dem Amtsantritt Barack Obamas die neue rechts-konservative „Tea-Party-Bewegung“, eine Bürgerbewegung, die sich aus verschiedensten Einzelorganisationen zusammensetzt. Sie veranstaltete im Februar 2010 ihren ersten nationalen Kongress und will Obama ebenfalls aus dem vorpolitischen Feld heraus mittels einer „weltanschaulichen Offensive“ zu Fall bringen. Sie wirft Obama eine „unmoralische“ Politik vor und verspottet ihn als trockenen Jura-Professor, der nicht das Zeug zum „Oberkommandierenden“ habe. Nicht politische Angriffe gegen Entscheidungen und ihre Grundlagen stehen in ihrem Zentrum, sondern „geistig-ideelle“ Angriffe *ad personam*. Eines ihrer öffentlichen Zugpferde ist die ehemalige Präsidentschaftskandidatin Sarah Palin, die nie versäumt, Gott gegen Obama ins Feld zu führen – darunter mit dem Hinweis, daß „Gott selbst“ die Ölpipeline in ihrem Heimatstaat Alaska gebaut haben wolle, was ausschlaggebend sei, weil Menschen ein solches Riesenwerk von sich aus nie zustandebrächten. Palin hat mit solchen Botschaften bei der konservativen US-Wählerschaft Erfolg. Es handelt sich bei der „Tea-Party-Bewegung“ ebenfalls um einen klassischen Versuch der Wendung kontextueller gegen institutionalisierte Politik.

Ein solcher direkter Zusammenhang zwischen Weltanschauungsdebatte, Philosophie und Politik wäre in Zentraleuropa freilich nicht nur undenkbar, sondern politisch inkorrekt. In den USA ist dies aber das ausschlaggebende Zentrum der Debatte. Der Kern dieser „right spirit“ („richtiger Geist“ oder „richtige Einstellung“) Debatte geschieht zwar nur mit Worten. Aber Worte sind in den USA eben aufgrund des Grundsatzverhältnisses zwischen ideellen und institutionalisierten Politikfaktoren viel wichtiger und einflussreicher als in Europa, wo politische Reden oft als „Gerede“ empfunden werden. In den USA dagegen schaffen sie wirklich

Realitäten. Dies nicht zuletzt deshalb, weil dieses Land - im Gegensatz zu Europa - von Anfang an eine Demokratie war.

Das Schlüsselmotiv der gegenwärtigen US-Innenpolitik: Die Wendung von Obamas Siegesstrategie gegen ihn selbst

Doch war das nicht gerade Obamas eigene Strategie: vorpolitische und kontextuelle Politikfaktoren wie Psychologie, Kultur, Ideen, Ideale usw. gegen die herrschenden, „normativ“ erstarrten Politikverhältnisse zu wenden - also Weltanschauungsfaktoren gegen das institutionalisierte Politiksystem? War das nicht gerade seine eigene Strategie, mit der er erfolgreich war?

Das war in der Tat der Fall. Eben genau dies ist der entscheidende Punkt, um die heutige Konstellation in den USA zu verstehen. Das verhältnismässige Übergewicht kultureller und kontextueller Politikfaktoren über normative Politikfaktoren, das die Republikaner heute bewusst medial fördern und gegen Obama ausnutzen, um gegen ihn mobil zu machen, ist massgeblich auch Obamas eigenes Werk, das sich nun gegen ihn wendet.

Alles hat mit der Art begonnen, wie Obama den Präsidentschaftswahlkampf 2007-08 geführt und gewonnen hat: Neue Ideen gegen eingefahrene Institutionen. Damit hat er aber einen gefährlichen Präzedenzfall geschaffen: Ideen gegen die staatlichen Institutionen ins Feld zu führen. Das war so in der US-Geschichte eigentlich niemals der Fall, weil – im Gegensatz zu Europa – in den USA der Staat nicht gegen falsche Ideale, sondern aus den „richtigen“ Idealen heraus entstanden ist, dort also Ideale der Freiheit, der Menschenrechte und der Individualität ursprungsgleich und eins mit dem Staat sind. Daher wird der Staat in den USA bis zu einem weit höheren Grad als in Europa als der Ausdruck guter Ideale verstanden. Was der Grund dafür ist, warum in den USA Nation, Ideal und Staat noch immer eine Einheit bilden - den „letzten Nationalstaat des Westens“, wie er oft genannt wird. Ganz anders als in Europa, wo intellektuelle Aufgeklärtheit geradezu als Widerstand gegen die Staatsmacht aufgefaßt wird und sich zum Beispiel die Politikwissenschaften spätestens seit 1968 als systemisches Antidoton und Korrektiv der Politik verstehen, nicht als deren wissenschaftliche Unterstützung und Hilfswissenschaft wie in den USA.

Was bedeutet das, wenn wir es auf die eingangs angeführte „Klientel“-Problematik des US-Systems rückbeziehen?

Ein US-Präsident kann einen Großteil der Washingtoner Staatsbediensteten nach eigenem Gutdünken berufen. Obama hat natürlich „seiner“ Klientel, die ihm an die Macht verholfen hat, im Januar 2009 die besten Positionen verschafft. Das waren in seinem Fall demokratische Parteikreise, Intellektuelle, Zivilgesellschafter und auch „Alternativ“-Juristen, vor allem aber gebildete Kreise der oberen Mittelschicht, der Künstlerschaft und der Universitäten. Obama hat sie als Belohnung für seinen Wahlerfolg dazu befähigt, eine Rolle im Herzen des politischen Systems zu spielen: Meinung zu machen, öffentlichen Druck zu erzeugen, und damit die großen Richtungnahmen mitzubestimmen.

Als aber diese Kreise gegenüber seiner Durchsetzungskraft relativ früh skeptisch wurden, weil sie viel zu vieles in viel zu kurzer Zeit erwarteten, brach ein wichtiger Aspekt von Obamas politischem Rückhalt weg: der innere Ideenaspekt und seine natürlichen progressiven Träger als Motor der Veränderung.

Der Einfluss von Ideengruppen auf das heutige politische System der USA

Bedeutet dies also, daß Obama letztlich abhängiger von - im weitesten Sinne - Klientel-Interessen ist als seine Vorgänger?

Dieser Schluß liegt in Betrachtung der heutigen Situation nahe. Doch noch weit wichtiger als Interessensgruppen sind seit der amerikanischen Verfassung 1776 Ideengruppen. Das hat damit zu tun, dass die US-Verfassung aus klar freimaurerisch-rosenkreuzerischen Ideen heraus entstand und sich bis heute in den zivilreligiösen Grundlagen der Gesellschaft mehr oder weniger offen dazu bekennt. Ideale, Substanzideen und Essentialismen sind in den USA viel präsenter und offener mit der Politik und den Institutionen verbunden als in Europa. Jedesmal, wenn diese Ideenformationen sich mit Interessensgruppen verbinden, dann wird es sozusagen Ernst. Das war zum Beispiel unter George W. Bush der Fall, als irreguläre rosenkreuzernahe Kreise - in Gestalt der Gesellschaft „Skull and Bones“, das heisst: „Schädel und Gebeine“ - sich mit fundamentalistischen christlichen Interessen und Ölinteressen verbanden.

Das tat den USA nicht gut. Denn daraus entstand ein neuer gesellschaftlicher „Unitarismus“, in dem Geltungsgrenzen zwischen Diskursen und Systemlogiken verwischt wurden und wirtschaftliche, religiöse und politische Interessen sich zu einem undifferenzierten Filz verbanden, wodurch die innere und äußere Freiheit abnahm. Das politische System wurde entdifferenziert, und eine allgemeine Regression war die Folge. Das zeigten die Ergebnisse der Bush-Ära sowohl nach innen wie nach aussen.

Obama, der davon profitierte, hat die Lektion der Bush-Ära verstanden: dass „Unitarismus“ gesellschaftlich regressiv und Ausdifferenzierung progressiv wirkt. Auch weil er nach eigener Aussage insbesondere die Aussenpolitik des Vaters seines Vorgängers, George H.W. Bush, intensiv studiert hat. Bush Vater war ebenfalls Mitglied von „Skull and Bones“, der Ölindustrie und des „WASP“-Establishments - das bedeutet: der herrschenden Elite der USA: weiss, angelsächsisch, protestantischer Religion.

Obama ist einer der wenigen US-Präsidenten, die mit der darin zum Ausdruck kommenden Macht der Verbindung weltanschaulicher, ökonomischer und politischer Interessensgruppen zu brechen versuchen. Er versucht, progressive Ideengruppen an ihre Stelle zu setzen. Das ist in gewisser Weise revolutionär. Es ist aber auch, wie sich am Beginn seines zweiten Amtsjahres angesichts wachsenden Widerstandes nicht nur „von aussen“, sondern auch „von innen“ immer deutlicher zeigt, ein überaus schwieriges Unterfangen, das auf viel offenen, noch mehr aber auf verborgenen Widerstand hinter den Kulissen stösst.

Warum?

Obamas Weltanschauung und ihr Einfluss auf seine Politiken

Die Interessensgruppen der USA haben sich in der neueren Geschichte so dicht und intensiv mit geistig-weltanschaulichen Gruppen verbunden, dass hier ein Dickicht besteht. Obama stand und steht programmatisch für einen „tiefen" Paradigmenwechsel, das heisst nicht nur für einen politischen und ökonomischen, sondern auch für einen geistigen und moralischen Wandel – ein Risiko, das man in Europa in seiner historischen Tragweite und Bedeutung nur unzureichend verstanden hat. Inwiefern?

In den vergangenen Jahren hatten vor allem ökonomische und christlich-fundamentalistische Gruppen, aber auch okkulte Ideen im Umkreis von irregulären freimaurernahen Ideengruppen wie etwa die Gruppe „Skull and Bones" Zugang zum US-Präsidenten. Dazu expansionistisch-christliche Ideen wie etwa die eines Oswald Chambers (1874-1917), eines protestantischen Missionars und Kriegspfarrers, der die britischen Truppen im ersten Weltkrieg bei der Eroberung Palästinas und Jerusalems geistig betreute. Seine Schriften meditierte George W. Bush nach eigener Aussage jeden Tag um 6 Uhr morgens.

Obama hat in dieser Hinsicht keine dezidierte Ausrichtung, sondern ist viel pragmatischer als Bush. Er ist ein „rational Spiritueller", der sich neben den im Umkreis der „Trinity United Church of Christ in Chicago" veröffentlichten Schriften stark an dem Theologen Reinhold Niebuhr (1892-1971) orientiert. Dieser trat für eine Modernisierung von Religion und ihres Verhältnisses zu Politik und Gesellschaft ein, war ein Sozialist und einer der Hauptvertreter des Gedankens vom „gerechten Krieg". Letzerer spiegelte sich zum Beispiel in Obamas Friedensnobelpreisrede vom 10. Dezember 2009 wieder. Niebuhrs bekanntester Text ist das sogenannte „Gelassenheitsgebet", das vermutlich während dem zweiten Weltkrieg entstand, und das Obama nach eigener Aussage seit vielen Jahren täglich meditiert. Es lautet:

„Gott, gib mir die *Gelassenheit*, Dinge hinzunehmen, die ich nicht ändern kann, den *Mut*, Dinge zu ändern, die ich ändern kann, und die *Weisheit*, das eine vom anderen zu unterscheiden."[5]

Der Einfluss Niebuhrs spiegelt sich aber auch in der Art wieder, wie Obama Menschen beurteilt. Er beurteilt sie nicht nach ihrem „rechten Glauben" wie Bush, sondern nach ihrem individuellen Charisma und nach ihren geistigen Errungenschaften Fall für Fall. Das wird aus seiner engeren Umgebung glaubwürdig berichtet. Aber das ist zugleich sehr gefährlich für ihn. Denn wer sich auf den einzelnen Menschen verlässt und dafür die „organisierte" Anhängerschaft im institutionellen Sinn vernachlässigt, hat die Gruppen-Klientels und vor allem ihre professionellen Vollzeit-Vertreter in Washington generell gegen sich. Man kann sich in Europa kaum vorstellen, welchen Druck diese Vertreter entfalten können, und welche Macht sie hinter den Kulissen tatsächlich besitzen. Sie sind in der Lage, einem Präsidenten das Leben und die Entscheidungen so schwer wie nur möglich zu machen – oder diese Entscheidungen durch Obstruktionspolitik gar zu verunmöglichen.

---

[5] U.a. in: http://de.wikipedia.org/wiki/Gelassenheitsgebet.

Ist Obama in Summe also tatsächlich ein „rational spiritueller“ Mensch, wie er bei öffentlichen Auftritten, in Interviews und in seinen Schriften immer wieder aktiv unterstreicht? Und wenn ja, wie macht sich das bemerkbar?

Insgesamt kann man sagen: Mit europäischen Freiheits- und Individualitätsphilosophien, darunter vor allem der „Philosophie der Freiheit“ (1894) des österreichischen Sozialreformers und Philosophen Rudolf Steiner (1861-1925) als Lesegrundlage kann man vieles von der heutigen Änderung in den USA im Übergang von der *Religiosität* eines George W. Bush zur *Spiritualität* Barack Obamas besser verstehen als mit den klassischen US-Theorien von Pragmatismus und Idealismus - aber auch als mit den meisten herkömmlichen politischen Theorien, und zwar eben deshalb, weil diese Änderung im Fall Obamas so stark idealistisch, „kontextuell“ und liberal geprägt ist.

Wenn Bush eine Art konfessioneller Theosoph von „Skull and Bones“ Gnaden bei gleichzeitiger naiv realistischer Glaubensmythologie war, so ist Obama in seiner Weltanschauung viel näher an einer europäisch-protestantisch gefärbten „Philosophie der Freiheit“. In seinen dazu zahlreich, wenn auch verstreut und unsystematisch vorliegenden Statements, darunter vor allem ein in Buchform erschienes Langinterview zu seiner Spiritualität, das er mit der angesehenen Journalistin Cathleen Falsani bereits vor seiner Präsidentschaftskandidatur im Jahr 2004 führte,[6] betont er immer wieder, dass er versuche, sich seinen „geistigen“ Erfahrungen bereits während ihres Geschehens kritisch gegenüberzustellen – eine frappierende Nähe zur „rational-spirituellen“ Forderung Steiners, „sich der Idee erlebend gegenüberzustellen, sonst gerät man unter ihre Knechtschaft“ (die im übrigen ähnlich auch die ebenfalls „neo-integrativen Idealisten“ Jean Gebser und Teilhard de Chardin stellten)!

Obama zeigt insgesamt immer wieder Züge, die ihn in die Nähe einer modernen, rationalen Freiheitsspiritualität stellen, wie sie zum Beispiel Steiner, Gebser und de Chardin, aber auch andere „in der Vereinigung von Hegel, Goethe und Kant phänomenologisch gereifte Idealisten“ wie etwa Carl Fortlage im 19. und 20. Jahrhundert für Europa grundlegten, und wie sie freimaurerisch-rosenkreuzerische Ströme bereits lange vorher explizit an die Grundlage der US-Verfassung stellten.

Die dreifache Entwicklung in den zeitgenössischen USA und die Anforderung an die zentraleuropäischen Politikwissenschaften

Es macht meines Erachtens wenig Sinn, derartig konstitutive Zusammenhänge zwischen Politik, „realistischem“ Idealismus und „Geistrealismus“ länger zu ignorieren, kleinzureden oder als „private Überzeugungen“ abzutun, wie es Teile der akademischen Politik- und Sozialwissenschaften insbesondere des deutschsprachigen Kontinentaleuropa im Hinblick auf

---

[6] C. Falsani: The God Factor. Interview with Senator Barack Obama about his Spirituality. March 27, 2004. In: C. Falsani’s Blog: The Dude Abides, http://falsani.blogspot.com/2008/04/barack-obama-2004-god-factor-interview.html. Vgl. die leicht abweichende Fassung in: http://blog.beliefnet.com/stevenwaldman/2008/11/obamas-interview-with-cathleen.html. Das Gespräch wurde ursprünglich in der Chicago Sun Times abgedruckt und floss später in das Buch von C. Falsani ein: The God Factor: Inside the Spiritual Lives of Public People. FSG 2006.

Obamas Weltanschauung noch immer tun, weil sie - aus guten Gründen - die affirmative Auseinandersetzung mit „substantialistischen“ Ideenentwürfen aufgrund der Erfahrungen mit den Totalitarismen des 20. Jahrhunderts tabuisiert haben. Sie taten dies für Zentraleuropa zu Recht, aber sie taten es undifferenziert gegenüber *jeglichem* Substanzanspruch und Geistrealismus. Diese Paradigmenhaltung war und bleibt zwar verständlich, und sie erbrachte bedeutende, unverzichtbare Errungenschaften wie nachhaltige Liberalisierung und Emanzipation, hinter die nie mehr zurückgefallen werden darf. Zugleich behindert sie heute in ihrer bestehenden paradigmatischen Einseitigkeit aber das zentraleuropäische Verständnis der Vorgänge im „Inneren“ des Politischen Amerikas erheblich. In den USA ist heute *erstens* eine „Resubstantialisierung“, *zweitens* eine Mobilmachung kontextueller und vorpolitischer Politikdimensionen gegen das institutionalisierte Politische, *drittens* eine allgemeine weltanschauliche Mobilmachung zu machtpolitischen Zwecken im Gange. Diese dreifache Entwicklung kann ohne affirmatives Verständnisbemühen gegenüber den ausnahmslos auf allen Seiten im Spiel befindlichen „essentialistischen“ Paradigmenanteilen nicht hinreichend erfasst und kritisch begleitet werden.

Es gilt hier daher meines Erachtens, nach dem Ende der Nachkriegszeit 1989/91 auch in den Paradigmen der zentraleuropäischen Politikwissenschaften einen Schritt weiter zu machen in eine ausgewogenere und differenziertere Anschauung. Diese müsste die bisherige universal ideologie- und anspruchskritische Paradigmen-Haltung mit ihrem Kernziel der Verteidigung von Geltungsgrenzen zwar rückhaltlos und aktiv fortsetzen, aber darüber hinaus auch einen gemässigten Idealismus mit dem gängigen Nominalismus zusammenzuschauen versuchen. Und zwar nicht aus intellektuellem Wagemut, sondern weil diese Verbindung der (ideen-)geschichtlichen Entstehung und Entwicklung der USA entspricht, ja an ihrer Grundlage steht, und weil ohne sie heute weder Obama noch seine Gegner und ihre Strategien ausreichend zu begreifen sind - wie sowohl er selbst wie sie immer wieder betonen. Dies scheint mir aber auch entscheidend, damit Europa nicht hinter Amerikas langsame, aber historisch stetige „integrative“ Paradigmen-Entwicklung zurückfällt.

Obamas politischer Manichäismus

Diese Paradigmen-Entwicklung zu verstehen, heisst natürlich auch, ihre eingebauten Widersprüche und Ambivalenzen zu erkennen. So besteht zum Beispiel nicht nur eine innere Spannung zwischen Obamas doppeltem Bemühen sowohl um eine „realistische“ wie um eine „rationale Spiritualität“ im Sinne Niebuhrs und Steiners, sondern auch ein offenbarer Gegensatz zwischen dieser Bemühung und seiner manchmal naiv „realistisch“ anmutenden Auffassung des Bösen, wie sie sich zum Beispiel in seiner Nobelpreisrede vom 10. Dezember 2009 ausdrückte.

Viele Beobachter stellten sich angesichts dieser in Teilen fast reaktionär anmutenden Rede die Frage: „Packt“ Obama seine diesbezüglichen Ansichten nur rhetorisch „besser ein“ als George W. Bush, denkt aber letztlich zumindest in gewissen Schichten seiner Vorprägung und Anschauungsbildung in ähnlichen Kategorien?

In dieser Rede war in der Tat mehrfach von „dem Bösen“ die Rede, das im Zeichen des wahren Menschentums und der Freiheit bekämpft werden müsse. Dieses „Böse“ erscheint bei Obama, genauso wie bei seinem Vorgänger George W. Bush, als eine gewissermassen eigenständige Kraft in der Welt. Nicht weniger als 36 Mal verwendete Obama das Wort „Krieg“, immer in Verteidigung des „gerechten Krieges“. Das war gewiss eine der aussergewöhnlichsten und paradoxalsten Preisreden eines Friedensnobelpreisträgers, die je gehalten wurden, kulminierend in der Aussage: „Krieg wird es immer geben.“[7]

Wenn das ein Friedensnobelpreisträger ausgerechnet bei der Ehrungszeremonie sagt, die der Herbeiführung des Endes der Kriege dienen soll, dann gibt es eigentlich nur drei Möglichkeiten:

1. er ist extrem realistisch;
2. er ist ein Manichäer (als der sich, mit dem Zusatz „säkularer“ Manichäer, im übrigen mittlerweile auch der heutige Jürgen Habermas bezeichnet);[8]
3. er will mittels eines aussenpolitischen Auftritts bei einer „fremdländischen“ Veranstaltung, die im Grunde dem Geist der USA nicht entspricht, ein innenpolitisches Signal der Stärke, des Realismus und des überzeugten Festhaltens an den US-Idealen an seine eigene Bevölkerung senden.

Ich glaube an eine Mischung aller drei Motive, mit starkem Akzent auf dem letzteren, dem innenpolitischen Anliegen. Warum?

Man darf *einerseits* nicht vergessen, dass die Verleihung des Friedensnobelpreises nach bereits wenigen Monaten im Amt Obama innenpolitisch mehr geschadet hat als vieles andere: Er erhielt - eben auf der vorpolitischen, kontextuellen Ebene der Weltanschauungsdiskussion - den Ruf des „abgehobenen Weltstars“, der von der Welt grundlos vergöttert werde, ohne etwas geleistet zu haben, und der daher irgendwie eher für die Welt als für die USA arbeite. Und das mögen die Amerikaner ganz und gar nicht. Daher war ein starkes innenpolitisches Signal der Zugehörigkeit nötig.

Obama kann *andererseits* aber trotz seiner „rationalen Spiritualität“ insgesamt auch als eine Art politischer Manichäer gelten, wenigstens von seinem pragmatischen Wirklichkeitszugang her - wie im übrigen alle US-Präsidenten seit dem 1. Weltkrieg. „Das Böse“ ist für Obama eine Realität, wie auch für seinen Vorgänger George W. Bush, und seine Nobelpreisrede hätte nach übereinstimmender Meinung der meisten Beobachter deshalb auch von Bush sein können.

Im Vergleich wird sichtbar: Beide waren und sind Geistrealisten, und beide hatten und haben eine starke manichäische Färbung, sobald sie ihre - an sich sehr unterschiedlichen - Auffassungen und Praktiken von „Spiritualität“ in die politische Praxis tragen. Das hat weniger mit den Personen, sondern vielmehr mit dem Amt zu tun: mit der Geschichte der USA als Heilsträger der Freiheit, auch mit den rosenkreuzerisch-freimaurerischen Grundlagen und mit der

---

[7] B. Obama: Remarks at the Nobel Peace Price Ceremony in Oslo, December 10, 2009. Released by the White House. In: The New York Times, December 10, 2009.

[8] Ein „Manichäer“ ist jemand, der glaubt, dass die Welt zwischen zwei Göttern geteilt ist, die um sie kämpfen, und zwar in und ausserhalb des Menschen: das Gute und das Böse. Es gibt also streng genommen nicht einen, sondern zwei Götter, die um den einen Ort kämpfen, an dem sich das Schicksal des Kosmos und seiner Evolution versammelt, konzentriert und entscheidet: um die Seele des Menschen. Ein „politischer Manichäer“ ist jemand, der seine Handlungen im Zeichen dieses Kampfes verortet und seine Entscheidungen unter dessen Bedingungen trifft.

Mischung von Protestantismus mit calvinistischer Arbeitsethik in den idealistischen Grundlagen des Landes. Das Amt färbt die Spiritualität der Person ein. Es ist in gewisser Weise größer als die Person, gleichzeitig aber auch wiederum von ihrer Freiheit abhängig.

Es ist dies im Grunde derselbe Gesamtzusammenhang zwischen „subjektiv" und „objektiv" wie in der oben erwähnten „Philosophie der Freiheit" Rudolf Steiners: Der Amtsinhaber muss sich dem Amt erlebend gegenüberstellen, sonst gerät er unter seine Knechtschaft. Das haben auch „kantianische" europäische Politiker wie zum Beispiel Helmut Schmidt erfahren müssen; nur war bei ihnen der Bezug zwischen Weltanschauung, Geisteshaltung und politischer Funktion weit weniger explizit und direkt als in den heutigen USA.

In den USA muss bis heute jeder Präsidentschaftskandidat öffentlich angeben, welchen Weltanschauungsgemeinschaften er angehört. Bush gab „Skull and Bones" und eine protestantische Kirchengemeinschaft an; Obama gab neben europäischen und US-Philosophen und –Theologen die Chicagoer Kirche seines ehemaligen Mentors Jeremiah Wright an. Letztere ist stark manichäisch und politisch - im Sinn des „Civil Rights Movements", aber auch einiger ethnopolitischer „rechts-emanzipatorischer" Kreise - gefärbt.

Es stellen sich aus der Beobachtung dieses offenbar zentralen Einflusses zwischen Idee und Wirklichkeit bei Obama natürlich viele Fragen. Wenn man sie stellt, wird man allerdings - eben dadurch - unversehens wenigstens bis zu einem gewissen Grad selbst zum „politischen Manichäer": Produziert Politik von sich aus Manichäismus als Weltanschauung? Heisst in die politische Wirklichkeit des 21. Jahrhunderts einzutreten in gewisser Weise bereits, zum Manichäer zu werden? Immerhin muss man Entscheidungen treffen in einem zunehmend komplexitätsgesättigten Umfeld, das durch eine zunehmenden Polarisierung der Lager und der Ideen gekennzeichnet ist.

Ich würde diese Fragen nicht beantworten wollen, sondern hier als Anregung offenlassen.

Die US-Politikwissenschaft stellt diese und ähnliche Fragen ständig und in großen, viel rezipierten Abhandlungen, und sie stehen heute im Zentrum auch der öffentlichen politischen Debatte der USA. Europa, insbesondere Zentraleuropa, hat sie aus dem Vernunftdiskurs verdrängt.

Ich denke, dass es sie zumindest in ideengeschichtlicher Sichtweise, vergleichender Perspektive und heuristischer Absicht wiederzugewinnen gilt, um die Motivationen, Denkweisen und Ambivalenzen führender Staatsvertreter der USA der Gegenwart besser zu verstehen.

Die Perspektiven: Die heutige „große Neuausrichtung" der USA unter Barack Obama – und ihre Folgen für Europa

Wo liegen die Perspektiven der beschriebenen Konstellation im Inneren der heutigen USA? Und: Was will Obama wirklich? Wofür kämpft er nach eigener Aussage so energisch, dass er dafür sogar eine mögliche Nichtwiederwahl in Kauf nimmt, die seiner „kulturellen" Ablehnung durch Mehrheitsteile der US-Bevölkerung geschuldet sein könnte?

Obama will die USA auf neue Grundlagen stellen, damit sie in der neuen Weltkonstellation des 21. Jahrhunderts reüssieren. Dazu will er ihren „ursprünglichen" idealistischen Geist wiedererwecken, um sie zu befähigen, die Dinge mit neuer Inspiration zu verändern und dadurch die USA in „vertieft neue" Formen und Orientierungen für das 21. Jahrhundert zu giessen. Ziel ist die Erreichung einer „neuen Qualitätsstufe" der US-Zivilisation für die kommende Moderne.[9]

Das gilt für die Wirtschafts- und Sozialstruktur, es gilt für das Gesundheitswesen, für das Verhältnis der öffentlichen Vernunft zu Technologie und Forschung, aber auch für die längst überfällige Reform des politischen Systems, zum Beispiel des Wahlsystems. Unter anderem findet von 2011 an eine Neueinteilung der Wahlbezirke (congressional redistricting) statt, um bei den Kongresswahlen 2012 größere Gerechtigkeit zwischen Stimmen und Repräsentation herzustellen. Darauf bereiten sich Republikaner und Demokraten bereits heute intensiv vor.

Am wichtigsten aber ist die allgemeine, grundlegende Einsicht in den großen Wandel, der sich heute global vollzieht – und in den Obama die programmatisch versprochene „glaubwürdige Veränderung" (*change we can believe in*) ausdrücklich einbetten will. Diesen globalen Wandel nehmen alle Kreise der USA - Politik, Wirtschaft, Kultur und Wissenschaft, aber auch der religiöse Bereich - durchgängig viel ernster als die Europäer. Die Diskussion darüber beherrscht hier jeden Tag das kollektive Nachdenken, sie ist allpräsent in der öffentlichen Vernunft, während sie in Europa bislag nur eine untergeordnete Rolle spielt.

Der Analytiker Zareed Fakaria fasste die alles entscheidende, zentrale Einsicht, die sich im Rahmen dieser Diskussion heute in den USA durchsetzt, kürzlich prägnant so zusammen: „Die Entwicklungsgeschichte von Großmächten zeigt, dass sie, um ihre Position zu wahren, die Quellen ihrer Macht, nämlich ökonomisches Wachstum und technologische Innovation, erhalten und stärken müssen. Sie zeigt aber auch, dass sie sich auf die Zentren globaler Macht, nicht auf deren Randgebiete konzentrieren müssen. Es ist in dieser Hinsicht wichtig, sich daran zu erinnern, dass in den folgenden hundert Jahren die dominante Position Amerikas in Asien – ihre Rolle als ausgleichende Macht in der Pazifikregion - ausschlaggebend sein wird für den Erhalt der Rolle der USA als Weltmacht." [10]

Was bedeutet das?

Es bedeutet, dass Europas Bedeutung schnell und nachhaltig sinkt. In den USA wendet man sich heute massiv von Europa ab – weil man die Zukunft der eigenen Stellung in der Welt in der Rolle erkennt, welche die USA im Pazifik spielen werden. Obama ist der erste Präsident, der mit diesen langfristigen strategischen Einsichten Ernst macht: Er bricht mit Bushs „Anhänglichkeit an Europa". Paradoxerweise wird Obama währenddessen gerade in Europa am meisten verehrt und mystifiziert. Im Januar 2010 fand in Frankfurt am Main sogar die Uraufführung eines ihm gewidmeten Musicals statt – nicht zufällig in Deutschland.

Baer zurück zu den Dingen die zählen: Worin genau besteht die „große“ Neuausrichtung Obamas?

Obama bereitet die USA auf die „globale Systemverschiebung“ vor, die in vier großen Dimensionen stattfinden wird:

1. Das Ende der „neuen Weltordnung“, das heisst der Ära seit den 1990er Jahren, in der die USA die Welt als einzige Supermacht dominierten, und die Entstehung einer multipolaren Welt, in der die pazifische Region immer mehr an Bedeutung gewinnt, während Europas Bedeutung abnimmt;
2. die Ablösung der „Postmoderne“ als säkulares, „dekonstruktives“ Kulturmodell des Westens durch andere, komplexere Kulturmodelle, die Nominalismus und Geistrealismus verbinden;
3. das Ende des „Neoliberalismus“ und die Notwendigkeit von nachhaltigeren und gerechteren Wirtschafts- und Technologieformen;
4. die „Renaissance der Religionen“ und damit die Herausforderung der Verbindung von Rationalität und Spiritualität.

Es entsteht insgesamt eine Welt von „miteinander im Wettstreit liegenden Modernitäten“ („competing modernities“). In dieser werden Gesellschaften wie China technologisch und wirtschaftlich ähnlich entwickelt sein wie der „Westen“, aber ganz andere Auffassungen davon haben, was ein „gutes Leben“ und eine „gute Gesellschaft“ ist – Auffassungen, die zum Beispiel im Fall Chinas nicht an Demokratie, Rechtsstaat und Menschenrechte gebunden sind, sondern eher an Harmonie, Stabilität und Einheit.[11] In diesem Feld werden sich die westlichen Ideen von Moderne bewegen müssen.

Darauf bereitet Obama die USA vor. Es ist wie ein riesiges Schiff, das langsam den Kurs ändert – langsam, weil das Schiff eben so groß ist, aber unweigerlich. Der Kurs wurde bereits geändert. In Richtung Pazifik, in Richtung Asien.

Schlussfolgerung und Ausblick

Welche Bilanz der bisherigen Amtszeit Obamas lässt sich zusammenfassend ziehen? Hat sich die Welt seit Obamas Amtsantritt durch sein Wirken verändert? Und, wenn ja, in welche Richtung?

Soweit sichtbar ist, kann man zur Hälfte von Obamas zweitem Amtsjahr sagen: Die Welt hat sich in Richtung einer liberaleren und weniger imperial geprägten Weltordnung verändert, aber auch in Richtung Pazifik. Vergessen wir nicht, dass Obama selbst in Hawaii geboren wurde, zum Teil in Indonesien aufwuchs und Verwandschaft in mehrere „Rassen“ hinein hat: „schwarz“, „weiss“, asiatisch. Obama ist als Person bereits eine „Mischung“ der Zukunft, auf die die USA nun unter seiner Führung weltpolitisch hinsteuern.

[11] M. Jacques: When China Rules the World. The End of the Western World and the Birth of a New Global Order, Penguin Press 2009.

Und wo liegt Obamas eigene Perspektive - für die zweite Hälfte von 2010, und darüber hinaus?

Die in Obamas komentenhaftem Aufstieg mit angelegte Ambivalenz kommt in der ersten Hälfte seines zweiten Amtsjahres politisch zum Tragen. Sie hat in die heutige „grosse Obama-Spaltung“ (the great Obama divide) der USA nicht nur zwischen Konservativen und Liberalen, Republikanern und Demokraten, sondern vor allem zwischen vorpolitisch-kontextuellen und normativ-institutionalisierten Politikdimensionen geführt. Sie hat - wenn auch unwillentlich - ein Klima erzeugt, in dem eine allgemeine Mobilmachung weltanschaulicher Faktoren gegen die institutionalisierte politische Macht vorherrscht.

Obama hat unter dem wachsenden Druck dieser Verhältnisse nun bis zu den „midterm elections“ im November 2010 Zeit, konkrete, zählbare, sichtbare Erfolge einzufahren. Dabei sind innenpolitische Erfolge deutlich wichtiger als aussenpolitische. Obama wird deshalb die Aussenpolitik weiterhin dazu benutzen, um innenpolitisch Boden gut zu machen – wie er es bereits in den zwei Schlüsselreden seines ersten Amtsjahres zu Afghanistan am 1. Dezember 2009 und anlässlich der Entgegennahme des Friedensnobelpreises am 10. Dezember 2009 tat. Und er muss nun nach dem äusserst knappen Erfolg bei der Gesundheitsreform US-intern weitere Gesetze durchbringen, Änderungen konkretisieren. Nutzt Obama dieses Zeitfenster nicht, und bleibt es wie bisher bei Ankündigungen und Worten, dann steht, wie gut die Rhetorik Obamas auch immer sein mag, seine Zukunft in Frage. Denn dann werden auch seine Worte rasch an Wirkung verlieren – sogar in den traditionell „wortehörigen“ USA.

Was bedeutet das für uns Europäer?

Es gilt nun meiner Meinung nach gerade in dieser schwierigen Lage, Obamas idealistischen Impetus entschieden zu unterstützen und zu stärken. Ich war stets für vernunftgemäße Entzauberung und Kritik, als Obama irrational in den Himmel gejubelt wurde; nun bin ich für vernünftige Solidarität und gerechte Anerkennung. Obama ist der einzige, den ich derzeit in den USA, vielleicht sogar in der „westlichen“ Welt insgesamt sehe, der das Ideal mit der Wirklichkeit ernsthaft, als Persönlichkeit und Mensch, verbinden will, und der auch den Instinkt und das Talent dazu hat. Obama ist eine Persönlichkeit, die mit aller individuellen Kraft eine balanciertere und gerechtere Welt will. Er verdient deshalb Vertrauen nicht nur kurzfristig, sondern auch durch Schwierigkeiten und Abgründe hindurch – und gerade dann am meisten. Im klärenden, blendenden Licht des Problems beweist es sich nämlich, was wir wirklich glauben, woran wir uns halten, was wir wirklich wollen – nicht in Zeiten des Erfolges, wo alle Katzen grau sind vor blinder Euphorie.

Wir Europäer sollten Obama meiner Meinung nach deshalb nun vergleichsweise grosszügig unterstützen - zumindest so lange, bis die Verhältnisse für ihn wieder so gut sind, dass wir ihn wieder kritisieren müssen. Dies nicht zuletzt auch, um Europa wieder stärker in sein Sichtfeld zu bringen. Ich halte Obamas Abwendung von Europa für eine besorgniserregende Entwicklung, die letztlich nur wir Europäer selbst korrigieren können.

The Tao of Liberation:
Exploring the Ecology of Transformation

Mark Hathaway & Leonardo Boff, 2009. Orbis Books: Maryknoll, New York

Review by Steven E. Wallis[1]

This book is structured in three parts. The first part (about 100 pages) recounts the growing threat of global ecological collapse. The second part (about 200 pages) investigates cosmology; including discussions around Gaia, the pregnant void, and holographic cosmos. The final part (about 100 pages) is focused on spirituality, with particular effort applied to finding a common thread among the world's major religions. Those threads support the authors' cosmology and conclusion that we should all follow a specific path towards self-liberation. With the liberation of self, the authors quite reasonably claim, we will become more effective in practice and so better able to save the human race and our planet.

For this review, I began by reading with an appreciative eye. And, from that view, some are likely to find this an interesting book. The authors present a wealth of information on many topics including physics, religion, biology, systems theory, and creativity. They also engage in an extensive conversation around globalization, domination, deep ecology, and spirituality.

Next, in reading this book with a critical eye, the book appears to be well written. Indeed, the authors have crafted a work that readers will find quite accessible. They have purposefully structured the book in something of a spiral by revisiting key topics from different perspectives as they proceed through the cycle. Examples are found in modern science, ethics, economics, politics, transnational corporations, and more. Their main effort is to present a link between the critical state of the global ecology and the spiritual practices that we might draw upon to empower ourselves.

In a nutshell, they describe the domination and destruction of the ecosystem by those who are blinded by a systemic pathology. Goals of wealth and power, limitless growth, and desire for a global monoculture have blinded many to the precarious state of our ecosystem. They also reasonably note how most humans are (in one way or another) complicit in that pathology (and are likewise blinded). The authors suggest that we fear to give up our way of life – even if is

He has been published in a variety of academic books and journals and is the founding director of the Foundation for the Advancement of Social Theory. There, he supports scholars who are working to identify rigorous paths for the validation of social theory. Through this metatheoretical approach, Dr. Wallis expects to accelerate the advancement of the social sciences for the optimization of human and global systems. Email: swallis@ProjectFAST.org

SOME RIGHTS RESERVED

necessary to save the planet. In order to see clearly, make wise choices, and enact critical changes, we must first liberate ourselves from our fears.

To escape those fears, we must move away from oppression (of ourselves and others) and toward a sense of liberation. To achieve this shift, we should first understand that all people are sensitive and compassionate. Second, they suggest that we should expand our sense of self to include the whole of our planet. This, they say, will lead to a better sense of community, artistry, and appreciation for the beauty of nature. From a cosmological perspective, that shift would be supported by a new view of the universe. The authors discuss how the universe is fundamentally open to many possibilities. For example, most of our universe (including seemingly solid objects) is actually empty space – thus allowing for emergence, surprise, and innovation.

Adopting that view, they suggest, will allow us to liberate ourselves and so enact the future needed to save our planet. While none of these ideas are particularly novel, that message may be of interest to appreciative readers. As with many books of this type, however, their analyses are neither rigorous nor complete. Critical readers will be very aware that the authors present contradictory perspectives, engage in questionable leaps of logic, and present curious styles of reasoning.

One such contradiction begins with the Tao and its suggestion that we are all one and closely interconnected. Instead of following the Tao, the authors press forward with ideas that separate rather than integrate. They separate modern ideas from the postmodern, separate the global elite from the masses, separate the responsible from the innocent, and so on. For another example, the authors decry the “wealth gap,” while they also claim “money is an illusion.” Another related contradiction is seen between the authors’ perspective that the universe is continually evolving (on one hand) and the perception that the powerful individuals and corporations are standing in the way of that evolution (on the other hand). This view seems to suggest that those corporations are somehow outside that cycle of evolution. And, while transnational corporations are indeed powerful, it is hard for me to accept that they are so powerful that they can somehow escape the natural laws of the universe.

While these contradictions do not appear to be purposeful, we need not see them as problematic. Indeed, by reading with an integrative eye, those contradictions may represent the best reason to read The Tao of Liberation. Such contradictions may be more usefully viewed as chunks of raw material from which thinkers might build more profound insights. In short, I would suggest that the “space” between those contradictory views is open for the emerging ideas of deeply reflexive readers.

For example, instead of adopting the “us versus them” view of the world, I would suggest that readers who are bold enough to engage this book with an integrative eye might consider how we are all part of the same system. And, by developing a better understanding of that system, investigate how we might optimize our individual, organizational, and global conditions.

In addition to the excessive differentiation, this book also challenged my sensibilities in its discussion of cosmology. First, the authors recount multiple claims for the existence of an “alternative” universe. That other universe is variously represented as a primal universe, holographic universe, implicate order, and morphic field. The existence of this primal universe is certainly intriguing. It is reported to be a place of great interconnectedness and a conduit for insight, creativity, communication and memory. The alternative universe transcends (and renders irrelevant) the dimensions of time and space that we find in our own universe. Through meditation, they suggest, one may connect with that universe to become more creative and gain new insights.

After many pages, I found myself wondering about the need for a cosmological justification for meditative practices. Practically and functionally, if one meditates and successfully achieves insight, does it really matter “where” that insight comes from? In short, it seems to this reviewer that the authors created an unnecessarily complex picture of a destination in order to justify the relatively simple path of meditation.

Overall, reading this book is like strolling through a bustling farmer’s market. In looking at that many options, one is inspired to consider how they may be combined for a tasty dinner. There does not seem to be much that is new in this market, but there is a multitude of possibilities for combining those ingredients. This suggests many levels of possible engagement for this book. On one level, the appreciative reader may adopt any of the many concepts presented here. In contrast, the critical reader will likely be frustrated by the curious cosmology and unnecessary complexity. The more contemplative reader, with a more integrative eye, may engage this book on a deeper level. Those scholars may go beyond the loose weave of ideas presented in this book to create a more effective integration of ideas. And, in that process, develop much needed, and much more innovative ideas.

Response to Wallis

Mark Hathaway[1]

I greatly appreciate the reflections Steven Wallis has presented in his review of *The Tao of Liberation: Exploring the Ecology of Transformation*. In particular, I enjoyed the succinct summary he has provided of many of the key themes of the book along with his astute observations about its contents.

The book is meant to be an integrative text drawing on many different disciplines. Leonardo Boff and I describe it as a "search for wisdom in a time of crisis." I think one of its strengths is drawing together insights from a wide diversity of perspectives. This may well make it resemble a stroll "through a bustling farmer's market." Yet, perhaps a better image would be that of walking the labyrinth – a spiralling journey that is certainly non-linear in its logic, but which serves to help reveal more subtle dynamics at play. To some, the perspectives presented may at first seem to be contradictory, but over time the coincidences of these insights becomes more apparent.

In using the image of the Tao, we speak of a reality that cannot be fully described, but must rather be tasted. The book is meant to engage the reader at a more intuitive level, providing a sense of feel for a "way" that cannot ever be fully described in words.

I would suggest that some of the apparent contradictions that Dr. Wallis perceives may not, in fact, be contradictions at all. Certainly, the book speaks of a cosmology of deep interconnection. While, overall, cosmic evolution seems to be characterized by a movement toward ever greater communion, diversity, and interiority, this does not mean that this process cannot, at least for a time, be thwarted or delayed:

…In harmony with the Tao,
the sky is clear and pure,
the Earth is serene and whole,
the spirit is renewed with power,
streams are replenished,
the myriad creatures of the world flourish, living joyfully,
leaders are at peace and their countries are governed with justice.
When humanity interferes with the Tao,
the sky turns filthy,
the Earth is depleted,
the spirit becomes exhausted,
streams run dry,

---

[1] **Mark Hathaway** is an author and adult educator who researches, writes, and speaks about the interconnections between ecology, economics, social justice, spirituality, and cosmology. Together with Leonardo Boff, he is the author of *The Tao of Liberation: Exploring the Ecology of Transformation* published by Orbis in late October 2009.

the equilibrium crumbles,
creatures become extinct…
(*Tao Te Ching,* §39)

For us, then, there is no contradiction in affirming that the universe is evolving but that some human actions and institutions may at times impede that process. We can try to harmonize our actions with the Tao or we can (often unconsciously) interfere with it.

The example of large corporations is a case in point. Perhaps they cannot “escape the natural laws of the universe” – if in fact any such “laws” really exist (a point that the book disputes since the process of evolution is best characterized by habits and tendencies rather than hard and fast laws). Corporations are essentially artificial (legally constructed) “persons” that tend to be pathological because of the rules and objectives that govern them. That does not mean that those who work for these corporations, nor even those leading them, are somehow evil. Some corporations, to a greater or lesser extent, have even managed to redefine their objectives and practices in ways that may enhance our evolution toward a more just and sustainable society. Overall, though, the rules that force corporations to prioritize the generation of short-term profit (measured with distorted indicators) over all else pushes them to become machines of exploitation. Fortunately, what we have created we can also change – even though doing so presents very real challenges.

The book does not attempt to separate the “responsible from the innocent,” nor does it cast the world in terms of “us versus them;” rather, it calls all of us to recognize our own complicity in a pathological system that is destroying our planet. At the same time, though, it is fair to point out that the level of complicity of a poor peasant farmer in India, for example, is very different than that of most of us living in the overdeveloped North. Such a realization need not create divisions. As the book demonstrates, the current pathological system undermines the future of all of humanity, both rich and poor, as well as the entire Earth community. Indeed, to the extent that we awaken to this reality, our current crisis can serve to unite us all in a common purpose, and perhaps even impel us to a qualitative jump in our own evolution.

The book spends a great deal of time exploring cosmologies, not – as Wallis suggests – to justify meditative practices, but rather to understand how change happens. It does not postulate any kind of “alternative universe,” but rather a deep unifying reality that is the wellspring of the entire cosmos. We can think of this reality in different ways – as the pregnant void, the implicate order, or as the Tao. The key point, though, is that this is simply a deeper, more subtle, level of reality – not something separate from the universe we live in, but the substrate of its entire fabric.

By exploring the cosmological vision that is emerging from science and seeing its parallels in ancient wisdom traditions, it is our hope that we can come to understand transformative action in a new way that integrates both what have traditionally been considered “spiritual” practices and collective social action. In particular, the emerging new cosmology helps us to understand that our visions, our intentions, our intuitions, and our state of mind have a direct impact on the transformative potential of what we do. We need to unite analysis and deep intuitive insight to discern the right action for a given place and a given time. This is essentially an art that cannot be taught, but must be discovered through both experience and deep insight.

To work for liberation, we are called to open ourselves to the wisdom of the cosmos itself – the Tao – and allow it to act through us so we can come to consciously participate in a process leading us to greater communion, differentiation, and creativity. In this, I would agree wholeheartedly with Wallis in affirming that this book should be engaged with a contemplative, integrative eye so that we may apprehend the threads uniting superficially distinct ideas and disciplines into a holistic tapestry on a deeper level. In so doing, I hope we can help readers to truly taste the Tao and to stimulate new reflections on ways of moving us toward right relationship with each other and the entire Earth community.

Locking Down the South Bronx

Susan Belford[1]

Abstract: In this brief analysis is the intended beginning of a systemic integral analysis of the social systems and structures in use in the South Bronx, New York City. Informed by the writing of Jonathan Kozol as well as current articles in the New York Times, this analysis uses the systems theories of Talcott Parsons and Donella Meadows and the human identity work of Vern Redekop to understand the exterior and interior dimensions of systemic oppression as experienced by residents of the South Bronx.

Introduction

"Where we live, it's locked down… we can't go out and play" says 12 year old Jeremiah. (Kozol, 1995, p. 32) The theme of being "locked down" recurs throughout *Amazing Grace*. Kozol describes children being taken on day trips out of the borough only to burst into tears on their return; a Bronx school teacher notes that the aspirations of the young are "locked in" to a menial level "that suburban kids would scorn" (p. 125); freedom of movement and enjoyment of public spaces is "locked down" in the interests of security with barred gates and windows, check-points and "safety corridors" (p. 136); and in any twelve month period, in a Borough with a population of 1,203,789, approximately 130,000 men and women, 92 percent of them black or Hispanic, are "locked up" in the local 415-acre Ryker's Island prison or other city jails (p. 144). Kozol paints a compelling portrait of an oppressive urban social mechanism that appears to be dedicated to the "locking down" of a specific portion of the population, with horrendous results in terms of lives lost, blighted, and maimed. The horror of this is underscored when one realizes it is not ancient history; the current relevance of Kozol's narrative can be seen in a May 11th, 2010 New York Times headline that reads *Large stretch of Bronx highest hunger rate in the nation: survey.*

The social mechanism described by Kozol is best understood as a complex dynamic system in which "a set of things," such as the housing, health, education, and security bureaucracies, are "interconnected in such a way that they produce their own pattern of behaviour over time," (Meadows, 2008, p. 2) such as the "locking down" referenced above. Complex systems are rooted in social paradigms, "the shared social agreements about the nature of reality" (Meadows, 2008, p. 163). Systems that oppress, such as that operating in the South Bronx, breed conflict between individuals caught within the oppressive social system as well as between those within the system and those outside it.

---

[1] Susan Belford lives in Victoria, British Columbia, Canada. She is a mediator and group facilitator currently completing a Master's degree in the Civic Development and Systemic Transformation concentration in the Conflict Analysis and Engagement graduate program at Antioch University, Midwest. Jonathan Kozol's 1995 book *Amazing Grace: The Lives of Children and the Conscience of a Nation* was the professor-assigned focus of a mid-term analytical writing assignment in the program's Structures and Systems of Conflict course. The assignment was to apply course concepts in analyzing real world material. This paper was submitted as that mid term analysis.

SOME RIGHTS RESERVED

In order to generate a complete analysis of this complex system, it would be useful to adopt an integral perspective. For reasons of my context in writing it including time and space, I do not carry out a full AQAL analysis, but confine my analysis to the two sides of the four quadrant model. Although developmental levels cannot be ignored in analyses, I do not address them here because they are beyond the scope and purpose of this paper.

I will focus first on the "interior" of the integral model—the subjective and intersubjective cultural issues of myth, identity and belief that combine to generate the paradigms from which the "Bronx system" flows. Following this, I will examine the objective behaviours of the "exterior," first exploring some Bronx system dynamics at the meta level, and then examining particular aspects of the system, such as housing, to explore dysfunctions within and between structural sub-systems.

The discussion ahead requires the use of some particular terminology; on the interior subjective side, the terminology relates primarily to psychological theories of identity and belief; exterior objective terminology is largely that of the "systems" field.

Interior Subjective Definitions

Belief. Many authors (Cranston, 2000; Inglis, 2005; Kegan, 2009; Mezirow, 2000; Redekop, 2002; Taylor, 2000) include "beliefs" as one of several categories of experience that contribute to the development of identity, along with "values, culture, spirituality, meaning systems, relationships, history, imagination, and capacity to act that form the core of an individual or group" (Redekop, 2002, p. 23). These authors suggest that the purpose achieved by the belief system is the creation of a worldview by which individuals and groups make sense of their world; it is through the understanding created by this worldview that people come to make judgments and decisions about their own and others' behaviour. When certain beliefs are held by many, they become shared ideas, or paradigms, from which flow decision making and the development of policy.

Identity. The purpose of the identity system is to develop awareness of the meaning-maker—the one or ones with a belief system and world view. "Riceour argues that "dialectic between Self and Other is essential for identity." This means that we work out who we are in relation to others" (Redekop, 2002, p. 154) in a process of comparison and differentiation. We know ourselves in relation to what we know of others, and "it is through participation in community life that identity, meaning and self-worth are developed" (Dukes, 1999, p. 162).

Exterior Objective Definitions

System: A system is "an interconnected set of elements that is coherently organized in a way that achieves something" (Meadows, 2008, p.11). Typically systems nest within other systems.

Structure: A structure is the way in which the elements of a system are interconnected to create an effect. Thus, structure can be seen as the source of system behaviour. In this instance, structure relates not only to the interlocking services provided to poor Bronx residents, but to the structural relationship between those services and larger social, economic, and political policies in play in New York City and the nation.

Structural subsystem: Because each of the different social service bureaucracies or institutions which Kozol examines—health, housing, education, security, and economic structures—functions as part of the overall system structure and as its own discrete system, I have labeled these as "structural subsystems." Structural subsystems as I have described them are very different from the "Parsonsian" subsystems defined below.

Parsonsian subsystems: In his efforts to describe human society as a dynamic system, Talcott Parsons (1971) posited the existence of four overlapping subsystems relating to aspects of society. One of these, the "pattern-maintenance" subsystem, is concerned with the interior-subjective relations of the society to its cultural system. The other three subsystems are concerned with the exterior-objective. The "goal-attainment subsystem" or polity is concerned with the relations of the society to individual members. The "adaptive subsystem" or economy is concerned with the relations of the society to the physical world. The "integrative subsystem" or societal community, is concerned with achieving internal integration.

Interior Subjective: Identity and Systems of Belief

Kozol's work can be seen as a serious endeavour to "look for the ways the system creates its own behaviour" (Meadows, 2002, p. 4) Because the nature of the situation facing residents of the South Bronx appears to be a single, intractable and monolithic system, it is tempting to seek a single reason for it. Kozol draws a straight line between racism, racial segregation and conditions in the South Bronx, making a strong case that the primary reason for the continuing pervasive injustice he observes is the result of a belief system which consists of marginalization and racist attitudes toward non-white poor that allows people to "devalue other people's lives… and see as natural the shunning of the vulnerable" (Kozol, 1995, p. 186). Examples of this belief system—expressed by libertarian author Charles Murray as "some people are better than others and deserve more of society's rewards" (Kozol, 1995, p. 154)—can be found throughout *Amazing Grace*, for example, in the words of an ABC radio talk show host that "black people… multiply…like maggots on a hot afternoon" (p. 21) and in the fact that scarce funds have been made available to research "genetic links between IQ deficits of … children and their racial origins" but not to "remove lead poison (a known toxin that reduces IQ) from the homes and schools of children in the Bronx" (p. 156).

"The great luxury of segregation" is that it has become so "long-existing and accepted" that it appears invisible to all but those who suffer it. Those unaffected by it in their day to day lives can maintain a guilt-free stance and "insist that they are personally "imposing nothing on the people" of the South Bronx (p. 164). This capacity simultaneously to *deny personal racism while benefiting from systemic racism* is indicative of a fault line in the American identity, a "chasm of misunderstanding that exists between the races" (Obama, 2008) that, rooted in history, is perpetuated by cultural myth.

The roots of America lie in a British colonial empire that took the land of subjugated native populations and transported people as slaves around the globe. Slavery was an established fact of

American culture before the United States became a country, and continued until the passing of the Thirteenth Amendment in 1865. This long history of enforced racial difference is the ground from which the systems in the South Bronx grew and which nurtures them today. In writing about the black experience of colonialism, Franz Fanon eloquently expresses his despair of ever being understood, or being able to understand *himself,* within a cultural context that designates him as “the missing link in the slow evolution from ape to man” (Fanon, 1953, p. 1). Describing the bifurcated way that a black person understands his or her own identity—in relation to other blacks and, separately, in relation to whites—Fanon suggests that whites do not have a similarly fractured way seeing the Self; from their position of “superiority,” they are able to define all others (Fanon, 1953). Gail Low, exploring white myth making in Victorian literature, notes that to ignore racist writing is to leave “untouched the psychic investments which determine the formation of the fictions that sustain the world we live and act within” (Low, 1996, p. 2). The cultural legacy is one in which whites are entitled and blacks victimized by a fractured, negative, internalized self image and modern American mythmaking has done nothing to alter these dynamics. In spite of the civil rights movement, the advent of Black Power, the increased television presence of blacks and the many genuine racial “firsts” of recent years, the paradigm of “indolent, warlike Africans” best enslaved for their own good (Low, 1996, chapter 3) prevails.

But race is not the only divide within the American identity; prosperity is another. The propensity to blame the poor for their poverty was also inherited from the British Colonial Empire and embedded into the revolutionary new country. Belief in a “just world” in which an individual’s actions are solely responsible for his or her economic fate gave rise to the economic ideas of Adam Smith’s “invisible hand of the market” by which an individual “pursuing his own interest … promotes that of society” (Meadows, 2008, p. 106). Today, “while 13% of Americans live in poverty, many studies show that Americans typically believe that a person’s ... economic status is due to something the person did or failed to do, therefore they deserved it or had it coming” (Coryn, 2002, p. 2). Instances of this paradigm are found in political scientist Lawrence Mead’s suggestion that the poor are in their condition of poverty because of their own “irrational” behaviour (Kozol, 1995, p. 21). They are found in media discussions about the “apathy,” “listlessness,” and lack of good “decision-making skills” among the mothers of poor children. And these discussions are “divorced from any realistic context that includes the actual conditions of their lives” (Kozol, 1995, p. 180).

In addition to the above two belief systems, there is a third set of beliefs stemming from the revolutionary years, supporting democratic principles and equality. Coming in part from those oppressed by racism and disdain for the poor, this set of beliefs is buttressed by a sizable percentage of the rest of Americans and provides additional tension within the American identity.

Intractable conflicts around the globe have their roots in paradigms that blame poor conditions on their victims, who are the object of racial or ethnic hatred and disdain. “The hegemonic systems and structures perpetuated by these paradigms objectify the subjugated, cause them to internalize a negative self image” and deprive them of “the ability to move, perceive or act freely” (Redekop, 2002, p. 275). Violence has been for the most part forestalled in the Bronx by the actions of those who hold the “third set” of beliefs indicated above. However, the possibility for violence will remain unless action is taken to redress the balance between the dominant and the subjugated. Part of that action includes seeing clearly the systems these identity conflicts generate.

Exterior Objective: Systems that Perpetuate Suffering

According to Parsons, institutions or structural subsystems of poverty, like those that generate wealth, embody and are legitimized by the values and paradigms of the society that maintains them, as "generalized" by the societal community's "pattern maintenance sub-system" (Parsons, 1971/2011, p. 195). The other sub-systems create institutions in response to these generalizations, which, at the meta level, operate nested within the larger national societal system of generalized values.

Meadows maintains that the behaviour of a system is generated by its own structures, and points to several basic "system traps" that cause systems to work in ways counter to what we expect. This logic can be applied at any systems level. At the meta level, I will limit my comments to two of Meadow's traps: "policy resistance" and "competitive exclusion."

Policy Resistance

In terms of the overarching national value system within which the Bronx system exists, the goals of the "Parsonsian sub-systems" of the societal community are at odds with one another. The goal attainment subsystem, or polity, fed by "third set" values relating to principles of democracy and equal opportunity has for decades taken action against racism through the desegregation of schools, affirmative action, the striking down of exclusionary zoning, and the passing of such mechanisms as the Community Reinvestment Act. However, the goal of the adaptive system or economy seeks to maximize benefit for those *already* operating effectively within the free market. Parsons notes that "money and markets operate...where spheres of action are sufficiently differentiated from ... moral imperatives." (Parsons, 1971/2011, p. 200). In other words, the "good policies" created by the polity are not necessarily "good business" as defined by the economy. This tension between competing subsystem goals gives rise to what Meadows calls "policy resistance" (Meadows, 2008, p. 113).

An excellent South Bronx example of policy resistance can be found in the housing structural subsystem. Measures enacted by the "polity" to support housing affordability for low and middle income residents saw the creation of public housing, in 1955, through vehicles such as the Mitchell-Lama housing program, by which local jurisdictions sold land at reduced cost to developers who received subsidized low interest mortgages and tax abatements in exchange for building affordable housing. The program allowed building owners, after twenty years, to leave the program and either raise rents or sell to other business interests. While this initiative may have been predicated on the notion that incentives stimulate the making of private decisions that contribute to the public good—a kind of subsidizing of the market's invisible hand—the actual result was the perpetual cycle of building and decay so clearly described by Kozol. On reaching the 20-year mark, owners regularly withdrew from the program and sold to parties who either increased rents or reduced their costs by cutting routine maintenance. When the buildings became completely derelict, they were razed and replaced with great fanfare with a new set of buildings. The latest of these is 1520 Sedgewick, which, after providing for 30 years 102 units of "much desired, affordable housing for working-class families" has seen, under new owners, the number of housing code violations increase by more than 600 percent (Medina, 2010). The goal of the polity to provide affordable housing didn't take into account the dictates of the market economy by which business seeks to optimize advantage. This same dynamic occurred within city owned housing: the goal of providing affordable housing for the poor was undermined by the need for "efficient use of resources" or reassignment of resources to other purposes. Policy resistance is also reflected in health and education, whereby the polity goals to increase well-being are undermined by "management of resources" that continually cuts budgets for staff and building maintenance or diverts funding to other needs.

Competitive Exclusion

Simply put, competitive exclusion allows the "rich to get richer." Meadows explains that this system trap is "found whenever the winners of a competition receive, as part of the reward, the means to compete even more effectively in the future" (Meadows, 2008, p. 127). In *Amazing Grace*, this dynamic in most eloquently illustrated through the 1994 budget cuts for residential services such as sanitation, building inspection and pest control throughout New York. These cuts, which bankrolled tax cuts for the wealthy, hastened urban decay in poor areas and threatened public health with piles of garbage, uninspected buildings and a major increase in the rat population. (Kozol, 1995, pp.100, 107, 109). Inhabitants in wealthy areas were lauded for their ability to purchase sanitation services privately through "improvement districts." Inhabitants of poor areas, unable to create "improvement districts," were blamed for spiraling neighbourhood decay.

Competitive exclusion is also evident in New York City's public school system. Between 1989 and 1992 "a billion dollars was cut from the city's school budget" with the result that the children from one Bronx school had no building to attend and were "housed in an abandoned skating rink that had no windows" (p. 153). During this same period, $150,000,000 was spent to build the "dazzling new structure" of Stuyvesant High school, an elite public school that overwhelmingly serves "the children of Manhattan's Upper East Side." Competitive exclusion in the school system continues today, with Stuyvesant parents (who are able to contribute $300,000 annually to the school) having been recently awarded the right to qualify for federal financing reserved for the poorest schools (New York Times, 11/05/2010). By mechanisms such as this, "inequitable distribution of income, assets, education, and opportunity" is perpetuated and the poor receive a

> disproportionately small part of government expenditure... Ideas and technologies come to them last. Disease and pollution come to them first. They are the people who have no choice but to take dangerous, low-paying jobs, whose children are not vaccinated, who live in crowded, crime-prone, disaster-prone areas. (Meadows, 2008, p. 129)

The Mechanics of Structural Subsystems in the South Bronx

Thus far, I have addressed system dynamics at a meta level. In this section, I will examine the functioning of three structural sub-systems that Kozol describes—housing, health and education— and the ways that these interact to contribute to the growth of hopelessness, illness,

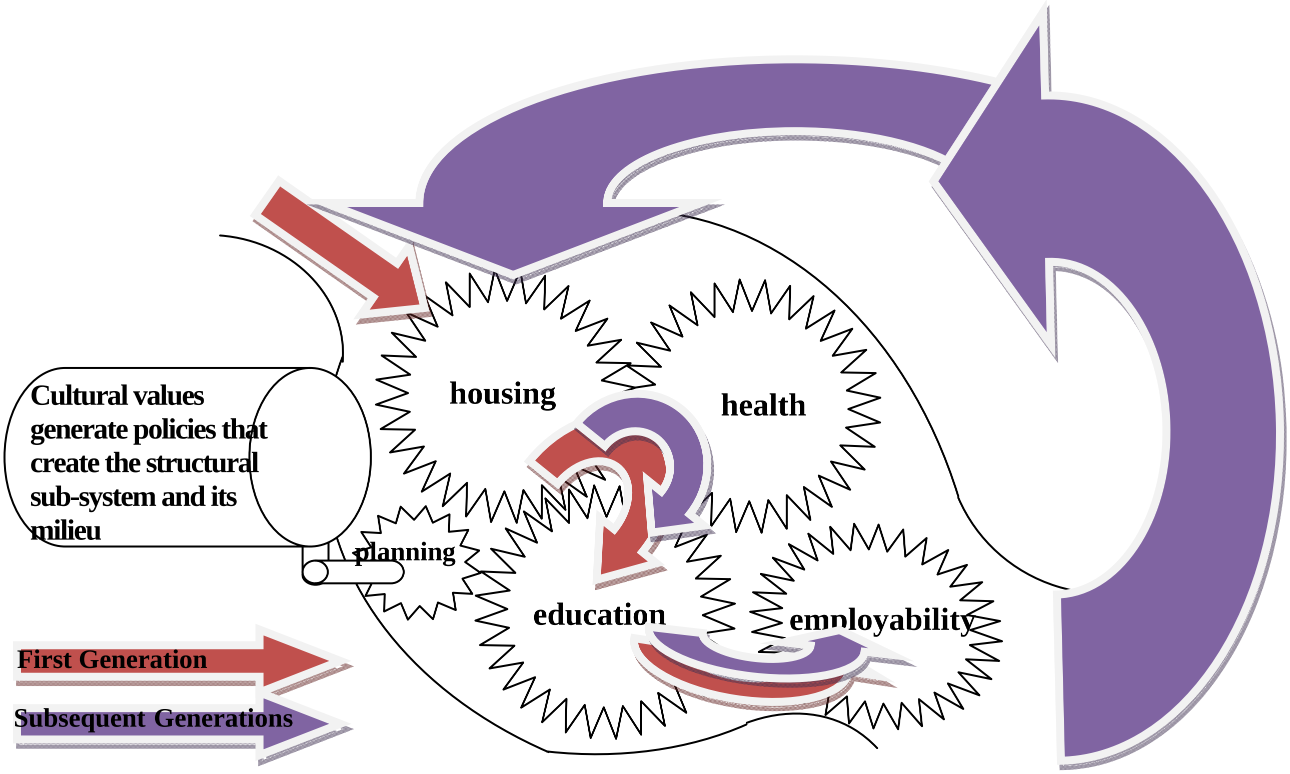
illiteracy and poverty. Each of these subsystems has the creaky feel of Gotham city-style bureaucracies: paperwork is lost, errors are made, functionaries cut corners and clients are given confusing, contradictory or simply wrong information. Each displays what Meadows would consider serious systems traps; chief of these is the phenomenon of “race to the bottom” (Meadows 2008, p. 122). Briefly put, this happens when a negative evaluation of a system is met, not with corrective action, but with lowered expectations which further reduce action, and the system drifts gradually downward in a vicious cycle. This system trap can be seen in the progressive cutting of funds to maintenance budgets in the public housing and the education systems and in staffing budgets of education and health systems. Some of these dynamics are captured in Figure 1.

It is in the interactions among the systems that the harm is really done, however. The downward spiraling housing system situates children in mouldy, lead contaminated apartments, causing them to suffer serious physical and mental health conditions, which contribute to cognitive impairments and absenteeism from school, which ultimately results in withdrawal from school. Likewise, lack of medical facilities exacerbates health problems from the home and school environments and further damages educational prospects, and, ultimately, employability.

Each of the subsystems are nested within meta systems flawed by policy resistance and competitive exclusion, which yields an overall planning system that perpetuates the creation of substandard housing and locates harmful industrial installations within residential communities, increasing harms to health. The action of these systems together is not unlike a meat grinder, except that the output of the South Bronx grinder (Figure 2) is recycled as future generations of people.



Cultural values generate policies that create the structural sub-system and its milieu

Conclusion

The transformation of complex systemic dysfunction such as that in the South Bronx can only be achieved with lengthy, careful, integral attention to the whole system that reconciles the interior-subjective paradigms of race, prosperity and democracy within the American identity and restores coherence among the society's subsystems. With dialogue and discourse gaining popularity across the country, it may yet be possible to eradicate the notion that the horrendous "Bronx system" is simply illustrative of a system doing effectively what it was designed to do.

Emerging Perspectives of Metatheory and Theory: A Special Issue of Integral Review

Steven Wallis

A New Focus

Welcome to this special issue of *Integral Review*. Here, we have encouraged contributions from a diverse group of serious thinkers. Their peer-reviewed contributions provide a broad range of insights into the emerging field of metatheory. Metatheory is an important field of study because each person's metatheoretical perspective shapes the way she or he understands theory. And, the way we understand theory influences how we create, validate, test, select, and apply theory to improving ourselves, developing goals, and working to optimize the human (and post-human) condition. Without consciously understanding metatheory, we lack a "second loop" of learning – a second level of awareness.

Generally, our experiences give rise to concepts, which we combine, into theories. Theories are like lenses we use to view and engage the world (and ourselves). Having better theories means we are better able to engage the world around and within us. Despite the obvious importance of theory, few have taken the time to understand what it is all about. Engaging theory as a topic of study instigates an important recursion in human thought. Such recursions open the door to revolutions in understanding. For example, what if you changed your nation's policy on how it makes policy, or changed your ethic for changing your ethics?

Here, we investigate our theories about what constitutes a good theory. This approach is conceptually similar to second-loop learning – or learning how to learn. Clearly, if one learns how to learn more effectively, one can learn more quickly and more deeply. This can save a great deal of time (and tuition) and allow one to apply the learned knowledge sooner. This too, is a potential usefulness of metatheory. By using our lenses to look at our lenses, we can create better lenses. Continuing, we may accelerate the process of lens-improvement. With metatheory, we can accelerate the process of theory-improvement. And, thereby, we can accelerate our understanding, self-improvement and conscious co-evolution. Finally, these changes are desperately needed in an era where such understandings are desperately needed and hotly contested.

In this special issue, some authors adopt an approach to metatheory where they essentially combine and integrate multiple theories. Other authors adopt an approach where they use one theory as a lens through which to view (and gain insights into) other theories. A third general theme includes conversations around how we can best engage this thing called metatheory. All of our authors take on this difficult and complex task of understanding theory, integrating theory, and advancing the field of metatheory. My hat is off to each of them, for they are bold explorers in a new field of study.

SOME RIGHTS RESERVED

We begin with a paper by **Zachary "Zak" Stein** who suggests a philosophical metatheory by investigating the history of metatheory. Exploring a rather interesting idea about metatheory and metatheoreticians he asserts that we are concerned with nothing less than the “trajectory of knowledge production processes.” And, with our metatheoretical perspectives and metatheories, we serve a normative function – guiding and enhancing academic discourse. Importantly, his reflections help us to understanding metatheoreticians – helping to define the field and helping us to learn who we are.

In the process of investigating a theory, one must adopt some conceptual stance. **Stratos Ramoglou** presents an investigation using two such stances to evaluate one theory within the field of organizational studies. One approach is founded on a constructivist view while the other is pragmatic. He shows that it is possible that these metatheoretical approaches can find themselves in conflict, thus raising difficulties for the analyst. To resolve this conflict, Ramoglou presents a third metatheory, an emancipatory perspective, which serves as a “tie breaker” and possibly suggests an evaluative perspective that is more effective than the other two. In plain language, it may be that we do not have (and may never have) all the answers to the uncertainty of the world. Yet, we must engage it. There may be no way to avoid the use of some metatheoretical model. And, emancipatory values allow for the emergence and engagement of new ideas. This, in some sense, cuts through a difficult dilemma. Instead of asking, “Is this true or not?” his approach suggests that we may benefit most by accepting the idea based on the benefits that such a belief may provide.

In another example of an emancipatory perspective, **Carter Haynes** adopts a high-level approach to identify the limitations of positivist research in the analysis of complex, subtle, social systems. Specifically, and appropriately, his exemplar here is fundamentalist religions. He draws an interesting parallel between religious fundamentalism, and positivism – where positivism may be understood as a sort of an academic fundamentalism. Haynes goes on to describe a variety of qualitative methodologies and, importantly, suggests that epistemological flexibility and metamethodology are useful supports for critical analysis and the building of more effective metatheory.

Instead of looking at a metatheory as a combination of perspectives that describe an overarching perspective, **Alan Singer** looks at a metatheory as a set of under-girding commonalities – something that connects and integrates core ideas of multiple perspectives from multiple perspectives. His paper is more complex than most in this special issue and his many insights are well worth reading. Here, Singer is focused on business strategy as a form of metatheory. He demonstrates by careful example how metatheorizing might be used to combine strategy, ethics, and more. He also suggests the importance of metatheory as part of a formal educational process to help students understand and integrate ideas across disciplines.

The importance or usefulness of metatheory depends on how effectively the field of study is developed. In the next paper, **Steve Wallis** provides an outline of metatheory’s standing as a science; and, what we might do to advance the study of metatheory. He includes modern, postmodern, and integral approaches to science and so opens the door for greater synthesis and extensions of this emerging field. Usefully, he reviews a wide range of metatheoretical methodologies from critical and appreciative perspectives, while highlighting those that appear to the most effective in developing more rigorous theory and metatheory.

It is interesting to note a German-English connection in the growing field of metatheory. Authors from previous issues of the *Integral Review*, such as Markus Molz and Wendelin Küpers, are joined in the present issue by **Karim Fathi**. Fathi's paper, in German, investigates two approaches to conflict resolution. Importantly, he consciously applies a specific model to investigate the integration of those approaches. That model, an Integral Approach based on Wilber's AQAL model, clarifies important aspects of the conflict management approaches. He finds that this approach is useful for integrating multiple theories. Specifically, he finds that AQAL (in its present form) lacks categories that appear necessary to understand the process of conflict resolution. Thus, Fathi opens the door to advancing both conflict resolution theory, and integral theory. And, like Singer's work in this special issue, suggests that researchers should be familiar with a variety of epistemological, metatheoretical, and practical approaches. For those who do not read German, Karim has thoughtfully provided an extended abstract in English.

Special Section – Combining the Combinations

An important part of metatheory is the process and product of combining and integrating multiple theories. In this special section, we begin with three papers – looking at three metatheories where the authors have used their understanding of metatheoretical methodologies to integrate theories within disciplines. The fourth paper takes the additional step of integrating the three across disciplines. Both process, and results, provide valuable insights to those interested in metatheory, transdisciplinary studies, and (of course) each of the specific fields of study addressed directly in the papers.

In the first paper, **Annemie Ploeger** begins with evolutionary psychology, which has already been advanced as a metatheory. In this, she asks a question that is often asked by theorists and metatheorists, alike: Why has this metatheory not been widely adopted? Importantly, she draws useful conclusions as to how a theory works (or does not work) within a discipline and opens the door for interesting conversations and explorations into the effectiveness of metatheory within the social sciences.

In the second paper, **Mark Antley** investigates the field of human development. He uses complexity theory as a lens to interpret, and find linkages between, multiple theories (as developed by Bandura, Sameroff, and Erickson). Mark finds this approach useful for identifying contradictions and inconsistencies between theories; which, itself, points to a useful tool for metatheoretical studies. That understanding, importantly, represents a purposeful and metatheoretical approach to identifying opportunities for advancing theories and disciplines.

Latha Poonamallee begins the third paper of this special section with the recognition that paradox and contradiction between competing theories creates a challenge to the creation of metatheory. She proposes a resolution to this issue that involves the adoption and implementation of a metatheoretical stance based on advaita (non-dualism). Through her investigation of the epistemology, ontology, and praxis of advaita, she develops an intriguing line of inquiry balancing spirituality and metatheory. Practical implications are also suggested that may be applied to individuals, communities, and combinations of approaches to research.

In the final paper of this special issue, **Annemie Ploeger** provides an essay with a bold and intriguing goal – she seeks to integrate the three metatheories of this special section. Her effort points to some of the exciting possibilities, as well as some of the inherent difficulties, of this kind of process. From her effort, it seems that it is easier to integrate theories that share a common intellectual heritage (evolution and systems, in this case). It is more difficult, though not impossible, to integrate those metatheories with advaitic approach. Another difficulty may be in linking different "forms" of conceptual constructs. In this case, evolutionary theory and systems theory are fairly well advanced as "theories." In contrast, the advaitic approach is more of a philosophy (including elements of ontology, epistemology, and more).

Toward the Horizon

These authors do not engage in an easy task. Metatheory is an emerging field and our scholars are explorers. Explorers who purposefully eschew the daily commute in exchange for a challenging voyage on uncharted seas. In this, they are not merely mapping uncharted territory; they are also exploring what it means to have a map.

This kind of exploration does not occur with great frequency. Indeed, for the social sciences, this may be the challenge of the millennium. To help us meet that challenge more effectively, we need new ways to identify the topology of our “conceptual constructs.” If our experienced world oscillates between relativism and determinism, is it possible to point to something and unarguably identify it as a philosophy, paradigm, theory, ontology, or fact? And, what if those things may be recognized as facts from a relativist perspective, but theories from a deterministic one? Those designations may become “moving targets” that may change depending on the context in which they are observed or used.

On one level, such questions may appear to generate quite simple answers. One might simply say, “I know it when I see it – and there it is.” On another level, the interrelationships between these conceptual constructs makes that process as difficult, and as important as defining one’s relationship with the universe. To merely think about such relationships, tends to change them.

To conclude, it is important to note that each of the articles in this special issue is developing, presenting, or using a methodology for the combination and/or analysis of theory. These exercises advance our understanding of metatheory and theory, thus advancing the field of metatheory and improve our ability to understand and develop theory to optimize the human condition in concert with our planet.

My profound thanks to the authors, reviewers, editors, and publishers of *Integral Review* for their encouragement and support in the creation of this special issue. It is rare to find this blend of brilliance, dedication, and empathy. And, I feel that we are all better for their efforts. It is my hope that the examples and insights presented in these articles and essays will enable and encourage you, the reader, to become a conscious and active participant in the nascent field of metatheory.

On the Normative Function of Metatheoretical Endeavors

Zachary Stein[1]

Abstract: I reconstruct an historical understanding of metatheory that emphasizes its *normative function.* The pioneering work of James Mark Baldwin inspires an account of how metatheoretical constructs emerge developmentally and come to serve a discourse-regulative function—overseeing, organizing, and regulating whole fields of discourse. Then I look to Charles S. Peirce as an exemplary normatively oriented metatheorist and explain how both continue a philosophical tradition concerned with the normative function of humanity more broadly. Thus, while I think it is valuable to pursue a variety of metatheoretical endeavors, including descriptive and empirical ones—mapping the terrain of various discourses, or summarizing their contributions—I argue for a specific vision of metatheory as a *normative* endeavor with rich intellectual and historical precedence. Unpacking some of the implications involved with this way of viewing and doing metatheory lead to considerations about the differences between two general types of metatheory (scholastic-reductionist and cosmopolitan-comprehensivist), the role of philosophical interlocutors in the public-sphere, and the trajectory of human evolution in the coming decades.

Key words: Charles S. Peirce, Integral Theory, James Mark Baldwin, metatheory, normativity, 19th Century thought.

Introduction: We metatheorists?

> [With] self-consciousness comes the possibility of *transforming* ourselves by adopting new vocabularies, redescribing, and so reconstructing our selves and discursive institutions. While all of us are in some sense *consumers* of such new vocabularies, it is the special calling of some to *produce* them. And among those producers some take the construction of unique, potentially transformative vocabularies as the project by commitment to which they understand and define themselves. Among that group, some seek to produce those new vocabularies precisely by trying to understated the phenomena of sapience, normativity, conceptuality, reason, freedom, expression, self-consciousness, self-constitution, and historical transformation by subversive, empowering vocabularies. Those are the philosophers. They are charged neither with simply understanding human nature

> (human history), nor with simply changing it, but with changing it *by* understanding it. (Robert B. Brandom, 2009, p. 150)

In general, we humans are a self-interpreting species for whom the practice of recollecting and redescribing ourselves is a crucial necessity. For us the reconstruction of identity is a continuous process wherein the *past* is selectively crafted into a *history*. It is a creative and self-constitutive exercise. We come to know each other and ourselves not by exchanging resumes (mere inventories of events), but by telling our stories. And our stories change as we do; they reflect what actually happened and what we think is worth remembering, they reflect who we were, who we are, and who we would like to become. Neglecting this retrospective task results in identity confusion, leaving us fragmented, meandering, directionless. Some argue that the species as a whole faces an impending identity crisis as the unchecked proliferation of informational and biological technologies create abrupt discontinuities in the intergenerational fabric of the lifeworld, catapulting us out of history and into forms of life that are incongruent and incomprehensible (Habermas, 2003; Fukuyama, 2002). These concerns about possible futures appear realistic when they are seen in the context of the obvious identity confusions that already characterize large swaths of the academy, especially in the humanities and social sciences (Kagan, 2009; Menand, 2010). The disciplines traditionally responsible for the self-interpretation of the species do not have a coherent self-interpretation themselves.

This paper is a preliminary articulation of how I think we metatheorists should understand our endeavors. I articulate this self-understanding by pointing to certain specific historical figures and their ideas, which I think exemplify the character and trajectory of our field. This proposed self-understanding addresses both aforementioned loci of identity confusion. Remembering (recollecting and redescribing) who we are as metatheorists should go a long way toward bringing order to the disorder and fragmentation of the academy. It should also allow for the emergence of profoundly substantive and coherent voices in a public sphere that is increasingly irrational, inarticulate, and superficial.

What follows is a certain type of scholarly intervention. It involves an historical reconstruction of core intellectual themes that have shaped a given field, addressing this reconstruction to participants in that field, and thus affecting how they understand their efforts. Both Brandom (2002; 2009) and Habermas (1971) have executed projects of this type—in philosophy and critical theory respectively—and both have discussed the unique methodological issues involved. Historical reconstructions of this kind are not uncontroversial. As mentioned above, and unpacked in the methodological clarifications of both Habermas and Brandom, the *past* must be crafted into a *history*. The reconstruction of a cumulative trajectory or tradition is both a discovery and a creation. It is also both descriptive and prescriptive. We remember what we think is worth remembering, which depends in part on who we want to become, yet who we want to become is a reflection of who we think we have been all along. This kind of complex hermeneutic exercise is indispensable for assuring the continuity of intellectual traditions. Retrospective reconstructive work sets the necessary staging for concerted constructive efforts.

Importantly, these kinds of reconstructions are always partial. The story I tell here is but *one* story (and a regrettably brief and unelaborated one at that). There are other stories worth telling. And I encourage the reconstruction of different stories. In one sense this paper can be read as having a merely *expressive* intent, as opposed to its being read as if it were crafted to persuade or convince. Taking it this way amounts to seeing it as akin to the declaration: “This is how I understand what I am doing. Who is with me?” This does not mean what follows is arbitrary or irrelevant, or that it cannot be persuasive. The long tradition of expressive philosophical projects—from Schelling, Nietzsche, and Emerson through Derrida, Rorty, West, and Brandom—would suggest quite the opposite. Many have been *influential* while yet only claiming to express themselves, especially regarding issues too deep to really argue about. So while I am adopting a somewhat unconventional argumentative strategy, it is not an unreasonable one.

I have adopted this argumentative strategy mainly in response to the state of the discourse surrounding the term *metatheory*, which has been so variously characterized (e.g., Edwards, 2008; Fiske & Shweder, 1986; Overton, 2007; Ritzer, 1991; 1992). At first pass the term can simply be understood as referring to a type of super-theory built from overarching constructs that organize and subsume more local, discipline-specific theories and concepts. Roughly: whereas a theory within a discipline typically takes the world as data, metatheory typically takes other theories as data. Beyond this first pass, however, the discourse about metatheory gets very complex very fast (see Rizter, 1992). A highly abstract, ornate, and self-referential academic niche has emerged. And as a result there has been a flowering of interesting intellectual work concerning metatheory. This is not a situation unique to the discourse about metatheory. Nor do I write this intending a criticism of the field. This is how things stand in most fields, even those with seemingly straightforward subjects, such as *human memory* (see: Hacking, 1995).

But things get even more complex and contested if *philosophy* is not partitioned off from metatheory (a move I have never seen justified) and if the whole discourse about *interdisciplinarity* and *transdisciplinarity* is also thrown into the mix (e.g., Gibbons, Limoges, Nowontny, Schwartzman, Scott, & Trow, 1994; Klein, 2005, Stein, 2007). When the net is cast broadly what comes into view is an expansive and unprecedented proliferation of reflective activity about knowledge production processes in post-industrial socio-cultural contexts. The task of cataloging the various genus and species that populate this intellectual landscape is a daunting one. And the idea of offering some new theoretical creature that might survive seems misguided, as the diversity on the current scene suggests probable redundancy. So my strategy has been to look back to a time before the Cambrian Explosion, as it were—a time before the contemporary cacophony—to find the key progenitors in hopes that this approach might allow for clarity about the core properties that characterize metatheoretical endeavors.

What results, I think, is a compelling account wherein metatheory is understood as a unique extension of more traditional modes of philosophy. First emerging in America in the later half of the 19th Century, metatheory grew up as a response to advances in psychology that would transform epistemology, and to socio-economic transformations affecting the institutionalization of knowledge production—the birth of the complex departmentalized research university. It emerged to serve a normative function as a result of cognitive, disciplinary, and discursive necessities, ultimately positioning itself as a locus of responsibility for setting the trajectory of high-level discourses and reflective cultural practices. Of course, today metatheorists claim to be doing all kinds of things, such as serving descriptive, deconstructive, or even decorative functions. I am aware of the various ways we metatheorists might understand ourselves, but I choose to offer a vision that emphasizes the distinctly normative core of metatheoretical endeavoring. Others are welcome to tell stories that construe metatheory differently, perhaps as a more recent and poly-focal form of academic activity. I personally prefer to see metatheory as the continuation by new means of classic philosophical efforts, where highly reflective individuals take responsibility for discursively constructing conceptual innovations aimed at bringing coherence to the state of knowledge for the sake of shaping human history.[2]

Below I profile James Mark Baldwin and Charles S. Peirce, characterizing them as key progenitors of contemporary metatheory. They both self-consciously appropriated and transformed the philosophical traditions they inherited in order to address the rapidly changing contexts of knowledge production they faced. The results are best understood as metatheoretical endeavors that are explicitly related to a specific philosophical tradition concerned with the function, role, and purpose of humanity in an evolving universe. So Peirce and Balwdin are two of the missing links (though there are others) that relate contemporary metatheory to the full richness of its philosophical inheritance. I will offer more on that philosophical tradition in the penultimate section below. First I will briefly explain Baldwin's metatheoretical ambitions, including a look at his model of human development, which was, in part, an account of the genesis of metatheoretical constructs. Then I will discuss Peirce’s philosophical work as a way of demonstrating Baldwin’s ideas about the normative function of metatheoretical constructs that are understood as high-level emergent properties of cognitive developmental processes. Peirce’s work exemplifies the kind of normatively oriented metatheory that was (and still is) struggling to emerge and to meet the needs of our self-interpreting species, which must create the metatheoretical languages it would use to re-create itself.

Baldwin's Dictionary and His Views of the Higher Stages

> We see experience establishing, of itself, a synthetic mode of apprehension. To our mind, the course of the history of thought makes it plain that the quest for such a mode of experience presents the only hope of a lessened strife among points of view; for in such a mode of process evidence would be present to show that the entire system of experience is expressive of reality, and that only in the organization of the whole are the respective roles of this and that function to be made out. [Thus] the need of carrying out to their legitimate outcome all the hints that consciousness gives as to its unreduced and undivided epistemological calling. [This calling] does not deny the epistemological value of any of the mental functions, or the force of any of the theories which are based respectively upon one or other of the functions; on the contrary, its aim is to discover the synthetic adjustment of their claims with the larger whole. (James Mark Baldwin, 1915, p. 226)

---

[2] It may be that I am merely reconstructing part of the lineage of a certain *type* of metatheory. Perhaps the type of metatheory I am reconstructing here is better understood as a species of *philosophical* metatheory, which can be set apart from *scientific* metatheory (Ritzer, 1991). Or perhaps it should be called, *integral* metatheory (Edwards, 2007; Esbjörn-Hargens & Zimmerman, 2009; Hamilton, 2008; Laszlo, 2004; McIntosh, 2007; Mascolo & Fischer, in press; Wilber, 1995; 1999). I have no objections to the idea that what follows is merely a reconstruction of a certain *type* of metatheory. It may be that what I have in mind is not even metatheory, but a kind of philosophy. Call it what you will in the long run, I call it metatheory here for rhetorical purposes. I return to this issue in the conclusion.

James Mark Baldwin was a massive figure on the intellectual scene of his day. During the height of his influence he was mentioned in the same breath as William James, John Dewey and Pierre Janet, on both sides of the Atlantic. He was arguably the most significant American psychologist of the 19th Century—while James gave psychology a face, publishing the indelible *Principles of Psychology*; Baldwin gave it legs, institutionalized it, building labs and starting journals. His writings were widely cited, translated into many languages, and several of his books were considered as standards in the field.[3] And though his theories have had a lasting impact on a variety of areas—from developmental psychology (Kohlberg, 1981; Piaget, 1932) and psychoanalysis (Lacan, 1977) to evolutionary biology (Weber & Depew, 2003), evolutionary epistemology (Campbell, 1987), and integral theory (Wilber, 1999)—he is not the household name he once was.

Given his former stature and the continuing relevance of his ideas, many have speculated about the reasons for his present obscurity (Broughton & Freeman-Moir, 1982). A scandal did leave him blacklisted in American academia, and his departure did clear the way for behaviorism, as John B. Watson assumed control of Baldwin's prestigious faculty position and numerous journal editorships (see: Wozniak, 2001). However, Baldwin did continue to write prolifically while exiled in France, was eventually elected a foreign correspondent to the French Academy (the highest honor that can be given to a non-citizen), and then bestowed the Legion of Honor for his charity and relief work in France during World War I. The standard story is that institutional rearrangements and broad changes in the academic *Zeitgeist* secured his fate as a footnote in the history of psychology. There is certainly a moment of truth in that account, but there is a deeper reason for Baldwin's neglect, I believe. It has to do with the fact—and the parallels with here Peirce are remarkable, as I will show below—that he was doing metatheory when it was unacceptable to do so.

His later works are nearly universally considered to be obscure, speculative, and worthless to contemporary psychology (Boring, 1922; Richards, 1987; Weber & Depew, 2003; although see: Broughton & Freeman-Moir, 1982). [4] This is, I believe, because these works (Baldwin, 1911, vol. 1-3; 1913, vol. 1-2; 1915) unlike his earlier works (1895; 1897) are not offered in the spirit of experimental psychology. Baldwin's later works are offered as metatheoretical interventions, aimed at organizing the existing state of discourse in the human sciences, biology, and the humanities into a common framework, a *comprehensive developmental theory of reality*.

Baldwin's moves beyond psychology toward metatheory were undoubtedly catalyzed by his work as editor of the *Dictionary of Philosophy and Psychology* (Baldwin, 1905).[5] The *Dictionary* stands as one of the most impressive trans-national scholarly efforts ever. Explicitly comprehensive in its ambitions, its four massive volumes cover the majority of academic knowledge that existed at the turn of the last Century. It contains contributions from hundreds of academics on well over a thousand topics, serving as a veritable *who's who* and *what's what* for the 19th Century academy. The *Dictionary* remains unrivaled as a scholarly achievement in certain respects—getting a remarkable amount of knowledge under one roof, with attention to codifying common terminology and efforts at clarifying the structure of the epistemological relations between the disciplinary perspectives in play. And Baldwin oversaw the entire project, making emendations or substantial contributions to almost every entry.

---

[3] For an account of Baldwin's life and work see: Boring, 1922; Richards, 1987; Wozniak, 2001.

[4] Yet even Broughton only really pays attention to the first volume of Baldwin's three-volume *magnum opus*.

[5] For an account of how profoundly the project affect Baldwin's thought see: Wozniak, 2001.

Importantly, the ambitious encyclopedic effort coincided with Baldwin's appointment to John's Hopkins University, the first modern research university in America. This was a dynamic time in the history of academic institutions (Cremin, 1988; Kerr, 1963; Menand, 2010). The sciences began to gain hegemony and the disciplines were subdividing and multiplying at a dizzying rate. No student of 19th Century thought can ignore the profound and pervasive impacts resulting from the professionalization and concomitant departmentalization of knowledge production in the years immediately preceding the publication of Baldwin's *Dictionary*. It was in these years that the academy began to assume the shape it has today, with a vast array of siloed, specialized disciplinary areas. It is hard to see Baldwin's *Dictionary* as anything but a response to what was becoming an increasingly fragmented and sprawling intellectual landscape, an unprecedented academic landscape he found himself in the middle of at Johns Hopkins.

But while he was in the middle of it institutionally, he was also in the middle of it theoretically, as his interests turned at this time toward articulating a metatheoretical developmental epistemology. He moved beyond the focused experimental orientations that characterized his earlier psychological works. Baldwin begin to construct an overarching model that could account for the wide variety of knowledge he was compiling for the *Dictionary*, the various types of validity-claims, and the related methods of investigation. Moreover, it was a model that would ultimately account for his *ability* to organize this knowledge, providing an account of the genesis of metatheoretical constructs as high-level emergent products of cognitive developmental processes. From where I sit it is critical to see—although it is often overlooked—that the publication of the *Dictionary* immediately preceded Baldwin's work on *Thought and Things* (1911, Vol. 1-3).

In *Thought and Things,* his *magnum opus,* he offers a *convergent view* of human epistemological development, putting forward a model in which the higher-stages are mainly integrative and reconciliatory—functioning to transcend the dualisms and differentiations carefully and necessarily built up as the child develops in relation to culture and nature. Baldwin suggests that psychological growth is best thought of in terms of different *lines or domains of development*, which he refers to as *developmental modes*. Each mode is a relatively distinct skill or capacity, exercised in relation to different aspects of reality. Modes cluster together because they have similar external *controls,* thus forming distinct object domains. Different disciplines, methods, and their related validity-claims can be organized in terms of differential mode-recruitment profiles. And at a more abstract level this same strategy provides Baldwin with a way to build a system of epistemological categories. At its highest reaches the model contains a central division between *logical* and *practical* modes—a distinction that retrofits Kant's differentiation of *theoretical* and *practical* reason. This is the difference between science and morals, between objectivity and inter-subjectivity; I-It set apart from I-Thou-We. For Baldwin (and others, e.g., Habermas and Wilber), the two most basic modes of development are those that cluster around objects (I-IT; objectivity) and those that cluster around people (I-Thou-We; intersubjectivty/subjectivity).

In any case, late in the life course, according to Baldwin's model, these different lines reach a point of complexity and divergence such that they call for the creation of a specific type of new concept, built to transcend but include the differences between the logical and the practical—to reconcile science with the perspectives of the lifeworld. New constructs emerge and begin serving a discourse-regulative function—overseeing, organizing, and regulating whole fields of discourse. With a nod to Kant, Baldwin characterizes this emergent developmental capacity as the *aesthetic imagination*. In Baldwin's words:

> The outcome of our investigation, broadly stated, is that in the aesthetic imagination . . . *the processes of experience [can] come together after having fallen apart.* Each of the cognitive modes [i.e., lines] . . . sets up, as is its nature to, a reference in which *the real for it, its real, is found*. But in each case *its real*, not *the real*, is postulated or presupposed, since the control that is discovered is the outcome of this or that special mode and stage of psychic function. The protest of the aesthetic imagination is against just this partialness of each of the modes of "real" meaning. Its own ideal, on the contrary, is one of completeness, of reunion, of *reconciliation*; it gives us the "real" which is absolute in the sense that its object is not relative to, and does not fulfill, one type of interest only to the exclusion of others. (Baldwin, 1911, Vol. 3, p. 13)

In Baldwin's model the aesthetic imagination emerges during the course of late-stage cognitive and socio-moral development. It leads to the construction of a variety of *trans-logical* and *trans-practical* constructs. These constructs function across multiple domains and disciplines to oversee, integrate, and regulate important reconciliatory syntheses. For example, Baldwin states that at this stage the individual begins to yearn for views that overcome the distinctions between mind and body, theory and practice, and the ideal and the actual.

Most relevant to this discussion is what Baldwin called *theoretical intuition*, a name he gives to what results when the aesthetic imagination is exercised in the domain of theoretical or logical pursuits, such as science. As Baldwin describes, "By theoretical intuition is meant the immediate apprehension or perception of rational principles as such, these principles being looked upon as constitutive or regulative of knowledge" (Baldwin, 1911, Vol. 3, p. 234). Thus, according to Baldwin's developmental model, whole theories, methods, and discourses come to be regulated by the products of late-stage psychological growth. A capability comes online that allows for the creation of metatheoretical constructs that serve a normative function.

This way of understanding the higher reaches of human epistemological development would buoy Baldwin’s continued metatheoretical endeavors, most notably his ambitious attempt at building a *comprehensive developmental theory of reality* (Baldwin, 1915). According to this vision, human experience, as elaborated through cultural evolution, is the apex of cosmic evolutionary development, giving a unique significance to our moral, epistemological, and for Baldwin most importantly, our aesthetic strivings. For Baldwin, with homage to Kant’s third *Critique* and the Romantics it inspired, it is in the reconciliatory immediacy and world-disclosing power of aesthetic experience that the fullness of reality is revealed, transcending but including all the partial modes of experience built up over the course of biological, cultural, and individual evolution. Thus do the aforementioned *aesthetic imagination* and its *theoretical intuitions* function to guide the trajectory of cultural evolution. And so the function of humanity in the natural world is a normative one—to redeem, reconcile, and resuscitate the full reality and meaning of the universe. But this is getting ahead of our story.

For now it should be noted that Baldwin's theorizing ate its own tail. He offered a theoretical account of the very cognitive processes that he recruited in his metatheoretical endeavoring. He argued that metatheoretical constructs, which organize and regulate whole discourses and theories, were a necessary outgrowth of epistemological development. I pointed out that he began his forays into metatheory after executing a massive project that got him intimately acquainted with the full range of knowledge production processes then extant. So Baldwin's story teaches that the emergence of metatheory involves an *ability* to reflect on a range of knowledge production processes and recognize that they need regulating, organizing, and direction setting. This ability was inimitably exemplified by Charles S. Peirce, who faced the same unprecedented academic environment as Baldwin, and who also took the metatheoretical high road.

Peirce's Metatheoretical *Modus Operandi*

> The word *normative* was invented by the school of Schleiermacher. . . . But we must trace its introduction into common speech, to Wundt. It is taken from the Latin verb *normo*, to square. . . . The majority of writers who make use of it tell us that there are three normative sciences, logic, aesthetics, and ethics. The doctrines of the true, the beautiful, and the good, a triad of ideals which has been recognized since antiquity. . . . Logic is the theory of *right* reasoning, of what reasoning ought to be, not of what it is. On that account, it used to be called a *directive* science, but of late years the adjective *normative* has been generally substituted. (Charles S. Peirce, 1931, p. 5)

Peirce was a towering but controversial figure on the intellectual scene of his day. He was by any measure a prodigious polymath, with a working mastery of well over a dozen sciences, a mathematician, logician, metaphysician, and an epistemologist. He was one of the few American academics on the world stage during the middle of the 19th century, and was the first American to be elected as a member of an international scientific organization. But he was never able to gain the institutional support and positioning in the American academy that many thought he deserved. Both his personality and the substance of his intellectual contributions made it difficult for him to secure a position. As would be the case for Baldwin two decades later, a scandal forced Peirce to leave John Hopkins University.[6] And like Baldwin, Peirce was a metatheorist during a time when it was unacceptable to be one. During the last decade of his life he faded into obscurity, eventually dying in poverty in rural Pennsylvania. He was known as the greatest genius of his generation to a few (including William James and Theodore Roosevelt), but completely unknown to most.[7]

---

[6] A footnote is warranted about the fact that both Peirce and Baldwin were dismissed from the academy due to sexual scandals. (Baldwin was caught in a club that also served as a brothel; Peirce got a divorce and married a (very) young French woman). But a full discussion of the shadows of these men, the mores of Victorian America, and the complex and personal nature of the academic politics involved would take us too far afield (See: Brent, 1998; Richards, 1987).

[7] For an account of Peirce's life, which had the plot line of a Greek tragedy see: Brent, 1998.

Yet Peirce toiled away at his work, even as he was starving to death in the Delaware River Valley. He ultimately built what is one of the most profound philosophical systems ever constructed. As Peirce explained it,

> [I intend] to make a philosophy like that of Aristotle, that is to say, to outline a theory so comprehensive that, for a long time to come, the entire work of human reason, in philosophy of every school and kind, in mathematics, in psychology, in physical science, in history, in sociology, and in whatever other department there may be, shall appear as the filling up of its details. (Peirce, 2000, p. 168)

This system has exerted a wide ranging influence, from philosophers like Popper (1966) to linguists like Chomsky (1979), both of whom see Peirce as one of the most significant philosophers to have ever lived. His continued relevance for a wide range of fields outside philosophy, including semiotics (a field which he founded), cognitive science, and computer science, is evidenced by what amounts to an academic cottage industry, where scholarship is burgeoning (see Misak, 2004).

For the purposes of the story I am telling here, it is important to see that Peirce's work was, in part, like Baldwin's, a response to the unprecedented transformations affecting academic knowledge production processes in the later half of the 19th Century (Ketner & Kloesel, 1986). On one reading, Peirce's philosophical system can be understood as a general semiotics, analytically equipped for *overseeing, explicating, and evaluating* different kinds of beliefs at multiple levels—from propositions, to arguments, to discourses. Peirce executes this ambitious project by utilizing a variety of philosophical methods—methods Baldwin would claim exemplify the exercise of aesthetic imagination, or theoretical intuition.

Peirce surveyed a broad expanse of sciences and inductively explicated an evolutionary hierarchy akin to a biological taxonomy (Kent, 1987; Peirce, 1931). He built a system of existential-graphs wherein the relations between propositions are explicated via logically uniform concept maps (Peirce, 1933; Shin, 2002). He also clarified the intersubjective conditions for the possibility of reliable knowledge production, arguing that inquiry-oriented communication communities must have an open and inclusive structure predicated on trust, honesty, and reciprocity (Apel, 1995; Peirce, 1984). And of course, as a final example, it is well known that underlying his whole system was a set of three *primordial concepts*—in Kant's sense of being transcendentally basic—that he characterized as syncategorematic categories, and once correlated with the three basic pronouns, I, Thou, and IT (Habermas, 1992; Peirce, 1982). In all of these instances Peirce was out to build metatheoretical constructs that could play a role in adjudicative processes concerning the value of our cognitive wares.

Moreover, Peirce, like Baldwin, positioned his discourse-regulative project atop a broader evolutionary vision of the universe where the strivings of humanity are continuous with the evolution of the cosmos (Peirce, 2000; 1934; Esposito, 1980; Hausman, 1993). Peirce articulated a sophisticated and empirically grounded evolutionary ontology where all events are semiotic processes that co-evolve toward increasing complexity, autonomy, self-awareness, and possible harmony. Peirce's *pansemiotic* evolutionary theory was a unique (post-metaphysical) view in so far as it was explicitly offered as a hypothesis amenable to correction in light of forthcoming empirical data. It greatly influenced Whitehead (1978) and continues to intrigue and inspire scholars in the physical and biological sciences (Prigogine & Stengers, 1984) and philosophy (Apel, 1994).

This understanding of evolution allowed Peirce, like Baldwin, to bring his overarching normative concerns about the trajectory of academic discourses in line with a venerable philosophical tradition that articulated the radical significance of humanity’s cultural endeavors in terms of a cosmic evolutionary unfolding. Ultimately, Peirce, with a look in Kant’s direction, envisioned humanity as capable of multitudinous self-correcting intellectual and ethical endeavors, which ought to result in an ideal communication community coterminous with the cosmos. In this post-metaphysical eschatology, the ideals of *harmonious love between all beings* and *unconditional knowledge about all things* stand as goals to be approached asymptotically. With this thought Peirce rearticulates a philosophical motif that can be traced back through Emerson, Schelling, and Kant to the obscure cipher of Bohme’s mystical Protestant religiosity and its ancient Hebraic and Neo-Platonic roots.

What Does it Mean to Serve a Normative Function: Humanity's Task

> We are symbols, and inhabit symbols. . . . Our expressions, or namings, [or theories,] are not art, but a second nature, grown out of the first, as a leaf out of a tree. What we call nature, is a certain self-regulated motion, or change; and nature does not leave another to baptize her, but baptizes herself; and thus through the metamorphosis again. (from *The Poet* by Ralph Waldo Emerson, 1895, p. 86)

Emerson was not the first to speculate about the function of humanity in nature; but he was one of the most articulate. Beyond merely positioning humanity in the natural world, Emerson offered a vision in which humans have a role to play, a task ordained—a function—in nature. The continuity of human history with natural evolution would become a theme in American philosophy (Schnieder, 1963). Following the influential examples of Herbert Spencer and Auguste Comte, a set of speculative Americanized ‘cosmic histories’ were articulated by the likes of John Fiske (1874) and Francis Ellingwood Abbot (1885). Lester Frank Ward (1883), the St Louis Hegelians (Leidecker, 2007), John Dewey (1898) and others (Mead, 1936), would all argue that cultural evolution should be understood as being in important ways continuous with cosmic evolution. These early voices, like those of Peirce and Baldwin, toiled in Emerson's shadow. Of course, Emerson toiled in the shadow of Kant, who first tentatively and cryptically suggested that the laws humanity gives itself are best read as an autonomous extension of the self-regulative processes of the natural world. According to this view, humanity's *autonomy*—literally, its self-legislating capability—represents nature's crowning innovation, wherein are found startling advances toward novelty and complexity. Importantly, a capacity for autonomy entails the acceptance of responsibility. This is the root of the notion that humanity is somehow accountable for the trajectory of evolution.

According to the tradition I am reconstructing here—from Kant through Emerson to Baldwin, Peirce, and Wilber—the function of humanity in nature is a *normative* one. It is a function contingent upon the autonomy of humanity in an evolving world and humanity's reflective knowledge of this situation. This tradition suggests that we are responsible for directing the trajectory of evolution, and we know it (our ought to). Peirce wrote about it in terms of our having a responsibility to lay down new cosmic habits; Emerson offered his evocative and ennobling calls for self-determination with this broad context in mind; Kant argued that humanity ought to facilitate the transformation of the *kingdom of nature* into the *kingdom of ends* by proceeding such that the norms of our actions might be fit to serve as universal laws (akin to natural laws). These views highlight the directive, regulative, trajectory setting—that is, the *normative*—function of humanity in nature.

As I have suggested above, this philosophical tradition focusing on the normative function of humanity is the context from which the first metatheoretical endeavors emerged. Metatheories emerge, as Baldwin suggests and Peirce's work exemplifies, in order to regulate and oversee whole sets of discourses—serving a normative function vis-à-vis more local, discipline-specific theories and concepts. Metatheories set the trajectory for broad segments of culture and knowledge production. This saddles the metatheorist with unique responsibilities.

Along these lines, many of Kant's arguments were set in the context of specific views about the responsibilities of philosophers in the public sphere and beyond. In the final sections of the *Critique of Pure Reason,* Kant (1998, B867) lays out a distinction between two general types of philosophers: scholastic-reductionist and cosmopolitan-comprehensivist. The former perpetuates the fragmentation of knowledge by exercising the power of philosophy in isolated contexts and for partial purposes. The latter embodies a post-metaphysical vision of philosophy wherein the philosopher serves a normative function in the public sphere, explicating the *teleologia rationis humanae*, being a legislator of reason's future, and an immanent catalyst of the *corpus mysticum*.

Kant (1983) articulated one of the earliest and most influential normative global meta-narratives in a series of publications about the history of human civilization and the necessary future emergence of a global governance system.[8] In its wake Habermas and Apel have both articulated normative global metatheories concerned with the trajectory of cultural evolution—both trace a linage to Kant via Marx, Weber, the American Pragmatists, and other 19th century European thought-leaders. It seems Wilber can trace a linage to Kant via Baldwin, Peirce, and Emerson, all cosmopolitan agents building metatheories to fit normative functions. With this backward glance we are positioned to consider the shape of metatheories to come.

Conclusion: The Shape of Metatheories to Come

> [Post-modern capitalistic social structures] have evidently found some functional equivalent for ideology formation. In place of the positive task of meeting certain needs for self-interpretation by ideological means, we have the negative task of preventing holistic self-interpretations from coming into existence. . . . *Everyday consciousness* is robbed of its power to synthesize; it becomes *fragmented*. . . . The attempts at an *Aufhebung* of

---

For Kant's life and the political complexities and editorial compromises surrounding his radical views see: Cassirer, 1981. And for the contemporary relevance of Kant's cosmopolitan political vision: see Habermas, 2006. Finally, for Kant's views on *normativity*, a concept central to his whole philosophy, see: Brandom, 2009; Korsgaard, 1996)

> philosophy and art were rebellions against structures that subordinated everyday consciousness to the standards of exclusive expert cultures developing according to their own logics . . . Everyday consciousness sees itself thrown back on traditions whose claims to validity have already been suspended; where it does escape the spell of traditionalism, it is hopelessly splintered. In place of “false consciousness” we today have a “fragmented consciousness” that blocks enlightenment. (Jürgen Habermas, 1987, p.355)

At the outset I raised the possibility of a species-wide identity crisis that would render humanity incomprehensible to itself. This is one way of recasting the idea—handed down from Dewey, through Habermas, to Wilber—that non-synchronic patterns in socio-cultural development have resulted in a situation where our techno-scientific capabilities far outstrip our ethico-political visions and organizations. Just as unprecedented scientific advances expand the reach and efficacy of our communication and biomedical technologies, the fields tasked with expressing an understanding of what humanity is have been rendered speechless by their own confusions. The proliferation of self-descriptions provided by contemporary biologically oriented human sciences offer a fragmented and reductionistic picture, while the humanities and social sciences, underfunded and undervalued, pursue opportunistic and conservative research agendas (Kagan, 2009). In the same historical moment we find ourselves with the knowledge and power to reliably and strategically affect the central nervous system as a means for canalizing behavioral conformity, our *normative discourses* are in disarray—the normative sciences, as Peirce would call them—these are the discourses that address how things *ought* to be with society and its discursive institutions. In the coming decades, as the global information explosion continues and networks of communicational connectivity encircle the earth, we will be using them to debate the meaning of our humanity—striving to articulate a set of global values that might allow us to understand ourselves as the inhabitants of a globalized techno-economic and communications infrastructure. The academy—the so-called ‘multiversity’—is not built to provide humanity with a coherent picture of itself. The desperate trumpeting of interdisciplinary approaches in colleges and research labs is a testament to this (Menand, 2010).

In a set of publications I have addressed issues of quality control at the level of interdisciplinary knowledge production and education, and suggested that metatheoretical constructs play a necessary role in epistemologically responsible approaches to interdisciplinarity (Stein, 2007; Stein, Connell, & Gardner, 2008). Specifically, I suggested that metatheoretical constructs, such as the four quadrants (Wilber, 1995), the ideal speech situation (Habermas, 1998), and the classic syncategorematic categories (Peirce, 1984), play an important function in both disciplinary and interdisciplinary discourse. This function can be characterized variously, as the setting of quality control parameters, or the clarification of our epistemic and ethical responsibilities. Metatheoretical constructs can be built to *oversee,* regulate, and direct disciplinary and interdisciplinary knowledge production. Metatheory, as I see it, serves an important normative function on the contemporary academic scene.

But the contemporary relevance of transforming knowledge production processes goes beyond the academy. Problem-focused interdisciplinary think tanks are beginning to play an increasingly important role in an emerging global network of change-oriented institutions. While some—such as the Club of Rome and branches of the Organisation for Economic Co-operation and Development (OECD)—have been around since the 1970s, the past decade has seen a proliferation of action-oriented institutes that span traditional disciplinary boundaries for the sake of producing usable-knowledge about pressing global problems. The State of the World Forum, Integral Institute/Research Center, and the Future of Humanity Institute at Oxford, are three examples out of literally dozens. The United States Federal Government and the United Nations continually create specific problem-focused interdisciplinary initiatives, and readily draw from those already producing usable-knowledge in the public sphere. Above I have expressed what I think the role of metatheory is in this constellation of conditions, in the academy and beyond. It is to weave a coherent overarching set of normative constructs, organizing and regulating the specialized discourses in view, with an eye to comprehensiveness, and a voice resonant with the lifeworld.

As mentioned in the first footnote, this view of metatheory is controversial. But the idea here is not to displace or replace the self-understanding of metatheorists who take themselves as scientists pursuing descriptive projects with objective methods. Rather, the intention is to remind big-picture thinkers that this kind of scientific self-understanding is not the only option. Putting arguments about the crypto-normativism of ostensibly descriptive projects aside (Habermas, 1987), I claim only that we metatheorists might want to think differently about what we do. I sketched the contours of a tradition that weds the normative function of metatheory to ideas about the *autonomy* and *self-directedness* of human cultural evolution. I suggested that metatheorists are those concerned about the trajectory of knowledge production processes and reflective cultural practices. According to this view metatheorists build specific kinds of high-level constructs that have a normative thrust. Their interventions aim at affecting the proprieties of our discursive practices.

Hand wringing about the liabilities accompanying these kinds of explicitly normative projects is to be expected. While performative contradictions plague arguments against normative endeavors—prescribing the wholesale rejection of prescriptions—there are legitimate worries worth attending to. Worries about the institutionalization of centralized discursive authorities are warranted, as are concerns about the nefarious political affordances of *evolutionary ideologies* (Farber, 1998). Yet these are not necessary accoutrements to the vision of metatheory outlined above.

The key players in my account, including Kant, Peirce, and Habermas, are stanch, articulate, and influential proponents of the free and open discursive practices that characterize the best scientific communities and democratic public spheres. Against the backdrop these thinkers provide, the criticism that normative metatheoretical endeavors would be coercive enterprises, aimed at stifling discourse, innovation, and free inquiry is misguided. The idea that metatheorists *oversee* and *regulate* various discursive practices does not entail that metatheorists are *overseers*. Rather they are just the most reflective and visionary *participants* in knowledge production processes, arguing about preferable or regrettable trajectories for sets of disciplines, suggesting syntheses, but wielding nothing other than the unforced force of the better argument. I support the institutionalization of metatheoretically guided knowledge production because the exercise of normative authority in these contexts is *not* merely a matter of power-broking. Sweeping arguments to the contrary betray a lack of nuance about what normative authority looks like and reflect the sorry state of our normative discourses more generally.

As the quote beginning this concluding section suggests, we inhabitants of the post-industrial West share a lifeworld characterized by the devaluation of overarching and totalizing ideologies (see also Bell, 2000). And we still associate the very idea of normative authority with the dark legacy of politically operationalized all-encompassing worldviews. The story told above about the fractioning (and factioning) of the modern research university is but one sub-plot in a larger narrative about recent transformations in the self-understanding of the species. No doubt, the specter of an evolutionary ideology has loomed at least since Darwin first articulated an objective mechanism governing evolutionary processes. But the slow and persistent emergence of an evolutionary worldview has not counteracted broader tendencies toward a radically polycentric and conflict-ridden cultural environment. Even putting aside its rejection by traditionalists preferring non-scientific accounts, evolution is an ambiguous and contested concept, especially with regards to its broader ethico-political implications (Wilber, 1995; Wilson, 1975). The suggestions I offered here assume that heterogeneity and pluralism will continue to characterize cultural evolution. Exercising the normative function of metatheory does not entail the homogenization of cultural practices and discursive institutions in the name of evolutionary progress. Placing metatheory in an evolutionary context does not entail taking on the worst baggage from over a Century’s worth of attempts at resuscitating ideology in evolutionary garb (Farber, 1998).

Shadow boxing aside, the goal of this paper has been to *remember* and *express*—to reconstruct a thread in the history of metatheory with the hope of affecting the shape of metatheories to come. More work remains to be done filling out the rest of this history, and more importantly, building metatheories that fit the specifications thus reconstructed. I have already begun this constructive metatheoretical work in a series of publications that address the use of *metrics* in contexts where human lives are under scrutiny, from the diagnostic categories that structure the delivery of psychopharmacological interventions to the standardized testing infrastructures that frame educational opportunity (Stein, Dawson, & Fischer, in press; Stein, della Chiesa, Hinton, & Fischer, in press; Stein & Hiekkinen, 2009). Overseeing complex multi-disciplinary areas of concern, these interventions involve the construction of metatheoretical constructs that serve as normative parameters. I argue the merits of setting a new trajectory for the various discursive practices involved with the institutionalized measurement of human functioning, suggesting directions more comprehensive, responsible, and responsive to the singularity and vulnerability of individuals. Moreover, as others have shown (Jaques, 1976; Nussbaum, 2006; Sen, 1999), the possibilities of cultural evolution and justice in the coming decades hinge on the kinds of *metrics* we choose to build and use when assessing the properties of human lives that bear on political and economic decision making. Our systems of measurement determine who we think we are and what we do to each other. Consider how SAT scores and GDP reports affect the self-perceptions of individuals and nations respectively, how partial they are as indices, and how drastically they alter the distribution of resources. But these considerations bring us full circle, back to the idea that we are responsible for the creation of the metatheoretical languages we would use to re-describe and re-create ourselves.

Metatheories and Organizational Theory: A Pragmatic Response to Metatheoretical Uncertainty

Stratos E. Ramoglou[1]

Abstract: Metatheoretical dilemmas about the nature of the social world often animate organizational theorists who purport to dissolve pertinent controversies along truth-laden lines of philosophical argumentation. The present paper acknowledges the inescapable uncertainty at this level of discourse to nonetheless resist taking the usual step according to which metatheoretical discourse should be abandoned as unhelpful, if not misleading, metaphysics. However, it also parts from traditional modes of metatheoretical defense to instead try to identify whether metatheoretical frameworks, beyond considerations of any possible cognitive merit in deciphering the nature of the world, may be of any use in making a desirable difference in the world. In developing a pragmatist defense of realist metatheories, we may explicitly value metatheoretical discourse from a novel standpoint and further delineate subtle conceptual relations between metatheory, theory, phenomenological acceptance, action and epistemic ethics.

Keywords: belief/epistemic ethics, metatheory, organizational theory, post-analytic philosophy, organizational unconscious, social epistemology.

> What we cannot speak about we must pass over in silence.
> *L. Wittgenstein*

> A great deal of bad philosophy comes from people thinking that they can somehow whistle what they cannot [speak about].
> *A. J. Ayer*

> For Wittgenstein, it was absolutely vital to realize that Freud had not given us a set of scientific explanations for, e.g., dreams and neuroses. His achievement was much greater than that, for what Freud had given us, according to Wittgenstein, was a new mythology, a new way of looking at ourselves and the people around us.
> *R. Monk*

Introduction

Metatheoretical issues traditionally provoke significant controversies among social theorists. Among the disputes of a metatheoretical nature, the soundness of realist systems of thought

---

[1] **Stratos Ramoglou** is a doctoral candidate at the University of Cambridge. His principal research interests fall in three broad categories: (the theory of) entrepreneurial action, philosophical logic, and issues in social epistemology and ontology. Although his doctoral dissertation is occupied principally by the first topic, the present article is part of a project consisting of papers that investigate issues regarding knowledge claims on various levels of discourse in light of ethical and ontological considerations.

undoubtedly occupies a prominent position. For while there is an increasing interest in the ontological questions that have been traditionally tabooed by (empiricist) philosophers of science, anti-metaphysical skepticism has by no means vanished. A salient factor responsible for this state of affairs should be reasonably attributed to the prominence of constructionist metatheoretical (anti-realist hereafter) approaches, since it seems that they have at their disposal powerful conceptual tools for undermining the soundness of claims that promise to provide access to or presuppose knowledge of essential truths about the nature of the world.[2, 3]

Among social theorists engaged in ontologically-informed metatheoretical disputes, organizational theorists, and especially scholars in the Critical Management Studies (CMS) sub-domain of organizational theory, are remarkably active (see for example Contu and Willmott, 2005; Fairclough 2005; Fleetwood 2005; Grey and Willmott, 2005; Reed 2005). Positioning himself radically in pertinent debates, almost a decade ago, Tsoukas reminded organizational scholars that thinkers such as Wittgenstein have taught us “not only what questions to ask but, more crucially, what questions we should *not* ask” to suggest that the question “whether one should take a realist or a constructionist approach to explaining organizational phenomena . . . is an unhelpful question” (Tsoukas, 2000, p. 531). On this (meta)metatheoretical positioning, he advises that we transcend the false metaphysical dilemmas underpinning pertinent metatheoretical disputes and head toward pragmatism.

To unpack the mode of skepticism imbuing Tsoukas’ position, when one argues for a realist or constructionist metatheory, one tries to speak what one “must pass over in silence” (Wittgenstein, 1961/1922, §7), since one vainly struggles to answer unanswerable questions. These are metaphysical questions which are, by their very nature, unsusceptible to objective settlement by logico-empirical means. Along this line, it follows that, if we succumb to the temptation to answer them, we are doomed to produce idling discourse, but not answers. Or, as Ayer (echoing Frank P. Ramsey) would put it, realists and constructionists try to whistle what cannot be (meaningfully) spoken, and in doing so produce “bad philosophy” (Ayer, 1956, p. 75).

Notably, the type of anti-metaphysical skepticism displayed by Tsoukas applies at the level of *meta*theory and as such should be acknowledged as skepticism of a higher order than that applied

---

[2] Note that it would verge on the boundaries of a naive simplification to presume the presence of major intellectual consensus between realist or anti-realist strands of thought. Moreover, one should keep in mind that these concepts have undergone extensive conceptual stretching by being used in a multitude of contexts and for a variety of purposes (see also Hacking, 1999). However, if it would be prudent to avoid identifying the common attributes of strands of thought fashioned as “realist” or “anti-realist,” we may at least try to identify what is most typically the locus of divergence. To this end, there does not seem to be a safer way of distinguishing between realist and anti-realist metatheories with respect to the divergent stances that they tend to take pertaining to the question of whether conceptions that transcend experience should be treated as having extra-discursive reference or not. For while the realist is inclined to respond favourably to relevant metaphysical questions, the anti-realist tends to treat pertinent conceptions as having no extra-linguistic or mind-independent counterpart but as the mere outcome of the ways that we (communally or not) structure/construct experience.

[3] Of course, anti-realist positions are not as ontologically neutral as they pretend to be (see Searle, 1995, pp. 149-197). However, although negative metaphysical assertions are inevitably ontologically-charged, it certainly helps to differentiate them from realist metatheories by identifying the latter with approaches that take a positive stance on existential questions.

at the level of theories, namely, the level of discourse typically favored by anti-metaphysical skeptics. Consider, most obviously, God-centred discourse: just as one cannot affirm the existence of God, it goes, neither may one claim that “God does *not* exist” (Ayer, 2001, p. 121). It should thus merit noting that, if theories of this sort are from this analytical viewpoint condemned as unanswerable metaphysical questions, Tsoukas should be plausibly understood to be framing *meta*theories as unanswerable metaphysical *meta*questions. Or, as (the later) Wittgenstein could put it (utilizing early Wittgenstein’s semantic vocabulary) they are *higher-order non*sense.

The present paper does not dispute the above thesis and on *methodological grounds* concedes to this type of skepticism. This is to say that the espousal of this mode of skepticism does not stem from the expression of a genuine cognitive stance, that is, the belief that respective metatheoretical positions have equal cognitive merit. Instead, the motivation for doing so is that this maneuver may allow us to surpass the conventional epistemic criteria for assessing pertinent disputes and examine whether we may settle them along non-traditional lines of thought. In other words, having espoused the ontological agnosticism propounded by Tsoukas, what is presently put under critical scrutiny is whether the advice of (metatheoretical) silence follows of necessity or whether there may be reasonable *non*-epistemic *grounds* for maintaining/advancing (metatheoretical) discourse.

To put it simply, the motivation of the present paper is to examine whether metatheoretical frameworks may be helpful in some way, *even if* we accepted that they serve no epistemic purpose. To respond to the aforementioned aphorisms, I inquire whether metatheories may be useful as “working whistles,” for whistling what cannot be confidently uttered, once we embrace metaphysical uncertainty. To position myself with respect to Tsoukas’ anti-metaphysical pragmatism, I purport to examine whether embracing his anti-metaphysical stance in favor of a pragmatist orientation is consistent with metatheoretical discourse. I argue that it is, and will venture to defend this thesis by advancing a positive evaluation of realist metatheories beyond standards of *epistemic validity* and along criteria of *pragmatic legitimacy*.

The challenge of securing an *extra*-epistemic defense of metatheories may be feasibly undertaken once we appreciate their *deeply practical* function. This concerns the fact that in their implicit promise that they provide “true windows” onto the world, realist metatheories *can* be utilized as validating frameworks for claims that could have otherwise been highly epistemologically vulnerable. For one basic function of (realist) metatheories is to shield scholarly claims from the (so common) “How do you know?” epistemological question[4]. Again, consider the concept of “God.” While the claim that “God exists” is unquestionably untrue within a constructionist framework, it is not so untrue along a realist one. For instance, it is not trivial that Archer, Collier, and Porpora (2004) foundationally ground their defense of the scholarly merit of God-centred discourse in the soundness of a realist metatheory.

Notably, if in this case realist *meta*theory is tantamount to a “whistle,” it is the concept of God that is the *theory* being whistled. Along this conceptual geography, it seems that the success of the goal of achieving a pragmatic defense of the desirability of realist metatheories fundamentally relies on the convincing defense of the presence of a theory that *merits* whistling. Thus, while Archer and colleagues appear to defend the utility of God-centred discourse, having previously accepted the truth of a metatheoretical standpoint, this paper would fulfill its motivation by going the other way around. More specifically, by examining whether we ought to commit to the realist metatheory having previously examined the *desirability* of discourse on God.

---

[4] Essentially by questioning the cherished view that “certainty” is a necessary component for the proper understanding of “knowledge.”

Evidently, one way of fulfilling this paper's task would be through the pragmatic defense of the concept of God. In my failure to present a convincing case regarding the pragmatic legitimacy of the notion of God, however, I examine the pragmatic legitimacy of another concept whose ontological status is also questionable, viz., the Freudian unconscious, in the light of the *emancipatory* axiology, which, after all, is supposed to foundationally inform the CMS project.

The backbone of the rationale is rather uncomplicated: Having first opined positively on the desirability of (the effects likely to be produced by) the belief in the unconscious, we may subsequently discern the pragmatic usefulness of metatheories in sustaining (conceptions of) its cognitive merit. Finally, it merits noting from the outset that, in the effort to bestow a pragmatist orientation on this enterprise, I utilize basic intellectual blocks of Steve Fuller's (1987; 2002) social epistemology.

The paper is structured in three sections. The first section closely assesses the inadequacy of a realist vis-à-vis a constructionist metatheory to answer the question of the unconscious in an epistemologically conclusive way. The second section, develops a heuristic exercise aiming to examine the desirability of the effects for organizational life if belief in the existence of the unconscious were adopted or rejected and underscores the pragmatic centrality of realist metatheories. In the final discussion section, I anticipate criticisms that the developed line of argumentation inevitably raises.

Embracing Metaphysical Uncertainty

Does the Unconscious Exist?

According to the Freudian worldview, the unconscious lies at the very centre of psychoanalysis" (Gabriel, 1999, p. 5), and the whole psychoanalytical discourse thereby is significantly predicated on the existence of the unconscious. The unconscious is like the warehouse of our psyche, where threatening desires and ideas are stored yet not erased. Those repressed elements are like another self who covertly occupies an agentic space of our psychic being. This hidden agency is, as Gabriel puts it, akin to "a stranger within ourselves . . . [who] has unpredictable, destructive and self-destructive appetites" (Gabriel, 1999, p. 311).

In spite of appealing to unobservable "stuff," for Freud, the unconscious was not only *real* but additionally "subject to normal scientific scrutiny" (Gabriel, 1999, p. 6). However, although Freud argued for its scientific status, it does not seem that he succeeded in convincing fellow scientists. Thus, we find Freud complaining that, "The concept of the unconscious has long been knocking at the gates of psychology and asking to be let in. Philosophy and literature have often toyed with it, but science could find no use for it" (1940, p. 286).

The idea of the unconscious has indeed been received with heightened levels of skepticism by the scientific community. This stance is largely explicable if we consider the temper of the era, which was significantly influenced by the epistemology of the empiricist philosophers of science; an epistemology significantly underpinned by hostility towards evidentially unconfirmable propositions. The most famous attack against the scientific validity of psychoanalysis has arguably been carried out by Karl Popper (1963). In a word, from the Popperian point of view, the ideas put forward by Freud are unfalsifiable, and thus pseudoscientific, and should therefore be excluded from the corpus of beliefs that we value as knowledge. Notably, whereas Freud adopts a realist attitude, the Popperian is skeptical. However, it is not epistemologists of science that most strongly reject the validity of Freud's propositions. Far from that, it is the *constructionist* doctrine that more foundationally threatens the validity of psychoanalytical ideas.

This point merits closer attention. Popper did not dogmatically preclude the possibility of some metaphysical assertions being useful, true or falsifiable by upcoming hypothesis-testing technologies or observational possibilities. It may thus be said that Popper was *not* an ontological antirealist, but rather a *methodological* antirealist. Empiricist epistemologists, more generally, were concerned with the justificatory (and/or semantic) status of propositions and did not reject the possibility that Freud may have indeed discovered something uniquely real. They merely underscored that certain discursive practices are not science and *ought to* be *demarcated* from scientific discourse.

On the contrary, constructionists tend to deny the very possibility of Freudian introspection or superior insight as a plausible source of knowledge. Significantly, the constructionist sociologists of knowledge, Berger and Luckmann, have prompted social scientists to face psychoanalytical theories "as legitimations of a very peculiar and probably highly significant construction of reality in modern society" (1966, p. 210); while, Kuhn, the constructionist philosopher of scientific knowledge has argued that psychoanalysis is no more than a craft, likening it to astrology (Kuhn, 1970, p. 8). From a constructionist standpoint, the totality of being is thereby reducible to social constructions, and theories that draw their credentials from suppositions of human nature should be treated as misguided and/or misleading fictions.

Thus, if empiricist theorists of knowledge confront metaphysics by denying its *epistemological* plausibility, constructionists deny the very ontological *possibility* of extra-discursive reality. Constructionist epistemology should thus be acknowledged as radically different from empiricist epistemology. To recap, concerning the ontological status of the unconscious, Freud claims to know that it exists, the (consistent) constructionist that (s/he knows that) it does not exist, and the empiricist epistemologist remains silent.

Who Knows?

Consider that although a constructionist rejects the psychoanalytical worldview as metaphysics, the constructionist worldview is no less metaphysical. Constructionism may appear *prima facie* as an epistemological thesis, but it is at its core a particularly ontologically bold metatheory, since constructionists (tacitly) hold fairly strong presuppositions pertaining to the nature of the world. Likewise, whereas realism *prima facie* presents itself as an ontological thesis, it is also an epistemologically bold metatheory, since the existential plausibility, for instance, of the unconscious presupposes Freud's advanced epistemic capacities regarding the discernment of a possible existence.

This paper acknowledges the merits of the view advanced by Tsoukas, namely, that such questions cannot be addressed objectively, by accepting that the question of the appropriateness of any metatheoretical standpoint cannot itself be settled on certain foundations. Differently put, both frameworks provide epistemic justification to statements that postulate knowledge status, although they are themselves epistemologically fragile. We may thus acknowledge that employing a realist or a constructionist metatheory is *to some extent* an *inevitably* arbitrary choice. It follows that, if no such choice can take place on a metatheoretically *impartial* basis, we may accept that we are in a state of metatheoretical *agnoia*.

However, even if "the metaphysical bedrock upon which the [realism/constructionism] dichotomy rests . . . leads nowhere and is philosophically flawed" (Tsoukas, 2000, pp. 532-534), it seems that we still have to take a stance about the existential standing of the notion of the unconscious that is so central to psychoanalytical discourse. For the least of reasons, an agnostic stance would not be very different *in practice* from the banishment of the unconscious from discourse that we academically acknowledge/treat as reliable.

A plausible path for moving ahead may be discernable if we search for an extra-epistemic standpoint in order to respond to a metaphysical question that may not be resolvable on metatheoretical grounds. And in the case of CMS such a point of reference need not be arbitrarily imposed. That is because, as we are going to see, such a vantage point may be easily identified in the emancipatory axiology informing the very essence of the CMS project.

Toward a Pragmatist Solution

Having espoused an ontologically agnostic stance on the level of metatheory, I presently draw from Fullerian epistemology aiming to find a pragmatic way out. In particular, I will venture to develop a heuristic exercise that explores the desirability of the effects that certain phenomenological attitudes pertaining to the reality of the unconscious are likely to beget in the workplace. On those grounds, we may then have some pragmatic basis for justifying the legitimacy of competing stances pertaining to the metaphysical dilemma of the unconscious, to *then* turn back to the *meta*dilemma of metatheories and approach it with a pragmatically solidly-justified position.

From the Quest for True Knowledge to the Question of Belief Ethics

The employment of basic conceptual tools of Fuller's social epistemology offers a way of reaching a pragmatic response. In Fuller's words, "the answers to these questions are to be found by deciding what we want, a political issue centering on the definition of 'we' and evaluating the consequences of those practices accordingly" (2002, p. xvi). It follows that if we want to answer the question of the unconscious in line with the Fullerian social epistemology, we have to examine the degree of convergence of the effects of the relevant existential claim (i.e., the unconscious *is* real), inferred causal accounts (e.g., *if* desires are repressed, *then* neurotic behaviors arise), and explanatory inferences (e.g., employees are underachieving *because* their psychostructural needs are neglected) with proclaimed interests.

Transcending concerns of epistemic validity, we now ought to first think about "who we are" and "what we want," and then examine whether we may thus answer the otherwise unanswerable question of the existence of the unconscious. Notably, not all organizational scholars share identical scholarly interests. For example, some are concerned with enhancing the levels of organizational performance, while others are motivated by humanist ideals. If there can hardly be consensus on the interests by all pertinent agents, the answer to this question should be contingent upon the interests of certain disciplines as realized by their underlying values. In this spirit, we examine the relevance of the effects ensuing from dis/believing in the unconscious for *emancipatory* interests. After all, as we may see, they are already *presupposed* in the context of Critical Management Studies, which is also the scholarly context in which metatheoretical disputes on the nature of organizational phenomena typically unfold.

Who Are "We"?

On closer consideration, the domain of CMS provides fairly unambiguous responses to ethics-related concerns. Alvesson and Willmott describe the CMS manifesto, noting that it is an extension of Critical Theory that:

> should contribute to the liberation of people from unnecessarily restrictive traditions, ideologies, assumptions, power relations, identity formations and so forth, that inhibit or distort opportunities for autonomy, clarification of genuine needs and wants, and thus greater and lasting satisfaction. (Alvesson and Willmott, 1992, p. 435)

Manifestly, the CMS project is normatively informed by emancipatory ideals. Thus, it provides a relatively clear-cut answer to the question of *how* the *desirability* of respective concepts whose ontological status is under scrutiny *ought to* be evaluated: with respect to the "emancipatory effects" that respective knowledge claims are anticipated to beget.

Given our interest in emancipation, the desirability of the unconscious may now be evaluated by examining whether there may be good reasons to believe that its acceptance may serve in the fulfillment of emancipatory ideals. In this vein, in the following subsections I deploy a phenomenological type of analysis, in order to reflect what it would mean *practically* to accept or reject the concept of the unconscious.

Accepting the Unconscious

If the unconscious is "a part of our mind that is beyond our direct knowledge and control" (Gabriel, 1999, p. 311), then, I suggest that, the phenomenological acceptance of the unconscious on behalf of a manager would mean that one has to accept the futility of trying to gain total control over the organization. For the acceptance of the reality of something entails accepting that it cannot just be "wished away." At the same time, being unknowable entails that one should not expect that someday we may understand how we may "tame" it. It may thus be plausibly argued that if managers believe in the existence of the unconscious, doubting their ability to control organizational behavior effectively is likely to water down the epistemic hubris of being able to control the workings of organizational life masterfully. It could be said that committing ontologically to the existence of the Freudian unconscious is tantamount to accepting that I cannot afford to avoid the presence of an annoying housemate.

From this standpoint, it may be plausibly argued that trust in the functional efficiency of rationalizing practices is likely to be undermined and the workforce to be emancipated from the tightening of control. From this viewpoint, espousing the "reality"/reality of the unconscious, managers are *less* likely to *act* in anti-emancipatory ways that the belief in their ability at managing the *unmanageable* buttresses (Gabriel, 1995).

The unconscious may be thus seen as a "working narrative" for appreciating the chaotic aspects of an otherwise highly-orderly, experienced organizational reality. Differently put, the idea of the unconscious appears as a working means for lending phenomenological substance to our encounters with the organization as a "*chaosmos*" (Tsoukas, 2003, p. 618), and this complex worldview could help us produce desirable emancipatory effects by helping managers experience idiosyncratic behaviors as ineliminable, in effect, making the managers less likely to stigmatize these idiosyncrasies as unnatural, an attitude that the belief that they could counterfactually be tamed would plausibly encourage.

Denying the Unconscious

In contrast, the denial of the existence of an "unearthly" agency capable of "naturalizing" the erratic behavior of employees, by framing it as inevitable, would mean the espousal of an alternative explanatory schema that would frame pertinent behaviour as controllable. This is the understanding that emerges along a constructionist worldview that confronts reality as the constellation of contingent events. For the ensuing attitude is that experiences do not conform to some fundamental necessity, but are presumably *non*-inevitable. (see Hacking, 1999, p. 6)

Imagine that I have just experienced an unfriendly attitude by the waitress who served me. If I am equipped with a "constructionist worldview," I am less likely to excuse her, since my background presuppositions provide validating credentials for the inference that she *could have* behaved in a more "civilized" manner. Locked in a constructionist mindset, I feel convinced that she simply failed in being a well-mannered employee, and consequently I feel annoyed by her behavior. Moreover, I dare to guess that if I were occupying an administrative position in the cafeteria, I would seriously consider the actions that should be taken for this relevant misconduct to be "remedied."

What could the implications of such an imagery of organizations be when espoused by the actual controllers of organizations? If managers see organizations through these sensemaking lenses, they are likely to try to eliminate the "irrational" aspects of the organization that are perceived as threatening for the smooth functioning operation of an organization. Gabriel has argued that "Being in charge is a core belief of managers, no matter how much unpredictable reality frustrates them" (1999, p. 283). The absence of doubt regarding one's unfailing ability to intervene in the workings of the organization that the rejection of the unconscious could reasonably encourage is likely to heighten the levels of managerial epistemic hubris. Whereas I previously believed that the waitress *could* have controlled her reactions, the manager is equally likely to believe that s/he *can* control erratic aspects of organizational life that *need not* have been such.

The Pragmatic Centrality of Realist Metatheories

Beyond the fact that the background absence of a realist framework would have a priori framed as implausible psychoanalytical (organizational) discourse, we may briefly elaborate a further function of realist metatheories. Up to now, it was argued that though we *do not* know if in fact the unconscious exists, we *need not* know this truth in order to whistle it as true. Nonetheless, how *credible* may an "academic whistling" sound? From an epistemology of testimony standpoint, testifying that the unconscious is probably true or that it is legitimate to be believed as true would be skeptically received.[5] And if we further desire to have a practical impact on organizational life, appeal to realist metatheories should plausibly help in acquiring the required epistemic weight. In our case, they could offer good philosophical grounds for postulating the soundness of organizational theory that presupposes the existence of the unconscious.

Moreover, let me draw your attention to the suitability of the *critical* realist metatheory for legitimating the "truth"/truth of entities of low evidential status. Although the evidential standing of the unconscious when juxtaposed with that of tables makes the former an "easy prey" for the epistemologist, critical realism could shield the valuable idea of the unconscious from epistemological scepticism. The elaboration even of the elementary lines of this metatheoretical project is not possible in the present paper (see Bhaskar, 2010 for an informative statement). However, let me only highlight that by appealing to notions such as the multilayered stratification of social reality or the structure of the human agent, organizational scholars can certainly protect pragmatically legitimate notions that a disinterested quest for certainty cannot allow.

Of course, this is not to here naively assume that realist metatheories are never employed in order to satisfy practical ends. For example, Thompson's defense of critical realism betrays a pragmatist motivation, when he stresses critical realism's suitability for resuscitating "the possibility of making truth claims" (2004, p. 60), which he argues that postmodern approaches do not permit. However, even if this is so, it is not clear *when* metatheories are used in this fashion, or when they actually *prospectively* determine the claims to be made.

Figures 1 and 2 sum up the rationale through a diagrammatic depiction. The whitened circle denotes that when equipped with a constructionist metatheory, a scholar is likely to deny the existence of the unconscious. Contrarily, a scholar committed to a realist metatheory is more likely to accept the truth of the unconscious (blackened circle). Having espoused the vanity of relying a priori on metatheories for solving similar questions, the lower cases of the diagram show how a pragmatist way of dealing with the puzzle of the unconscious may work. In a bit more detail, in the first scenario, *I* (an organizational theorist) believe that discourse that refutes the reality of the unconscious is likely to nourish attitudes that *I* trust are going to give rise to disciplinary actions and thus contribute towards the generation of undesirable effects in the organizational context. By contrast, *I* believe that discourse that maintains a different take on the unconscious is likely to contribute to enhancing the emancipatory potential in organizational life. I do not know what is truly happening or is going to happen, but I reckon myself pragmatically justified to accept and utter in my scholarly writings and teachings the unconscious *as* true and utilize realist frameworks in order to defend my (uncertain) claims from devastating skepticism.

Discussion

The robustness of the suggestions put forward significantly relies on the assumption that scholars of organization studies are not only students and educators but additionally *able* creators of organizational realities. A reasonable objection to this assumption concerns the ability component. This assumption may be further broken down into three reasonable objections: first, that organizational scholars *can create* aspects of the world; second, that even if they can, they are *ethically licensed* to do so; and third, that even if both the first and second objections are supported, scholars *can know* the effects that their actions will bring.

In response to the first objection, saying that scholars are capable creators of aspects of the organizational world is not tantamount to assuming that they can willingly fulfill their voluntarist fantasies. If, however, we accept basic sociological thinking on how the assumptions of reality tend to become self-fulfilled, we are justified in believing that the discourse that we produce and accept as reliable influences the constitution of aspects of reality when assimilated in social cognition. A complete denial of this sociological process is invited, but an alternative account capable of explaining how definitions of institutions of epistemic authority tend to be self-fulfilled is required.

With respect to the second objection, it may be argued that substituting epistemic for social values is "unethical." If we understand the compulsive trust in truth to be a guarantee of the march of progress, sacrificing epistemic values for the sake of social values is certainly unethical. Having, however, refused the possibility of attaining the truth with regard to metaphysical questions, our stance is significantly ethical, because at least we do not hide under pretences of truth. From this point of view, unethical scholarship is instead the generation of propositions that is apathetic concerning their effects.

On the last point, the response is that the assumption that we can *affect* the route of organizational becoming does not imply that we can *know* what is going to happen. Nevertheless, the beliefs we hold pertaining to the effects that certain propositions we sanction may beget range along a continuum of plausibility. And even if the very idea of rationality may be deceptive, one need not adopt a nihilistic view and relinquish the endeavour to be more thoughtful regarding the versatile nature of the world and its complicated workings. This is so, because, to the extent that we are able cognitive agents, denying the possibility of our judgmental faculties is a self-deceiving, if not self-defeating, attitude. Expressed in another way, to be in the dark is not to be blind.

Again, this is by no means to assert that through exercises such as the one developed here one can predict what will occur. Nonetheless, what is minimally suggested is that being more *reflective* on the social effects immanent in the epistemic warrant bequeathed to propounded worldviews can provide the basis for (at least) more morally responsible scholarship. We may not know what is so, but we can transcend the often responsibility-absorbing alibi of truth, to reflect more honestly on the desirability or potential danger of respective ideas.

Finally, note that not all organizational theorizing is laden with emancipatory values, and similar pragmatist exercises may be plausible, if the end-value is substituted. Nevertheless, ethical reflexivity is hardly ever irrelevant when dealing with organizational conduct. A point of import defended in this paper is that religious devotion to metatheories may not only delude us, but more importantly impede the scholar's critical capacities to engage *responsibly* with the world and its possible workings (see Fuller, 1993).

Conclusion

Following Tsoukas' framing of the realist vis-à-vis constructionist "epistemological rivalry . . . [as] philosophically flawed" (2000, p. 534), we purported to examine the dilemma facing respective metatheories against a pragmatist background. In order to explicate the futility of settling metaphysical questions on metatheoretical foundations, I employed the example of the Freudian unconscious to assert that there is not any epistemologically objective vantage point for knowing whether Freud had a revelatory experience or if he was simply deluding himself. Espousing an agnostic stance, I was subsequently guided by Fuller's epistemic ethics to explore the possibility of advancing the "ontic truth" of the unconscious on the justificatory basis of its alleged ability to contribute toward the fulfillment of emancipatory values.

In the developed exercise, it was argued that even if the unconscious is *un*true, and this truth could provide an accurate representation of the world, it would be undesirable, because the effects of the ensuing phenomenological attitudes would be *un*desirable. From a complementary viewpoint, the absence of desirable effects that could have been the case had a possibly untrue unconscious been accepted as true would itself be undesirable. In short, it seems preferable to commit to the reality of the unconscious even if constructionists are right and Freud wrong.

Having argued for the desirability of the existence of the unconscious, I then returned to the question of metatheories to highlight how realist metatheories may enable scholars of organizations to whistle the theories that they desire, (more) effectively. And even if metatheories may not palliate the (objective) uncertainty of the world, they seem pragmatically indispensable given that social scientists have to "apologize" to the epistemologist and "survive" the scientistic mood of the era, still haunted by the ghost of the positivist methodologist. As such, realist metatheories *need not* be seen as an end in themselves, but may be also valued a means for the transition into a postanalytic epoch for the social sciences.

To conclude, responding to Wittgenstein's and Ayer's admonitions on the limits of meaningful discourse, it may be the philosopher's duty to do good philosophy, yet an organizational scholar may do good to the organizational landscape by whistling what the philosopher must pass over in silence.

A Case for Flexible Epistemology and Metamethodology in Religious Fundamentalism Research

Carter J. Haynes[1 2]

Abstract: After reviewing a representative sample of current and historical research in religious fundamentalism, the author addresses the epistemological presuppositions supporting both quantitative and qualitative methodologies and argues for epistemological flexibility and metamethodology, both of which support and are supported by metatheoretical thinking. Habermas' concept of the scientistic self-understanding of the sciences is used to point up the limitations of positivist epistemology, especially in the context of fundamentalism research. A metamethodological approach, supported by epistemological flexibility, makes dialogical engagement between researchers and those they research possible, and an example of how this would look in an actual research design is provided. The article concludes with a theoretical statement and graphic representation of a model for dialogical engagement between Western scholars and non-Western religious fundamentalists. Such engagement, the author argues, is necessary before any real progress on the "problem" of radicalized fundamentalism can be made.

Keywords: Epistemology, fundamentalism, Habermas, metamethodology, metatheory, positivism.

The purposes of this article are to review a representative sample of religious fundamentalism research, comment on the various epistemological positions it represents, make an argument for an inclusive approach to epistemology and methodology, and relate these first three purposes to the larger project of metatheory. Given the changes that have taken place in Western consciousness since 9/11, it seems important to summarize and reassess the direction and impact of the research that is meant to help us understand fundamentalist movements. Because most of the studies in this area are conducted by Western researchers and published for a Western audience, questions about how academics come to "know" things about non-Western fundamentalists are relevant. In the case of Islamic fundamentalist movements, a vast cultural gap separates the individuals being studied from those researching them. How do well meaning

SOME RIGHTS RESERVED

but culturally and intellectually disconnected investigators find useful epistemological approaches to studying these phenomena? Is fundamentalism research more epistemologically attuned to the object of its study or to the positivistic bias characteristic of Western intellectual discourse? Does the epistemological hegemony attendant to the scientific method contribute to other kinds of hegemony, including those that some believe are the root causes of fundamentalist movements? How can metatheoretical thinking help us to assess, organize and synthesize religious fundamentalism research in new and helpful ways? This is the sort of question that is at the heart of this article.

I will explore religious fundamentalism using a metamethodological perspective that calls for epistemological flexibility. I am defining “epistemology” classically: one’s theory of knowledge, of how it is possible to know something. The term “metamethodological” refers to a sensibility that derives richness from the cumulative consideration of a wide variety of methodological approaches. Metamethodology is similar in intention to metatheory. Both activities are aimed at finding commonality, building bridges, identifying overarching concepts, and utilizing any synergies that result. I will stress the need for epistemological flexibility both because it is necessary to support metamethodology, and because it is a prerequisite for dialogical engagement between parties whose native epistemologies are not compatible (i.e., between Western academics and fundamentalist believers). There are also parallels between epistemological flexibility and metatheory. During the development of metatheoretical constructs, walls between previously unassociated concepts, theories, and schools of thought must be broken down so that new, integrated knowledge can be developed. Though it is not often stated in these terms, some measure of epistemological flexibility is necessary for metatheoretical knowledge production.

Before beginning my formal survey of religious fundamentalism research (and some of the epistemological, methodological, and theoretical issues arising from it), I will offer some definitions of religious fundamentalism. A word about the role of positivism, and a brief discussion of the question of causation, will round out the introductory portion of the essay. Next, the survey of the literature will be presented, and the article will conclude with discussion and practical application.

Religious Fundamentalism Defined

Sociologist of religion Martin Riesebrodt Riesebrodt (2000) notes that:

> the term fundamentalism emerged in early twentieth century American Protestantism to designate a religious movement which, among other things, opposed biblical criticism, the teaching of evolutionism, and the philosophy of Nietzsche while advocating biblical literalism, strict patriarchal moralism and authority, prohibition, control of social vices and self-control. (p. 269)

He defines fundamentalism as being associated “with religious orthodoxy, often literalism, and rigid moralism, especially with regard to sexual morals and gender relations, as well as intolerance, anti-pluralism, and anti-modernism” (Riesebrodt, 2000, p. 271).

Since the Iranian Revolution in 1979, the term “fundamentalist” has come more into common usage as meaning any religiously extreme individual or movement, especially those that sometimes resort to violence to accomplish their goals. Almond, Appleby and Sivan (2003, p. 116) define fundamentalism as “a set of militant, mobilized, antisecularization movements arising in the course of the twentieth century.” A more detailed and religiously-focused definition has been suggested by Altemeyer and Hunsberger (1992). They see fundamentalism as:

> the belief that there is one set of religious teachings that clearly contains the fundamental, basic, intrinsic, essential, inerrant truth about humanity and deity; that this essential truth is fundamentally opposed by forces of evil which must be vigorously fought; that this truth must be followed today according to the fundamental, unchangeable practices of the past; and that those who believe and follow these fundamental teachings have a special relationship with the deity. (p. 118)

The Role of Positivism in Fundamentalism Research

Too often, the epistemological foundation necessary to engage in scholarly work is assumed or not considered carefully enough. Analyzing and addressing the epistemological foundations for research questions and methodologies can shed fresh light on past work, identify unstudied areas that may be fruitful topics for future research, and strengthen the critical analysis of a body of literature. Traditionally, modern scientific inquiry has been both based on and consonant with the philosophy of positivism, which holds that truth is derived from empirically validated and objectively measured data. Positivism was born in an atmosphere of confidence about scientific discovery. The industrial revolution and subsequent meteoric rise of technological advancement created the perception that universal laws formed a dependable, unquestioned and self-evident intellectual structure (Bentz & Shapiro, 1998, p. 21). The emphasis on logic, structured design, and cognitively generated solutions were translated, first among intellectuals and later by the general public, into the view that rational thought under girds all truth. Like many widely accepted philosophical positions, the popular version of positivism eventually took on an almost religious fervor, which allowed adherents to remain in denial about the gnawing problems that science could not solve: those ancient tendencies among the human race toward avarice, greed, cruelty, hatred, isolationism, and racism that were brought back in to clear relief in the aftermath of the Holocaust (Bentz & Shapiro, 1998; Habermas, 1971).

Because they focus on numbers and objective measurement, the research methodologies arising out of the positivist worldview are often termed “quantitative.” In light of the difficulties encountered by using traditional quantitative methods to study the nuances of fundamentalism, Almond, et al. (2003, p. 117) opt for a more open and flexible theoretical structure that takes into account the heterogeneity of social reality. “In trying to generalize about causation from a relatively small number of very complex cases… [one finds that] there are not enough cases to establish statistical significance with confidence.” Almond’s attempt to address this problem is evidenced by “increasing rigor and systemization in case study research, comparative historical analysis, and the adaptation of statistical analysis to small numbers.” More on this “qualitative” approach to fundamentalism research will be presented later in this article.

Droogers (2005) makes the observation that positivists and religious fundamentalists are similar in some ways:

> positivists hold that the term ‘reality’ refers to a singular entity . . . so too do fundamentalists hold that there is but one form of the sacred reality. . . . Accordingly, there is only one ‘grand’ story to be told about this reality. In the case of both fundamentalist believers and positivist scholars, the reality that they focus on is driven by laws and rules. . . . Fundamentalists and positivists seek to impose a rather monopolistic, centripetal, law-based and strict view of the world. (p. 469)

Notwithstanding this analogical comparison between the approaches taken by religious fundamentalists and positivist scholars, it is important to remember that positivism is a philosophical position resulting in a particular epistemological set while fundamentalism is a religious conviction resulting in a particular way of life. Even so, there does seem to be a parallel between the tendency of positivism to reject all “truth” that cannot be observed using empirical methods and the tendency of fundamentalist believers to reject claims that are not in line with accepted doctrine. Being completely sure of our own position can blind us to solutions our native epistemology does not allow us to perceive, and this can be equally true whether the “proof” that backs up our favored position is “scientific” or “theological.”

The Question of Causation

One debate among social scientists who study religious fundamentalism involves the question of causation. One way of stating the question is:

> Are individuals and communities truly motivated by their religious convictions to take personal, social and political action, or is the religious context only a palatable justification for the actions those individuals or communities would have taken anyway for personal, social, or political reasons? (Bruce, 2000, pp. 102-103)

In searching for an answer, positivist epistemology would most likely lead to empirical analysis of fundamentalism using quantitative methods, but positivist epistemology cannot account for phenomena outside the measurement capacity of scientific observation and analysis. For example, even though religiously motivated actions or behaviors can be quantified, purely spiritual aspects of religious experience do not lend themselves to the kinds of questions that science asks. In other words, because spiritual (i.e., non-empirical) phenomena cannot be observed (except through the actions or behaviors they may produce), they are more appropriately the terrain of researchers who are not bound by the strictures of the scientific method and a positivist epistemology. Hence, the answer to the question of causation depends, in part, upon the epistemological lens through which the question is examined. A positivist approach would likely produce a mechanistic interpretation of human behavior (religious or otherwise) that bypasses the issue of spiritual agency (because that agency cannot be measured). By way of contrast, a relativist epistemology would likely allow for the attribution of religious motivation to spiritual agency. This is because a relativist epistemology would not require that the methodologies employed to examine the question of causation hold to standards set by the scientific method.

One of the epistemological questions confronting the study of religious fundamentalism has to do with the effect of epistemological set on perception. Stated as a question, we might ask, “Is it possible for a positivist scholar and a fundamentalist believer to observe the same phenomenon and perceive different ‘truths’ because of their divergent epistemologies?” Take prayer as an example. The scholar could measure the physiological responses of the adherent, or make observations about post-prayer changes in behavior. The believer could have a profound or even life changing experience during that same prayer, but because the believer and the scholar are attending to different aspects of the phenomenon (i.e., are perceiving the prayer through different epistemological lenses), they have no common reference points at which they can connect and dialogue. From metatheoretical perspective, one supported by epistemological flexibility and informed by metamethodology, I am choosing to answer “yes” to this question (i.e., that divergent epistemologies *do* cause divergent perceptions and estimations of truth). I am also making the judgment that dialogical engagement is of utmost importance in the study of religious fundamentalism, and am therefore led to the conclusion that a strictly positivist epistemology is incompatible with productive fundamentalism research. Epistemological flexibility, it will be argued, is key to the development of a metamethodological approach, which, in turn, is key in the development of dialogical engagement.

This is not to say that positivist epistemology and the quantitative methodologies associated with it are not helpful in the study of religion. As will be seen in the following review of the research literature, salient and interesting facts about religious behavior have come from using quantitative techniques. But in order to enter a dialogical environment, at least two things are required. First is what I am calling metamethodology: an integrative, flexible and inclusive approach to research methodology that places equal value on quantitative and qualitative methodologies. Second is the epistemological flexibility that is demanded by a metamethodological approach. Since distinct methodologies flow from distinct philosophical theories of knowledge, metamethodology implies the ability to bridge the epistemological divide that has separated positivists from those ascribing to other positions.

A Survey of Religious Fundamentalism Research

Quantitative Approaches

One area of study that has been mined using quantitative methodologies is the relationship between religious fundamentalism and right-wing authoritarianism. For example, Miller and Wattenberg (1984) used national survey data to assess the effect of evangelical religious identification on voting habits. They categorized respondents according to the strength of emotional attachment to fundamentalist interests and religious beliefs and then analyzed the associations between fundamentalist attachment, policy preferences and voting. The authors used descriptive statistics to arrive at demographic characteristics of fundamentalist voters and then applied correlational and factor analyses to determine the magnitude of individuals’ affective connections to fundamentalist thinking.

In a related study, Jelen and Wilcox (1991) used survey data to develop an index of religious dogmatism as measured by doctrinal orthodoxy and public religious activity. Predictive statistics indicated that the dogmatism construct accounts for a significant portion of the variance associated with respondents' attitudes about personal freedom. In another study, these authors (Jelen & Wilcox, 1992) surveyed financial contributors to Republican presidential candidates to explore the relationship between religious self-identification and attitudes toward the Christian Right in the U.S. Respondents self-identifying as fundamentalists evidenced the highest level of support for Jerry Falwell's Moral Majority.

Quantitative social research also focuses on the relationship between fundamentalism and sexism. One project analyzed both individual and group fundamentalisms with respect to attitudes about women. Researchers designated participants who said they believed in the Bible as literally true "individual fundamentalists" and used denominational affiliation to identify "group fundamentalists." Respondents' affect (positive or negative) toward public leaders of the Christian Right was the dependent variable. Independent variables included the self-identification of participants as fundamentalist, evangelical or charismatic. A two-stage process of bivariate analysis (Christian Right affect and religious self-identification) preceded a multivariate procedure that attempted to uncover unique effects of religious self-identification while controlling for other independent variables such as attitudes toward the ACLU, feminists, and liberals. The authors found that sexist attitudes were connected with both individual and group-level fundamentalisms. For women, sexist attitudes were a function of individual as opposed to group-level fundamentalism, but for men the opposite was true (Peek, Lowe, & Williams, 1991).

Another study investigated the relationship between the number of fundamentalists living in various states in the U.S. and the overall level of conservatism among whites in those states. Larger fundamentalist populations were correlated with more conservatism in the general Caucasian population. This relationship was strong even after experimentally controlling for the religious affiliation, beliefs, and practices of individuals (Moore & Vanneman, 2003).

The hypothesis that southerners would evidence more prejudice than those from other regions because fundamentalism is more common in the southeastern U.S. led another group of researchers to study the relationship between fundamentalism and prejudice by region of the country. An analysis of data from the 1988 general social survey did not fully support the supposition, but the authors did find significant regional differences in fundamentalists' tolerance of communists, atheists, gays and lesbians (Ellison & Musick, 1993).

Psychometric research shows the Religious Fundamentalism Scale to be psychometrically sound and has helped researchers measure several kinds of prejudice and authoritarian aggression. This instrument was standardized on college students (and their parents) from mostly Christian backgrounds. *Post hoc* item analysis yielded solid intercorrelations between the Religious Fundamentalism Scale and other scales used to measure prejudice (Altemeyer & Hunsberger, 1992).

In a critique of the Religious Fundamentalism Scale, Watson, et al. (2003) highlight what they see as ideological bias. Through psychometric isolation of anti-religious sentiment in the wording of items, they determined that the scale "describe[s] 'fundamentalism' relative to unsympathetic normative assumptions" (p. 317). By translating the original items of the scale to remove such bias and then administering both the original and translated versions to the same subjects, these investigators made both a quantitative and a theoretical critique of what they saw as the ideological preconceptions held by the scale's authors.

Another set of researchers used multiple regression analysis to demonstrate that authoritarianism can statistically predict prejudiced attitudes against people of color and gays and lesbians. Controlling for authoritarianism, however, produced a positive correlation between fundamentalism and homophobia but a negative relationship between fundamentalist attitudes and racial prejudice. Based on these findings, the authors theororized that Christian fundamentalism "consists of a second major component other than authoritarianism—related to Christian belief content—that is inversely related to some forms of prejudice but not others (Laythe, Finkel, & Kirkpatrick, 2001, p. 1).

Summary: Quantitative Approaches

As can be seen from this sampling of quantitative research studies on religious fundamentalism, important knowledge has been produced using these methodologies. The observant reader will have noticed that all the studies cited thus far have investigated North American fundamentalist movements. Quantitative studies of non-Western fundamentalist groups were sought but not found. To the extent that religious constructs can be quantified, the relationships between phenomena such as authoritarianism, political affiliation, policy preference, dogmatism, social and gender issues, prejudice, and aggression can be analyzed as a source of descriptive and comparative data. One of the strengths of quantitative methods is that otherwise amorphous concepts and confusing relationships can be presented logically and, often, with clarity. The value of being able to compare fundamentalism directly with other known behavioral phenomena is immense, and the empirical sensibility that originally grew out of positivist epistemology brought us this "common language" of quantified constructs.

There is also something missing in a purely quantitative approach to fundamentalism. We see nothing of the quality of individual lifeworlds, or of the rich, human texture of religious fervor, spiritual devotion, and doctrinal certainty. Qualitative methodologies were, in part, created to access aspects of research "data" that are not adequately understood or described by quantitative methods.

Qualitative Approaches

Qualitative methodologies are more flexible than quantitative study in terms of both associated epistemology and the range of techniques available to researchers. Several qualitative techniques, as they have been applied to fundamentalism research, are discussed here.

Typology and Grounded Theory

The largest and most comprehensive research endeavor undertaken to date regarding religious fundamentalism is the *Fundamentalism Project of the American Academy of Arts and Sciences*, a "decade-long interdisciplinary public policy study of antimodernist, antisecularist militant religious movements on five continents and within several world religious traditions" (Almond, et al., 2003, p. 6). This study was primarily concerned with three questions: (a) "What are the local, regional, and global contexts for, and triggers of, the emergence of fiercely antimodernist, antisecular movements from within virtually every major world religion in the twentieth century?", (b) "What characteristics do these movements share across religious, cultural, and political borders?", and (c) "Are fundamentalist movements, whatever their places of origin and everyday activity, capable of extending their influence transnationally" (p. 6)?

One of the books arising from this massive study is *Strong Religion: The Rise of Fundamentalisms Around The World* (Almond, et al., 2003). This volume describes a process of data collection and analysis that eventually led to the formulation of a grounded theory of fundamentalist movements. The authors developed an extensive typology through methodical coding and categorizing of group characteristics along several different continua. For example, the following ideological characteristics of fundamentalist groups transcend national, religious, cultural and ethnic differences in the cases analyzed: reactivity to the marginalization of religion, selectivity (of texts or doctrines), moral dualism (right or wrong, good or evil), absolutism or inerrancy, and the idea that history has a miraculous culmination. All the cases studied were assigned a rating for each of these measures based on the extent to which that particular case demonstrated the characteristic. Matrices were then developed to graphically represent gradations of various characteristics within and between groups.

The theoretical model presented in *Strong Religion* asserts that all fundamentalists share a "family resemblance" regardless of religious or other contextual demarcations. Specifically, all fundamentalists are united in their identification of three distinct antagonists to their cause: the corrupt or compromised religious establishment, the secular government, and the secularization of modern society. This framework is further delineated using the concepts of *structure* (long-term contextual conditions), *chance* (contingent random factors) and *choice* (the element of human leadership). Each domain (structure, chance, choice) is divided into sub-domains and coding systems are used to categorize cases based on both domain and sub-domain ratings. For example, the sub-domains for structure are education, communication, civil society, social structure, mobility, ethnic-regional factors, economic development, political characteristics, and international environment (Almond, et al., 2003, pp. 116-132).

Max Weber's (1922/2008) typology of religious attitudes has also been applied to the analysis of fundamentalism. His system offers two continua on which to place religious phenomena: approval/rejection and control/adaptation/withdrawal. Fundamentalist attitudes on the one hand reject secular society and, on the other, might evidence a desire for world control or withdrawal from society depending on the organizational form of the particular group. Withdrawal can be symbolic, as in the formation of a subculture, or geographical, resulting in a commune. Control may take the form of a religious movement, social protest, secret society or political party (Riesebrodt, 2000).

Hermeneutics

Modern fundamentalist doctrine is based on text, whether the Bible, Quran, or other sacred document. This fact situates the discussion of fundamentalist movements within the realm of hermeneutics. Originating in the context of scriptural interpretation, hermeneutical inquiry was later applied to secular texts, and then to non-textual phenomena.

Bloom (1992) contrasted divergent interpretations of sacred texts in his commentary on protestant fundamentalism. He compared the scholarly practice of biblical interpretation, based on the original language, meaning, and context of biblical literature, with what he saw as the idiosyncratic and often agenda-based interpretive strategies used by some fundamentalist pastors. These two hermeneutic methods produce different meanings from the same texts, and those differences can be used to further explore what protestant fundamentalists find important to emphasize.

Pizzuto (2007), focusing on Islamic fundamentalism, appealed for objective criteria that can be used to distinguish valid interpretations of sacred texts from invalid ones. He maintained that people of faith have only the narratives and symbols of their religion to defend themselves against the lure of power, meaning, and significance promised by violent extremism. When scripture is interpreted to support violence, effective gestures toward peace must be theological, must start with the presumption of faith, and must challenge religious traditions from within. Pizzuto suggested that we distinguish between valid and invalid interpretations and use valid interpretations to help transform fundamentalist religion from the inside. Uncritical use of scripture to advance a fundamentalist agenda can result in the conviction that God condones violence against the “other” (i.e., non-believer) in the name of moral righteousness or religious purity.

Bartkowski (1996) has pointed out that, among Christians, evangelicals view the Bible as inspired and authoritative but are also able to allow for metaphorical interpretation. Fundamentalists, on the other hand, insist that the Bible is infallible and literally true. Many take a concrete, anti-interpretive, anti-metaphorical stance toward scripture. Understanding the various camps of Christian interpretation quickly becomes complicated when hermeneuticists move beyond the inspired versus inerrant debate. Inerrantists can be further divided into subcategories based on their particular hermeneutic sensibilities and tolerances. According to Barnhart (1993), these subgroups include:

> (1) those who subscribe to *extended inerrancy*, and thereby insist that ‘when Scriptures affirm something as true, it is true exactly and precisely as stated’, (2) those committed to *limited infallibility*, in which minor conflicts in textual reports of a specific event (e.g., the Resurrection) are believed not to imply that the event never happened; and lastly (3) those who argue for *appropriate inerrancy*, thereby attempting to distinguish the ‘essential truths’ of the Gospel (which are believed to be without error) from the Bible’s non-essential qualities (e.g., pseudonymous writings, scientific inaccuracies, cultural accommodations). (Barnhart, 1993, p. 260)

Ethnography

Ethnography is particularly adapted to the witnessing, experiencing and exploration of otherness. Arising from within Cultural Anthropology, ethnography has more recently been embraced by sociologists, historians and others investigating the differences between people, cultures, societies and organizations. Some social phenomena cannot be perceived or appreciated except through immersion of the researcher into the culture being studied, and this immersion, coupled with specific analytical procedures, is what makes ethnography unique from other qualitative methodologies (Bentz & Shapiro, 1998).

A well-known example of ethnographic enquiry is Edward Said's book *Orientalism* (Said, 1978). Part of his thesis was that modern cultures do not develop in isolation. There are reciprocal economic, social and power differentials that characterize the divergent historical experiences of Eurocentric and Eastern individuals. Therefore, the development of the Occidental identity required the subsequent and complementary social construction of the "Oriental" identity. Because the Oriental identity was formulated by Western academics and intellectuals without the knowledge or involvement of those it purports to describe, Said labeled these Western thinkers "Orientalists."

In bridging the cultural and epistemological divide between East and West, both in terms of his personal immersion and his scholarly writings, Said was one of the first to point out that individual cultures hold "the naïve belief in the certain positivity and unchanging historicity of a culture, a self, a national identity" (Said, 1995, p. 2). Many Westerners see Western ideology and culture as superior to Eastern ideas and practices. Said would contend that Orientalism has led to an intellectual and popular environment in which Asian, Indian and Middle Eastern cultures appear less human, weaker, and less sophisticated than cultures of European decent. In addition to pointing out that the West's Orientalist portrayal of the East was volitional and subjugating, Said railed against "the creating of entities essentialising a region or a people, whether it be East or West. His endeavour [was] precisely to demolish the conceptual constructions that divide the world into confrontational cultures or hierarchical civilisations" (Ferial, 2004, p. 124).

Zaidi (2007, p. 424), in a recent assessment of "the Orientalist essentialization of Islam," pointed out that most Western scholars critique the ideological content of Islam rather than embracing a dialogical hermeneutic.

> Such a critical approach to Islam and Muslims has only grown stronger since the 1970s, when western academic interest shifted from the relatively humanistic interest in the religion of Islam to social-scientific explanations of Islamic fundamentalism. What has gone largely unremarked in this shift from a perspective informed by the humanities to one informed more by the social sciences is the slippage that occurs by shifting from a focus on the fundamentals of Islam to Islamic fundamentalism…. Since then, the analysis of Muslim societies has been replete with such critical accounts, which, while they break with the classical Orientalist scholarship that regards the religion of Islam as the sole defining element of Muslim backwardness, continue to treat the self-knowledge of Muslims as impure, as mere ideology. (p. 414)

Comparative-Historical Inquiry

The concept of the "enclave culture" was developed using both ethnography and comparative-historical inquiry. The enclave construct is a way of formulating and describing the group psychology, worldview and sensibilities common inside fundamentalist movements. The study that led to this construct compares religious and cultural movements that eventually resulted in fundamentalism with those that did not (Almond, et al., 2003, Chapter 1). Using *exile* as a metaphor, the marginalization of religious activity and thought in developing countries was taken as a common existential aspect of fundamentalist groups. The idea that members are fighting for survival and moral purity against the seemingly intractable movement of modernization (away from righteous living and religious viability) figures prominently in the social psychology of fundamentalist groups. The enclave culture has a unique cosmology of physical time and space. Although a religious movement at its core, the enclave is also contextualized within the wider historical and cultural environment. In the enclave, historical time:

> tends to be somewhat shrunken, collapsed, and condensed. The past is reduced to a few key eras, closely related to the enclave’s notions as to what accounts for the glory and decline of the tradition; it is, hence, intensely relevant for the present. The future perspective is likewise rather short; the more radical the enclave, the shorter it is. Its overall bent is pessimistic if not doom-laden. (Almond, et al., 2003, pp. 56-57)

Metatheoretical Research and Critical Social Theory

Metatheoretical inquiry and social theory are discussed together because the overlap between them is substantial. Metatheoretical research refers here to a method of gathering together existing theories relating to a particular topic, assessing strengths and weaknesses, and reviewing criticisms. The metatheoretical researcher then looks for patterns, themes, discontinuities and possible overarching theoretical content in preparation for constructing a unique extension of theoretical knowledge. The unique foci of critical social theory are the relationship between research and the surrounding social justice context, the betterment of society, and the amelioration of human suffering and oppression. Critical social theory has been used to critique social policies and institutions as they contribute to racism, oppression of the poor, the subjugation of women, and other misuses of power. One method of applying social theory is to compare the stated purpose of powerful individuals, institutions or governments with the social results produced by their actions. When inconsistencies are identified, especially when they point to the oppression of marginalized groups, researchers can attempt to exert pressure for change on those in power (Bentz & Shapiro, 1998).

Coreno (2002) used metatheoretical inquiry to combine two traditional sociological paradigms, the class model and the culture model, in an effort to better understand religious expression. The class model, in the tradition of Karl Marx (Marx & Engels, 1967) and Max Weber (1922/2008), explores the link between class location and religious belief and behavior. The culture model, by contrast, “emphasizes religion’s power to create shared commitments across class boundaries” (Coreno, 2002, p. 340) and is associated with Durkheim (1976). By synthesizing these two paradigms into the “class culture model," Coreno attempted to demonstrate that religious beliefs and practices often “define the symbolic boundaries of distinct class cultures” (Coreno, 2002, p. 343). To test this model, he employed quantitative analysis of survey data. Using descriptive statistics, correlation analysis, and regression analysis, he showed that class and culture together provide a more robust model for understanding religious phenomena than either class or culture alone.

Schmalzbauer (1993, p. 331) has drawn attention to the existence of a “new class” in North American societies in which there is a strong relationship between professional/managerial employment and political and moral liberalness. Study of these "knowledge class" workers can help to clarify the roles of both class and subculture in defining ideology. Christian evangelical new class workers are members of both a religious subculture that embraces conservative social values and a work force that is characterized by liberal attitudes. Schmalzbauer found that evangelical members of the knowledge class strongly resist any relaxation of their moral position regarding sexuality, but that significant liberalization takes place regarding abortion, civil liberties and gender roles. Conservative Christians continue to resist the liberalizing effects of higher education even after becoming consumers of it.

Critical social theory can provide a context for discussion of the root causes of fundamentalism. For example, in an attempt to set the stage for a critique of the power structures and geo-political alliances that were in place on 9/11, Wallace (2003) noted several grievances held against the U.S. as a result of its Middle East policy.

> The issue is not one of indirectly supporting regimes through buying oil from them. . . . Rather, the USA arms almost everyone in the region. Not only does it not encourage democratic reform, it actively suppresses it. Consider American support for the three-decades-long Israeli occupation of West Bank and Gaza. Consider CIA support in 1953 for the Shah as he crushed a fragile emerging constitutional democracy in Iran. Consider also that our [USA] government is the principal backer of the massively corrupt regime in Saudi Arabia, which, when not exporting oil, exports Wahabism around the world, an especially intolerant species of militant Islamic doctrine to which Osama Bin Laden and many of his top lieutenants apparently belong. Valid criticisms, grievances, real offenses, open wounds: in short, a history of social injustice lies at the heart of Muslim opposition to the United States. (pp. 493-494)

Wallace (2003) went on to suggest a Habermasian foundation for a critical theory relating to the ongoing ideological, cultural and political conflict between militant Islamic fundamentalists and the West. Habermas sees modernization as a historical process in which societies are progressively rationalized over time. This evolution is marked by intermittent backsliding, stasis, and struggle. Habermas posited a number of developmental stages through which societies pass, and holds that societies progress from "tribal," to "traditional," to "modern" over time. "In tribal societies, religious-based kinship structures govern virtually all social interaction, determining conduct in accord with the sacred and transcendent" (Wallace, 2003, pp. 503-504). Societies in which (non-Western) fundamentalists live are mainly "tribal" or "traditional" and Western countries are "modern." This disparity may help to explain the difficulties inherent in building a dialogical bridge to span the distance between fundamentalists and the Western researchers who study them.

The progressive modernization and secularization of society are at issue for many fundamentalist groups, especially those outside North America. The tension between Islam in the Persian Gulf region and the forces of modernization helps to explain "the events of 11 September as an episode in the ongoing historical drama of modernity itself" (Wallace, 2003, p. 510). Although modernization has been somewhat spontaneous in the West, Islamic countries see it as an import grown elsewhere. Wallace has hypothesized that there is a clear connection between the introduction of modernity in the Middle East and an "especially virulent religious backlash"

(p. 510). When modernization is imposed from the outside, even though it may be promulgated by governmental representatives within Islamic society, it is perceived as being both a Western commodity and a tool used by the local elite to consolidate power and wealth (Wallace, 2003).

Langman (2005) offered insight into the role modernization and globalization have played in the development of religious fundamentalism. In addition to creating rapid social change and dislocation related to rural-urban migration and class mobility, globalization has disseminated “rational, secular worldviews and mass mediated forms of privatized hedonism from consumerism to eroticism that are an affront to the values and identities of many traditional people – especially those already disadvantaged by the global economy” (p. 258). Globalization is interpreted by many fundamentalist leaders as eroding the authority of elders, challenging values and morals, and disrupting social structures and gender relations. Thus, the ascent of religious fundamentalism can be seen as a response to globalization. Langman’s critical theory holds that capitalist modernity, in addition to the benefits often touted, brings new forms of domination and “a cold, sterile, lonely dehumanized world of conformist ‘cheerful robots’ seeking consumerisms… in an ever more frantic attempt to secure a meaningful identity in a meaningless world” (p. 270).

In a recent example of social criticism related to Islamist terrorism, Cigdem (2006) warned against denouncements of terrorist acts that do not also criticize terrorism’s foundations. He was careful to point out that fundamentalism can present a healthy challenge to the religious institutions that have collaborated with repressive political regimes, but also made clear that terrorism cannot be justified under any circumstance. Islamic fundamentalism and Islamic terrorism are two separate phenomena. Terrorist acts of self-proclaimed Islamic militants are not the result of the “religious orientation of postmodern Islamic expansionism,” but “one of the consequences of American hegemony and of the European Union’s reluctance to confront global inequalities and political inconsistencies” (p. 162).

Summary: Qualitative Approaches

The knowledge we can glean from qualitative investigation of religious fundamentalism is often broader but less specific than quantitatively derived results. There is a clear trade off here. We are trading away empirically based observation and measurement of the behaviors and constructs associated with fundamentalism, but we are gaining a more descriptive and sweeping landscape of (less specific and measurable) information. As mentioned, the epistemological position historically associated with the scientific method and its quantitative methodologies is positivism. The epistemologies that have helped pave the way for qualitative techniques are quite diverse. For example, in addition to being a methodology, hermeneutics is also a distinct epistemological perspective (see Gadamer, 1976; Ricoeur, 1981). The qualitative methodologies that do not have connections to specific epistemological positions evidence an epistemological flexibility not characteristic of the scientific method. An ethnographer or social theororist, for example, is generally free to draw from a range of epistemological positions, as long as she can make a convincing argument for how her theory of knowledge supports her truth claims as they relate to her methodologies.

This flexibility has pros and cons. The epistemological position of positivism is limiting in that it restricts the researcher to only what can be perceived and measured empirically, but quantitative methodologies do have the advantage (generally speaking) of producing the kind of data that can be compared meaningfully with data produced in similar quantitative studies. This can usually not be said of investigations that employ qualitative methods.

One comparative advantage of qualitative methods, and the epistemological flexibility associated with them, is their ability to cast a wide net in exploring religious phenomena. Because qualitative inquiry is more flexible than quantitative inquiry, it is more adaptable to the particular phenomena being studied. In the case of religious fundamentalism, this is important because much of what interests scholars does not lend itself to the precise demands of the scientific method.

The typological analysis described by Almond, et al., (2003) for example, provides a way of categorizing a wide array of fundamentalist movements. But typology requires some level of subjective judgment about which category an item should be placed into. Similarly, the grounded theory of "family resemblance" would not have been possible without the authors' willingness to take certain intuitive leaps that cannot be justified scientifically.

Hermeneutic study provides a rich source of information about how fundamentalist groups interpret and interact with their sacred texts. Because scriptures play a central role in many religions, the tools of hermeneutic inquiry have become an important part of fundamentalism research. But hermeneutic findings are of a different nature, and are supported by different epistemologies than, say, survey findings subjected to statistical analysis. In the same way, critical social theory is a valuable source of conceptual data regarding the root causes of fundamentalist expression, especially outside North America. Through it we have been able to understand that there is likely a relationship between militant Islam and Western hegemonic domination. Though this theoretical structure could not have been arrived at without the use of different rules and methodological standards than those supported by positivist epistemology, I personally find it one of the most convincing and inspiring scholarly arguments related to religious fundamentalism.

Having laid out examples of both quantitative and qualitative research into religious fundamentalism and argued for the indispensability of both, I will now proceed to a discussion of the significance and problematic nature of the epistemological divide that tends to separate scholars with positivist leanings from those who embrace the epistemological flexibility demanded by qualitative methodologies. This divide is, in my view, akin to the divide between fundamentalist believers and non-fundamentalists. I am taking a more practical or applied turn at this point in the article as I move from examination of scholarship and its epistemological foundations to how scholarship, epistemology and metatheororizing might mirror and contribute to the real world problems of fundamentalist isolation, radicalization and militancy.

Discussion

Scientistic Self-Understanding as a Limitation of Positivism

The differences between quantitative and qualitative methodologies (and between varying qualitative techniques) point up the diverse theories of knowledge that support methodologies by providing the philosophical foundation on which to lay truth claims. Thus far, I have made, somewhat indirectly, a number of points that I would like to now bring to the foreground. First, although quantitative methodological approaches to fundamentalism research produce important knowledge, the primary epistemology informing quantitative methods is positivism. As Habermas ably pointed out in *Knowledge and Human Interests* (1971), positivism as an epistemological position has led to the scientistic self-understanding of the sciences, which means that, through circular reasoning, science lost the ability to critique itself philosophically.

> Positivism certainly still expresses a philosophical position with regard to science, for the scientistic self-understanding of the sciences that it articulates does not coincide with science itself. But by making a dogma of the sciences' belief in themselves, positivism assumes the prohibitive function of protecting scientific inquiry from epistemological self-reflection. Positivism is philosophical only insofar as is necessary for the immunization of the sciences against philosophy. (Habermas, 1971, p. 67)

Habermas' point here is that science understands itself in a way that precludes accurate self-reflection because positivism categorically excludes science from the need for epistemological self-questioning. This exemption is accomplished by the positivist definition of "truth" as objective, measurable, etc. In short, positivism defines truth as scientific truth, and this puts science in the role of examining everything except itself.

There exists an epistemological divide between quantitative and qualitative methodologies, and between fundamentalists and the scholars who study them. Not that these two fissures are identical, but they have parallels, and my task now is to argue for a dialogical and tolerant approach to both areas of division. Habermas' solution to the epistemological roadblock thrown up by scientistic self-understanding was to construct his own empirical epistemology to support "empirical-analytic" inquiry, which remained open to philosophical critique and dialogue. Though Habermas' new epistemology has not come close to overtaking positivism, he was able to lay philosophical groundwork in *Knowledge and Human Interests* to support what would later become known as "qualitative" research. My interest in this early project of Habermas lies in his identification of the rigid insularity of positivism and the effects this philosophical isolationism has had on scientific inquiry.

The application of the association between scientistic self-understanding and positivism to our current topic rests on the association already made between positivist epistemology and quantitative methodology. Fundamentalism researchers who are wedded exclusively to the positivist project at the level of epistemology will be limited in their ability to study fundamentalism at the level of methodology. Scientistic self-understanding is insular, self-assured, and dependent on pre-conceived notions about the reliability and validity of the scientific method. Fundamentalist believers are insular, self-assured, and dependent on preconceived notions about reliability and validity of their faith and doctrine. Dialogical engagement between researcher and researched requires a break with positivism so that the epistemological distance between scientific “fundamentalism” and religious fundamentalism may be bridged.

Metamethodology as an Antidote for Scientific Insularity

The second point I have tried to make, and will elaborate on here, is that a metamethodological approach to religious fundamentalism is more helpful and informative than focusing on one technique or category to the exclusion of others. This is partly because of the multi-faceted nature of religious fundamentalism research. Fundamentalist believers do produce actions that can be measured, attitudes than can be quantified, and political activity that can be observed, but religious fundamentalism also evidences aspects that are not amenable to empirical study.

Metamethodological approaches must, by definition, be supported by a flexible epistemological sensibility, one that can appreciate the scientific worldview, but also other epistemological positions. As has been mentioned, metamethodology and flexible epistemology both evidence important convergences with metatheory. In fact, it can be said that metamethodology is the methodological equivalent of metatheory. This direct comparison has clear limitations, mostly owing to the categorical separation between theory as a formulation of knowledge and method as a form of data collection. But the comparison is still, I think, helpful conceptually, especially in light of the connection between methodology and epistemology. The complex phenomenon that is religious fundamentalism is best studied using a variety of methods and theories of knowledge, and both metamethodology and epistemological flexibility support and are supported by metatheoretical thinking.

In order to travel the distance between Western intellectual culture and the internal culture of fundamentalist groups, flexibility is required on the part of researchers. I suppose we could wait for fundamentalist believers to become more flexible, open, and “reasonable,” but what we logic-bound Westerners perceive as unreasonableness in, for example, Muslim fundamentalist believers, is part of what defines them (at least to us) as fundamentalists. Though it is important to understand the objective aspects of religious behavior, this is not enough when it comes to fundamentalism research. It is largely the elements of religion that are *not* amenable to objective, quantified study (such as spiritual experience and conviction) that need most to be studied and understood. The visceral correlates or descriptive statistics associated with fundamentalism contribute valuable data, but these kinds of data do not have the potential to help build a dialogical and mutually respectful bridge between “us” and “them.”

Epistemological Flexibility as a Dialogical Bridge

The third and final point I have alluded to is that the dialogical engagement needed to bridge epistemologies is also needed to surmount the walls that separate fundamentalist believers from the scholars who study them. The epistemological divide between researchers and fundamentalists consists in the fact that fundamentalists do not fit within the predominant worldview of Western academia. Similarly, the values and purposes of Western academia do not fit within the worldview of religious fundamentalists. Western scholars are at a particular disadvantage when attempting to broaden their epistemological sensibilities. Because the West, and especially the U.S., is seen as the main source of pain and trouble by many Islamic fundamentalists, American researchers can easily become defensive, even subconsciously, at being blamed for the very phenomenon they are studying. Intellectual and epistemological rigidity, not flexibility, tends to result from a defensive posture. So rather than walking onto a level playing field, Western researchers, epistemologically speaking, are staring out at a disadvantage.

When scholars acknowledge personal barriers to the epistemological flexibility I am calling for, the possibility of engaging the frame of reference of the fundamentalist presents itself. More informed and effective methodological approaches to fundamentalism research would likely follow from this sort of epistemological transformation. Dialogical encounters with the lifeworlds of fundamentalist believers require an epistemological flexibility on the part of researchers that forsakes the assumed transcendence of positivism, scientism, intellectualism, and the Orientalist caricature of Islamic fundamentalist believers that is the current stereotype held by most (even educated) Westerners.

Perhaps a practical example would be helpful. I am imagining two versions of a research study, conducted by culturally Western researchers, that seeks to examine and better understand some particular aspect of the experience of Islamic fundamentalist believers. In the first version, a traditional quantitative study built on positivist epistemology would collect data or use data already collected, analyze the data according to the guidelines of the scientific method, disseminate the results to the rest of the scholarly community, and rest in having made some contribution to our "knowledge" of the phenomenon. There would be no attempt to validate the results against the lived experience of the research subjects because positivist epistemology, supported by the scientistic self-understanding of the sciences, is able to reassure itself that "truth" lies within the confines of the theory of knowledge it has created.

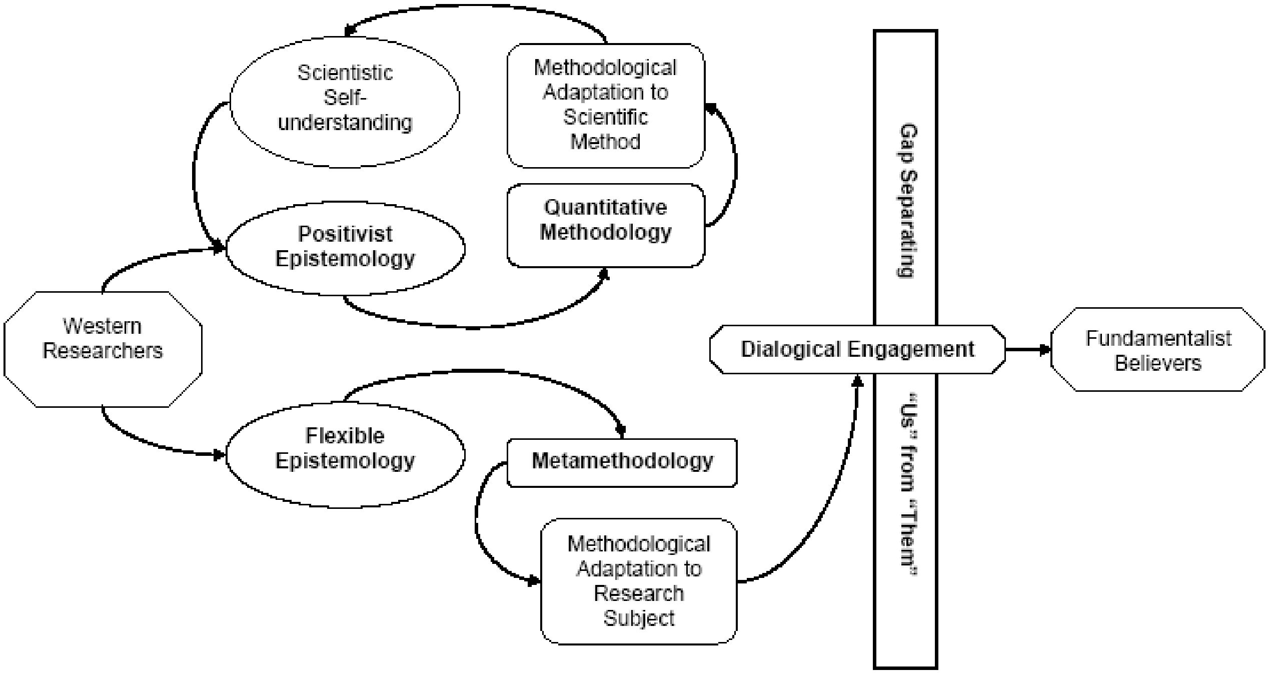
Continuing with our example, the second version of the study would employ metamethodology, be based on flexible epistemology, and would also seek to examine and better understand some particular aspect of the experience of Islamic fundamentalist believers. This set of researchers would begin with the perspective of the phenomenon that is held by the fundamentalist believers themselves, work backwards from there to establish the most appropriate set of methodologies, and then backwards again to the epistemological foundations needed to support and inform the selected methodologies. The attained results would then be presented to the research subjects as a topic of discussion in order to ascertain how they compare with the subjective lifeworlds of those being studied. This dialogical encounter between researcher and researched is partially made possible by the fact that the study has been based on and consonant with the values and sensibilities of the research subjects from the beginning. Because the epistemological set of the researchers has been calibrated based on the methodologies suited to the phenomenon under study, a bridge of common language and ideas is already potentially at hand. This increases the likelihood that dialogue between researchers and researched will be characterized by sameness of purpose, by a more accurate understanding of the lifeworlds of religious fundamentalists, and by a sense among those being studied that Westerners are making an honest, concerted, and sincere effort to understand them and to help explain them and their position to other Westerners. This dialogical engagement is, in my opinion, the only way the "problem" of fundamentalism (as many Westerners think of it) will be effectively addressed.

Almond, et al. (2007) describe how some fundamentalists have a different perception of time, history, meaning and the future than most other people. How can non-initiates understand the experience of initiates if that understanding is based on a divergent perception of time, history and meaning? Refining and adjusting our epistemology to meet the needs of the group being studied is the first step toward the "dialogical hermeneutic" advocated by Zaidi (2007) . When we expect the subjects of our study to conform to our worldview, we build a wall of misunderstanding between them and us that cannot be scaled by even the most astute methodology. Without an appreciative epistemology that includes the worldview of those we are studying, we may literally be "talking to ourselves" in that the data and insights we collect and publish have no meaning for anyone outside our small circle of like-minded intellectuals.

Metamethodological consideration of religious fundamentalism can only take place in an atmosphere that is epistemologically flexible and metatheoretical. Because each methodology brings with it the epistemic baggage of its founders and defenders, metamethodological insight requires an appreciative and inclusive, as opposed to rigid and essentialising, approach to research. Coming at the topic of religious fundamentalism from a number of different angles at once helps us to see that metatheoretical knowledge of religious fundamentalism must include some element of the contributions of each part of the whole: empirical and hermeneutic, quantitative and qualitative, Western and Eastern, secular and religious, believing and non-believing, theoretical and practical. It is the synergy of metatheory that is exciting, and it is the epistemological clarification and bridging engendered by metamethodological thinking about religious fundamentalism that holds some promise for improved dialogical interchange between two sides of an issue who appear, on the surface, to have nothing in common.

Conclusion

The basic argument of this paper can be summarized in two statements, one existential and one theoretical. First, my existential offering: The only way the "problem" of religious fundamentalism is going to be "solved," especially the violent and militant type, is if the people to whom the ire of radicalized believers is directed (Westerners) do a better job of understanding, reaching out, communicating, responding and otherwise attempting to bridge the span that divides "us" from "them." Second, I offer a theoretical model, which is complemented by a graphic representation (Figure 1). Beginning at the left of the diagram and working toward the right, researchers embark on the task of religious fundamentalism research with either an exclusive preference for positivist epistemology or with some measure of epistemological flexibility. Studies in the first category utilize quantitative methodology and are adapted to the tenets of the scientific method. Scientistic self-understanding completes the loop which keeps these studies and their authors from penetrating the gap that exists between two very different cultures, epistemologies, and value systems (i.e., between Western researchers and religious fundamentalists).



Scientistic Self-understanding
Methodological Adaptation to Scientific Method
Positivist Epistemology
Quantitative Methodology
Western Researchers
Flexible Epistemology
Metamethodology
Methodological Adaptation to Research Subject
Gap Separating "Us" from "Them"
Dialogical Engagement
Fundamentalist Believers

Figure 1. Dialogical engagement as a function of epistemological flexibility and metamethodology.

Starting again at the left of the graphic and following the bottom track to the right, studies based on flexible epistemology are positioned to adopt metamethodology. Because metamethodology has the ability to adapt itself to the needs of the research subject(s), the chance of dialogical engagement between researchers and researched is optimized. Dialogical engagement is the bridge that has the potential to span the gap that separates "us" Western researchers from "them" fundamentalist believers.

This is only one way of conceptualizing these issues and what road we might take to address them more fruitfully. It is also true that this argument is based partly on my own value system. Again, a theory or a model is only helpful to the extent that it assists us in making a sticky or intractable problem clearer and more solvable. My hope is that these ideas, when combined with the ideas and contributions of other scholars, will move us a step toward mutual understanding.

If the issues that create and sustain the radicalization of religious fundamentalists are to be more fruitfully addressed, a bottom up change in how we think about and try to "solve" those issues is needed. This change will look different depending on the context (political, religious, social, academic, etc.), and the current effort relates to scholarly endeavors and the philosophies and theories that support them. In the scholarly context, wholesale restructuring begins with epistemology, because intellectual pursuit is about "knowing" things. Barriers that exist at the epistemological level must be exposed and worked around. Research methodology, which emanates from and is supported by epistemology, must attune itself to the phenomena being studied. Metatheoretical constructions formulated in an environment of epistemological flexibility and metamethodology predispose the scholarly project toward appreciation, engagement, openness and dialogue and away from isolation and insularity.

Strategy as Metatheory

Alan E. Singer[1]

Abstract: Business strategy or strategic management is a subject that has comprised a major part of the curriculum in business schools around the World for at least 40 years. It is routinely described as "integrative," yet has arguably remained somewhat limited in its scope and philosophy. The purpose of this paper is to expand the scope of strategic management accordingly (to include ethics for example) but to do this in a way that arguably offers efficient insights to students and practitioners. The approach involves bringing together several formal metatheories while at the same time indicating how each of them can function as an integrative theory of strategy.

Keywords: Ethics, metatheory, modeling, optimality, rationality, strategy.

Introduction

Business strategy or strategic management is a subject that has comprised a major part of the curriculum in business schools around the World for at least 40 years. It is routinely described as "integrative," yet has arguably remained somewhat limited in its scope and philosophy (cf., Burrell, 1989; Calori, 1999). The purpose of this paper is to expand the scope of strategic management accordingly (to include ethics for example) but to do this in a way that arguably offers efficient insights to students and practitioners. The approach involves bringing together several formal metatheories while at the same time indicating how each of them can function as an integrative theory of strategy.

In this paper the term "metatheory" refers to any general theory that elaborates upon a core behavioural construct or theme. For example, the term metarationality refers to a general theory that recognizes many distinctive definitions of rationality. Such themes transcend and thus potentially inter-relate the traditional disciplines that are usually associated with strategy. They include: ethics (ethicality), optimality, modeling, forecasting, recursivity and synergy. Each such metatheory is well-documented and can be succinctly reviewed by deploying a mixture of conceptual frameworks, natural language descriptions and mathematical formalisms. The central points of the present paper are that (a) each metatheory can be placed relative to strategy, in an appropriately expanded conceptual space, or epistemological landscape; and (b) these "placements" seem to inform strategic management in an efficient and effective way, even

though they do not necessitate a mastery of each of the traditional academic disciplines with which they are each associated (e.g., moral philosophy, economics, ecology, sociology and psychology, management science and the cognitive sciences).

It is therefore an implicit suggestion throughout the paper that we might think of the metatheories as teachable content in business schools that potentially offers efficient insights (i.e., maximum understanding for minimum effort) as well as a degree of wisdom, to students and management practitioners. In contrast, the *status quo* in the study of strategic management involves a selection of historically determined discipline-based theories, large parts of which have only a remote bearing upon well-informed economic action. In other words, the set of metatheories can be thought of as a powerful and adaptable toolkit for the managerial mind.

Rationality & Metarationality

Rationality has well over 40 distinctive forms (cf., Singer, 1996, pp. 20-23; 2007, pp. 53-56), each of which has been explicitly defined within the spectrum of the social sciences and philosophy. These can be described as the elements of a rationality *set* that can, in turn, be placed in correspondence with core concepts in the domain of strategic management (i.e., a strategy-set). Metarational arguments then provide an integrative and high-level theory of strategy that in turn maps out its some of the *terra-incognita* and indicates directions for development. A general theory of rationality that maps out the structure of the rationality-set is like an interwoven fabric, as it involves not only the identification of multiple forms of rationality (elements of the rationality-set R**)**, but also the specification or construction of :

1. C*lassificatory* metarational criteria for classifying the elements (e.g., calculated vs. systemic forms; belief, means, ends-oriented forms, backward-looking forms, etc.).
2. *Evaluative* metarational criteria (e.g., universalizability, globality, level of self-support, etc.).
3. R*elational* metarational arguments that place elements and subsets of the rationality-set in relation to each other (e.g., utility-capture, relations between beliefs and ends, etc.).

Within the general theory, a distinction has been drawn between calculated versus systemic forms of means-rationality, then between other means-rationalities, belief-rationalities and ends-rationalities. It then becomes possible to identify direct linkages to, or correspondences with, almost every topic within strategic management. These correspondences between rationality concepts and strategy concepts can be made explicit, as follows:

1. Belief-rationalities ~ managerial-perspectives and expectations.
2. Means -rationalities ~ strategic decision processes.
3. Action rationalities ~ logical incrementalism.
4. Backward-looking rationalities ~ historical processes and learning.[2]
5. Interactive rationality ~ predicting or diagnosing strategy.

---

[2] Another example is the strategy concept of "planning as learning" (De Geus, 1988) which corresponds with backward-looking or retrospective forms of rationality, whose definitions contain explicit reference to past events, such as "thorough learning from past mistakes."

6. Ends -rationalities ~ corporate objectives and missions.
7. Rational-morality ~ managerial ethics.

A relational structure can then be implanted in the rationality-set **R** (and hence also in **S**, the strategy-set) using two types of metarational relationship:

1. rI is a form of rJ . For example, sympathy . . . is a form of . . . extended-ends-rationality.
2. rI has significant common properties with rJ , for example, expressive rationality (which involves communicative action like signaling) . . . has significant common properties with strategic-belief rationality (which is concerned with game-theoretic interdependencies).

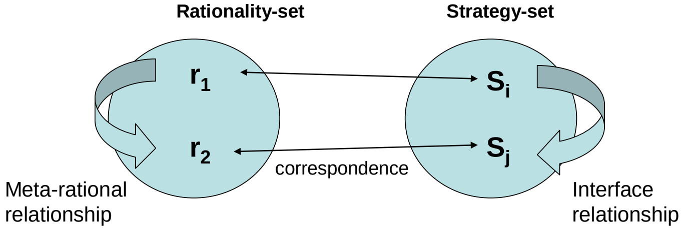

Figure 1. The concept of an isomorphism between a strategy set and a rationality set

The relational structure in S is similar, and it is preserved (or in some cases identified, or implanted or transcluded) by assuming that the one-to-one correspondence between R and S is a structure-preserving mapping, or isomorphism. In that case, corresponding to 1 and 2 in R, we have relationships between the images 1* and 2*, as follows:

1* Stakeholders-as-constraints…is a form of…organizational goal system.
2* Positioning is an ingredient of organizational strategy. This strategy-concept…has significant common properties with…signaling behaviour.

More generally, this is to say that every form of rationality has its corresponding strategy-concept, whilst strategy interface concepts reflect the corresponding metarational relationships. The central tenet of “strategy as rationality” is that this statement provides a succinct (but somewhat fierce) summary of many lengthy academic articles on strategic management.[3]

The overall conceptual framework of an isomorphism between a rationality-set and a strategy-set can be represented diagrammatically (Figure 1.) but it can also be expressed in a *quasi*-formal way, as follows (non-mathematical readers might skip the remainder of this paragraph). Let $(r_I\ r_J)$ be any pairwise relationship in Rx R that is, a metarational relationship like those described above. The mapping $I: R \rightarrow S$ gives $I\ (r_I\ ) = s_k$ and $I\ (r_J) = s_l$ for some k, l. Then, for all i, j, we have: $I \times I\ (r_I\ ,\ r_J\ ) = [I\ (r_I)\ ,\ I\ (r_J)\ ] = (s_k\ ,\ s_l)$, for some k, l, where the latter pairwise relationship in S is an *interface* relationship between a pair of strategy concepts.

---

[3] A current reviewer identified the axiological framework (value-orientation) of “strategy as rationality” as “post-postmodern integrative normativism.” It might also be regarded as *pre*-post modern, that is, fitting between neo-classical type formalisms and postmodern narratives. An early review by Geoffrey Hodgson suggested linkages with the Classical Pragmatic tradition (cf., Singer, 2009a & b).

The mapping I is an isomorphism in the mathematical sense; that is, a structure-preserving map that identifies the two sets, **R** and **S** as essentially equivalent, even the same thing. An **R ~ S** isomorphism specified in this way effectively states that the concepts of strategic-management and plural-rationality are co-extensive, meaning that the language and underlying concepts of these two sets (or domains of knowledge) parallel one another. Accordingly, one can make the claim that it not only makes sense to view "strategy as rationality," but that it also make good sense to assert that "strategy *is* rationality" and vice versa. This equivalence or sameness is no coincidence. It may explained by the simple observation that both sets (R and S) have been produced as a result of attempts by scholars and practitioners to grapple with quite general problems in human systems. These involve action and decision, behavior and exchange, production and communication. Put differently, there is no single valid theory of strategic decision-making (or decision-taking), there is only a metatheory of decisions

Ethics & Metaethics

A similar approach can also be used to equate or identify strategy with ethics, via metaethical arguments (e.g., Van Gigch, 1991). It is at this level of inquiry and language use that we encounter the many incomplete arguments or formal paradoxes and contradictions that convey the difficulty of reconciling utility/profit based approaches with alternatives that involve expressive, Kantian, reflective and other forms of rational-morality. Accordingly, the conceptual framework of "Strategy-as-Rationality" extends to "strategy as moral philosophy" (e.g., Singer, 1994) in which plural rationalities, metarationality and metaethics become recast as a general normative theory of the strategy of productive entities.

Some forms of rationality may be captured by arguments that identify them, for at least some purposes, as special cases of Rational Utility Maximization (RUM), that is, the rank-ordering of, and selection from a set of objects-of-choice (including possible actions), according to formal preferences. Sen's *sympathy* (preference incorporating others' interests) or Etzioni's *interdependent* utility (as in game theory and other studies of joint-optimization) are partly captured in this sense, as is bounded rationality after allowing for the costs of information and computation. RUM thus becomes an umbrella-term covering a subset of the rationality-set, or more accurately a fuzzy-subset whose membership is by degrees. The degree of membership in this fuzzy set is a matter to be settled through metarational arguments, often in natural language, that vary in their level of persuasiveness and coherence. Other elements of the rationality set are more elusive, or hard to capture. Examples include commitments (altruism), expressive rationality, and contextual forms. Within the present framework, the existence of these *elusive* forms implies that strategy should/ought to involve occasional (corporate) self-sacrifice; expression of (corporate) values; or the creation and maintenance of institutions and (corporate) traditions, in a way that cannot be entirely subsumed into profit- maximization.

Any given strategy concept may thus be evaluated and placed relative to others with reference to metaethical criteria (i.e., criteria for choosing rationalities and forms of ethical reasoning). The concepts of (a) capture (above) and (b) scope are salient examples of such criteria. Several concise metacriteria can be used to evaluate the "scope" of any given form of rationality or ethic, as follows:

Global versus Local Optimality. A globally-optimizing form maximizes total lifetime utility for the agent, after taking into account the impact of current decisions on the agent's own future preferences, learning, habit-formation and co-ordination with others (resolute-rationality is global, narrow-egoism is local, in this sense).

Universalizable versus Exclusive. A universalizable form is one that the agent prefers other agents to adopt (Kantian rationality is universalizable by definition, self-interest modeled as RUM is not, as made quite explicit in Prisoners' Dilemma games).

Self-Supporting versus Self-Defeating. A self-supporting form hypothetically chooses itself when used to select a form (cf., recursivity, below). While Kantian and commitment forms are self-supporting in this sense, formal-RUM can be self-defeating as also demonstrated in the Prisoners' Dilemma game context.

Collectively, these and other metacriteria (perfect-imperfect; precision-of-definition, etc.) characterize the prescriptive gap that currently separates the rationality assumptions of the mainstream (i.e., economic) theory of strategy from (business) ethics. Put differently, while the axioms of economics undoubtedly have powerful normative appeal, so also do the various metacriteria that *RUM* fails to meet fully. With the isomorphism in place, the metacriteria can be used directly as tools to evaluate the corresponding business strategy concepts.

Optimality & Metaoptimality

Over 40 years ago, C. West Churchman, a famous Berkeley systems-scientist, ethicist and management theorist declared (1994, p. 108) that "we do not know the meaning of optimum."[4] Since then it has indeed become increasingly apparent that optimality is "a far more profound and elusive state of affairs than can be derived from the most powerful of mathematical proofs" (Mason, 1994, p. 70) and that there are many definitions of optimality. In sum, different conceptual definitions of optimality have developed over time and there are many distinctive forms. As with rationality and ethics, some forms can be stated mathematically (e.g., Zeleny, 1996) while others require natural language statements to complete their definition. The same is also true of strategy; yet this is no coincidence. Optimality, "broadly defined" can be invoked as an organising principle in order to restructure and augment current thinking in the latter discipline. The converse is also possible, because empirical research in strategic management can potentially stimulate and refine ideas about the possible meanings of optimality.

As with the plural rationalities, the several forms of optimality correspond with strategy concepts, as listed in Table 1. These fall into two broad classes, under the metaoptimality criterion of elusiveness *vs*. capture. The captured forms are implicit in several traditional paradigms and they accordingly underpin the idea of an Economically Optimal Strategy (EOS).

---

[4] This might mean (a) we do not have a single definitive operational definition of optimum, so there are many distinctive forms of optimality (e.g., Zeleny, 1996). It might also mean that (b) we don't know what is really the ideal human system, the best way of living with others, so we cannot be sure of the merits of any of our actions. As one reviewer put it, "the search for optimality is always relative, never absolute"

A second class, the Systemic-Ethical Optimum (SEO) with its corresponding strategy concepts, includes the elusive (non-maximising) forms (cf., Singer, 2007).

Table 1. Optimality and Strategy

Form of Optimality	Strategy Concept
Maximisation	Finance-theoretic decision models
Cybernetic	Mgmt. by objectives, or exception
Evolutionary	Environmental fit & adaptation
Inherent	Org. dynamics & dissipative structure
Optimal design	Management without tradeoffs
Multi-criteria	Stakeholder model & multiple objectives
Systemic	Plural rationality & embeddedness
Ethical	Co-production of human-goods

As a practical matter one can then ask which class of "optimal strategy" is better? Attempts to answer this question require the invocation of metaoptimality criteria, such as (a) the proper scope of optimality formulations (i.e., optimal for which entities) (b) the reducibility or otherwise of goodness to betterness, and (c) the overall relationship between facts and values. Given the high level of ambiguity, contentiousness and incompleteness at this metalevel it is inevitable that strategic business decisions are often experienced in practice as "wicked messes." Currently, the idea and ideology of EOS undoubtedly prevails, yet systemic perspectives are also evident. It seems that a more inclusive perspective[5] is now appropriate, reflecting SEO *and* EOS. Such complementarities and possible synthesis at this level stands to expand the boundaries of conventional strategic thinking.

Models & Metamodels

The analysis and development of firms' strategies in practice is almost always carried out (pragmatically) with reference to diagrams, conceptual models and their surrounding narratives. Some of these are off-the-(library)-shelf and often appear to be offered in the spirit of one model fits all, while others are custom built by managers or consultants for a particular situation. These models can be reified and themselves depicted and described in a variety of ways (Table 1). For example, any conceptual model can be described as a set of images and expressions that depict and describe aspects of reality. More generally, a "conceptual metamodel" is therefore:

A CONCEPTUAL-MODEL OF (a conceptual-model of (aspects of reality)).

---

[5] Some strategy concepts embody subsets of these forms. For example, as a reviewer noted, the evolutionary, systemic, ethical and design forms all appear to be embodied within an "eco-centric strategic business orientation" known as Biomimicry or Biomimetics.

That is, a set of images and natural language expressions, or patterns, or discourses, that describe and depict "conceptual models" of themselves. The relevant expressions then include terms such as comparison, design, transition, renewal, influence and replication (Table 2). In the "comparison" metamodel (Table 2), for example, a conceptual model is described as an object-of-choice within a static decision problem (Table 2 column 2). Some of the better-known conceptual models of strategic behavior (strategic management) involve competitive strategy, hyper-competition, stakeholder management, etc. An inquiring strategist (or metamodeler) might seek the richest possible description of these "objects." Accordingly, features are identified, classified, and contrasted, as in a taxonomical approach.

Table 2. Metamodels

Metamodel	Depiction of CM	Role of Inquirer
Comparison	Object-of-choice	Analyser
Design	Trigger	Designer
Transition	End-state	Learner
Renewal	Trigger	Self-producer
Influence	Instrument	Political entity
Replication	Meme	Host

A conceptual model can also be depicted as a *trigger* of a process of design (an "instigating causality" in von Bertalanffy's terminology). The tension between a new model and prior understandings motivates an inquirer (e.g., strategist) to find a resolution. For example the competitive strategy model can be combined in a single figure with the stakeholder model, despite the evident underlying tension between them.

Design

The transition metamodel (Table 2, row 3) involves a process of accommodation (creation of a new cognitive schema). For example, a simple input/output model of the firm can be transformed by incremental steps into a more complex stakeholder model. The competitive strategy/ advantage model can be transformed into the hyper-competition model. Here, features or elements of the first model, such as the existence of industries with weak forces are replaced with new elements, such as escalation of incumbent rivalry and multiple competitive "arenas." This "transition metamodel" is very effectively communicated in a non-strategy context in the lithograph *Liberation* by the artist/designer Escher, in 1955, which shows a row of triangles transform, by barely perceptible steps, into birds in flight.

Transition

A conceptual model can also trigger a process of inner-directed change, or psychological renewal of the individual who interprets or constructs the model. Exploration of core values and rationalities implicit in the model can result in individual and collective self-renewal. Psychologists have called this type of process “deep self referral” and have associated it with increased confidence and performance, making the individual more competitive (but not because of the explicit content of the conceptual model *per se*). For example, a person who reflects upon a model in which the category “trust” features prominently, might not only change their policy, but also refresh and renew themselves.

Influence

Models can also be deployed for political purposes. A person in a position of power (a manager) draws attention to a particular model, with the covert intention of influencing other's behavior. The models might be used to try to inculcate a culture, to create a team of like-minded players, or to direct attention away from (or towards) wider stakeholder concerns. People (e.g., subordinates, voters, etc.) thereby adopt a given model out of deference to power, which opposes or displaces the type of self-referral described above (see the later section on “pragmatism and power”). As Sennett (1998) put it, it can lead to a loss of identity, or the colonization of the self.

Replication

Finally, conceptual models can themselves be depicted as productive entities that co-produce many copies of themselves. Here, models are seen as distinctive abstract patterns that compete for share of mind. The “replication” metamodel is consistent with Foucault's description of “competing discourses” that he says characterize contemporary (post-modern) life; but perhaps it finds its sharpest expression in the idea of a model as a *meme*, or a chunk of information that lodges in brains or minds. The role of the model in an ecology of knowledge is then analogous to that of genes in biological systems. Every time an entity (e.g., an individual or a collectivity) attends to a meme (i.e., a model) a replication occurs. Yet, as suggested earlier, an entity that hosts any particular meme or model is not necessarily advantaged. The effect can also be neutral or destructive.

Strategy

Another revealing correspondence (or equivalence) exists between this metalevel perspective on modeling and an object-level perspective on strategy itself. For example, the replication metamodel implies that entity cannot freely choose a conceptual model, instead the model (a *meme*) is reproduced through cultural and behavioural processes such as imitation. A similar evolutionary model of “strategy” (at the object level) sees that a firm “cannot freely choose” its strategy. Questions of timing also recur at these two seemingly-separated levels of analysis: one can always question the timing of a strategic move, but equally the timing of any transition from one model to another.

This “correspondence” between strategy and metamodel can also be made more explicit (Table 3). Having identified the set of “metamodels” (comparison, transition, design, etc.) we can point to many corresponding concepts within strategy (e.g., strategy-selection, change-management, generation of strategic options, etc.). It is thus evident that the elementary categories of meaning that apply to the “real” (object-level) world of strategic management all re-emerge during any sustained process of inquiry at the metalevel, where they can be applied to abstract conceptual models themselves.

Table 3. Metamodels and strategy concepts

Metamodel	Strategy Concept
Comparison	Strategic choice, selection
Design	Generate options, overcome tradeoffs
Transition	Management of change
Renewal	Develop Competencies
Influence	Incrementalism, symbolism
Replication	Emergent strategy

This type of recursive re-generation of a concepts is not only characteristic of metatheory and inquiry, it is also strikingly evocative of a phenomenon in Chaos Theory (dynamical systems theory) whereby essentially the same fractal patterns re-appear, with just slight changes, as one drills down ever further into the "edge of chaos;" for example the boundary of the Mandelbrot set. As this is done, using visual computer models, this boundary reveals the so-called baby-Mandelbrot sets that come into view successively and infinitely many times, as resolution continually increases. Put differently, sustained inquiry that moves beyond traditional disciplines and categories ultimately seems to generate something like the patterns found in nature.

Recursivity & Ecology

Recursivity and self-reference are found in many arguments and lines of inquiry that attempt to bring together of once-separated levels of description and representation, as in the above example of strategy and metamodels. This general abstract notion was first developed in Ancient Greece (cf., Hofstadter, 1979) where it found expression as Epimenides' paradox: "this sentence is false." More than 2000 years later, the notion was re-formulated in metamathematical terms as Russell's paradox: If we write "the set of all sets that are not members of themselves," the proposition that "this set contains itself" quickly yields in the mind the idea that it does not. To resolve this paradox, a more elaborate Theory of Types was duly designed (in *Principia Mathematica*) that made an explicit distinction between signs (e.g., sentences, conceptual models) and their referents or semantics (this being a central theme in the field of Semiotics).

The link between recursivity and *ecologica*l systems becomes more apparent when Russell's paradox is restated as a riddle involving self-production (i.e., Maturana & Varela's (1972) concept of auto-poiesis), as follows: "In a certain village, there is a barber who only shaves the men who do not shave themselves. Who shaves the barber?" Here, the proposition that the barber shaves himself quickly yields its opposite; but this time the paradox is not so abstract: it concerns a physical entity that is producing a slight variant of itself (i.e., the shaved barber). In this way, something that initially expressed a purely abstract idea of self-reference becomes transformed, by a small step, into a description of self-replication in the natural world. This particular transformation was explored in detail by Hofstadter (1979, p. 535), who compared several mechanisms that create self-reference with mechanisms that self-replicate and uncovered "many remarkable and beautiful parallels."

Meanwhile, strategic management narratives have often referred to the idea that conceptual models and frameworks (like competitive strategy, stakeholder models, etc.) all compete for share of mind, in much the same the way that other intangible products such as websites do. It is perhaps less obvious that the models themselves might behave rather like the very entities (i.e., knowledge-producing firms) to which they refer. The full implications of this type of competition and self-reference, within an ecology of knowledge, has not been entirely worked through in business and economic theories. It has certainly been recognized that knowledge products act as (co-) producers (e.g., Ackoff, 1981; Evans & Wurster, 2000) and that this forces business entities in practice to "deconstruct" (i.e., to dismantle or re-configure) their business processes. Yet, at the same time, managers' conceptual models of strategy also compete and co-produce, perhaps implying that they too must be periodically disrupted.

Despite the implied self-reference, theories based upon value-creating exchanges and mechanisms still remain at the core of business and economic thought. Marketing, for example, still describes itself officially as "the science of exchanges" while the modern theory of finance is constructed around the notion of equilibrium in market-based systems. While these ideas of exchange and mechanism remain at the foundation of much business theory and the engineering view of economics, they are slowly being joined (not necessarily displaced) by the equally elemental, foundational and ecological ideas of self-reference and self-replication. Put more technically, the formal *preference*-relations that lie at the base of the Neo-classical paradigm are being augmented by formal *recursive* relations in models of business strategy. The latter are much more closely associated with living systems and the kind of chaotic dynamic systems that generate the emergent patterns of "syntropy" found in nature.

Synergy & Dialectics

In addition to the many conceptual models within business strategy, several authors and consultants have advocated variants of dialectical reasoning in the strategy formulation process. Over 30 years ago, for example, Mason (1969) proposed a dialectical-inquiry method of policy formulation and since then others have advocated various forms of trinetarian thinking (thesis, antithesis, synthesis; triple-bottom line reporting, etc.) but often without explicitly mentioning the dialectic, as such. There are also numerous conceptual frameworks and philosophical (qualitative) discourses that involve oppositions or tradeoffs, together with some kind of designed synthesis (Table 4). For example, the notion of moral imagination (in philosophy and business-ethics) involves devising new ways of including others (e.g., the poor) in the business strategy discourse, thereby widening moral boundaries and the scope of justice. In the organizational behavior tradition, similar practices such as stakeholder learning dialogues and generative discourses have been advocated.

In systems theories, the multi-capital conceptual framework (arguably, yet another metatheory having "capital" as its central construct) depicts a set of forms of capital, including financial, ecological, human, social, cultural, political and moral "forms." These are almost always described as being highly inter-related, not fully commensurable (reducible to one overarching measure) and as forms that should be accumulated at the same time, with a view to achieving synergies. A rather similar prescription for synergy-seeking can also be derived from the general theory of rationality described earlier. A hyper-rational industrial system, in the sociological sense of the term (Ritzer & LeMoyne, 1991) is one that continually designs new patterns and structures that express and foster a synthesis of distinctive forms of rationality. Ritzer & LeMoyne confine their account of this idea to the Weberian forms (formal, practical, theoretical, substantive) and to entire industrial systems, but their core idea of hyper-rationality (i.e., synergy amongst forms) can easily be generalized and extended to include Kantian and expressive forms, and so on. A hyper-rational entity thus attempts to design ways of adding to income, identity and justice (deliberative rationality) all at the same time, but in a way that also seeks and achieves synergies. The general theory of optimality also offers some recognizably similar types of prescription, particularly in its concept of optimal design as formalized in *de novo* programming (e.g., Zeleny, 1996).

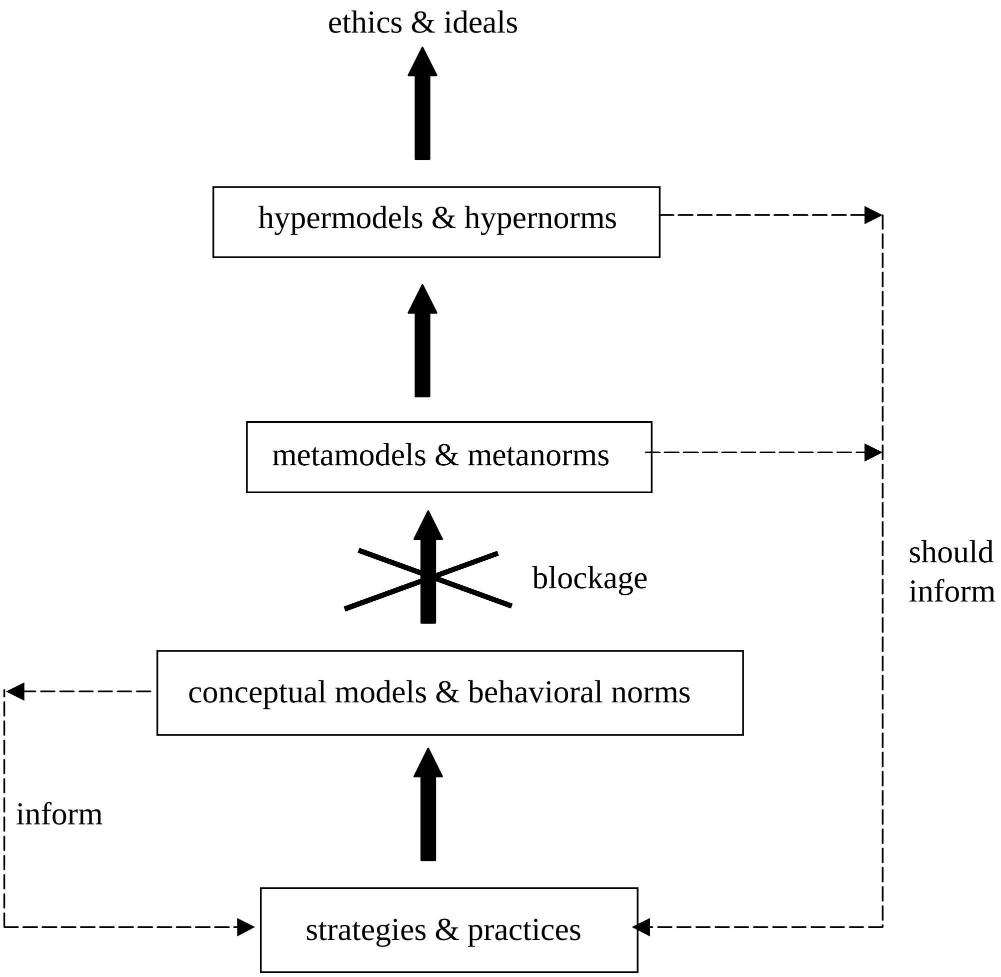
Table 4. Synergy elements within the metatheories

Metatheory or Theme	**Some Components & Forms**	**Synergy Element**	**Implication for Strategy**
Rationality	Utility-max, Expressive, Weberian	Hyper-Rationality	Compete through synthesis
Ethics	Deliberative, Kantian,	Moral-imagination, Pluralism	Combine forms
Optimality	Maximisation, Ethical, Dynamic, etc.	Optimal design	Co-produce human goods
Modeling	Dialectical Inquiry, Generative Discourse	Synthesis	Forge stakeholder-synthesis
Multi-capital	Economic, Human, Social, Ecological	Synergetic design	Accumulate all forms

All these frameworks (Table 4) involve some aspects of dialectical thinking. A single concept, such as financial capital formation, income-poverty reduction, or utility maximization, is expanded into a wider view, involving multiple forms. Then, the relationships, or *meta*relations, become the focus of attention and theory development. Finally, some form of synthesis is proposed, especially synergy-seeking (e.g., hyper-rationality, optimal–design, generative discourse, etc.). This last step can be thought of as embodying an important quality of the human spirit: that is, creatively overcoming tensions and oppositions involving self and others in various contexts (e.g., Basseches, 2005). This, in turn, is one of many dualistic elements of strategy, in which the search for synthesis and synergy has been linked to the wider quest for high performance (e.g., De Witt & Meyer, 2005).

Metatheories & Practice

Over 20 years ago, the works of Argyris (1982) and Schon (1983) on the reflective practitioner and double-loop learning drew attention to the role of managers' mental models in the determination of business strategy and performance. They reported that the mental pathway from a model to a metamodel, or from a norm to a metanorm was often blocked in practice (Figure 2). This was taken to indicate a need for cognitive therapies (implying that some given models might be dysfunctional, or "sick," as one reviewer put it) or socio-political interventions. Such "therapies" might then be structured around the explicit metatheories mentioned in this article, whilst a complementary "political" approach (see next section) involves cultivating or fostering metanorms, such as "It's OK to challenge norms," as well as hypernorms that challenge or refine the metanorms.



ethics & ideals

Pragmatism & Power

All such hierarchies of reflective thinking linked to practice (including Argyris' triple-loop learning) lead quickly to considerations of what, if anything, exists at the pinnacle? What is the culmination of all this reflection? This might be the “ultimate meaning” mentioned at the outset, or perhaps as John Dewey once put it (and as a reviewer suggested) it is “the unity of all ideas and ends arousing us to desire and action.” Previous attempts to answer this question have considered processes, or how to get towards the top, as well as contents, or what you might find when you arrive. The latter approach dates back at least to Plato, who specified a set of human goods including justice, health, wealth and friendship. This idea of good as something more than individual preferences or desires has persisted in various forms, including notions of hyper-goods and hyper-norms. The latter are implicit social contracts or cross-cultural agreements about “fundamental conceptions of the right and the good” and they constitute yet another contemporary linkage between strategy and ethics that fits well with the metatheories.

The idea alluded to throughout this article - that sustained human inquiry culminates in hypothetical ideals but also guides practical action - is central to the Classical American Pragmatism expressed in the works of John Dewey, William James and Charles Sanders Peirce. Although Dewey and James are often regarded as foundational figures in educational theory and psychology respectively, their works are often omitted or downplayed in contemporary curricula, even in these disciplines, not to mention business studies. Ironically, however, their pragmatic (and pluralist) philosophy has been making a strong comeback during the last decade of progress in management and economic theory (e.g., Margolis, 1998; McVea, 2008; Rosenthal & Buchholtz, 2000; Webb, 2007; and Wicks & Freeman, 1998; to mention a few). Classical pragmatism readily accommodates the type of pluralism that has been expressed and analysed in this paper so far. Not only are the various elements and metatheories presented as if they were useful and efficient guides to ongoing action, but such actions are to be predicated on multiple perspectives and a sense of mutuality encompassing a decision maker (or any strategic entity) and its environment; an idea that is at last becoming mainstream.

There is, however, yet another type of metatheory within Sociology, one that (a) extends the *political* process model of strategy (e.g., Allison, 1971) as contrasted with the rational (or metarational) processes discussed so far; and (b) builds on the idea first developed by Burrell & Morgan (1979) of classifying sociological paradigms. Two decades later, Alvesson & Deetz (1998) set out a “metatheory of representative practices” in which four types of knowledge (rather than forms of rationality or paradigms) were distinguished. These types depend upon the political contexts within which entire research programs develop; rather than any particular patterns or contents of reflective inquiry. The four distinctive types of knowledge-production practices were then placed relative to each other. The types are: the normative (e.g., economic theory), the critical (e.g., critical management theory), the dialogic (e.g., minority and radical voices in a global context) and the interpretive (i.e., local communal understandings). Accordingly the Alvesson & Deetz metatheory draws attention to several sources of knowledge that differ with respect to the level of political power of their source, rather than their cognitive salience or persuasive power. At the same time it appears to place the four types (and their sources) on an apparently equal footing. That is, the minority voices, the local knowledge, the distinctive community-wide understandings and the so-called “elite discourse” of scholars and experts, might in principle all be given equal prominence and legitimacy.

This metatheory of representative practices is in considerable tension with the pragmatic ideal and the forms of pluralism that have been expressed and advocated so far in this paper. It is perhaps aligned more closely with a contrasting philosophical position known as deep-pluralism (cf., Aitkin & Talisse, 2005) in which values (hence also some of the forms of rationality and ethics) are held to be incommensurable, or incapable of being adjudicated rationally. Deep pluralism implies that conflicts between values (or forms, or theories) must be settled through the exercise of power among the entities or "research communities" that uphold and express them; a position that, as one reviewer noted, "does not seem to add much;" but that more critically appears to point to the potential use of force, or at least to license it as an alternative to the kind of essentially dialogic and reflective notion of strategy considered previously.

Conclusion

In addition to relating theories to communities, as in the "representative practices" approach, we can also relate particular metatheories to source disciplines, such as sociology, economics, moral philosophy, management science and psychology. As mentioned at the outset, these traditional "disciplines" are supposed to be integrated in strategic management capstone courses in business schools (and in other interdisciplinary-studies programs). However, as every educator must surely be aware, all such attempts at the integration of entire disciplines suffer from a generic weakness, namely, that under contemporary cultural conditions there is little mastery of any of the disciplines, in the first place. Furthermore, even where a student is reasonably well grounded in one or two disciplines, these usually emphasize just a small subset of the "core" constructs, or elements of strategic behaviour that are to be found in any of the metatheories. This is not a new observation. For example, in a rather similar context Etzioni (1986) referred over 20 years ago to the "*mis*-education of economists" and by implication, of business students as well.[6]

Although it seems idealistic, if might be possible to teach metatheory directly to academically inclined students and practitioners. Perhaps the strongest case for this could be made in PhD programs, but programs that offer a cross-cutting focus on themes such as sustainability would also be a good fit. Certainly, a good awareness and understanding of all of the core themes: rationality, ethicality, optimality, synergy, dialectics, recursivity and power has often been considered the mark of a properly educated person, or generalist, or strategist. Business education has been notably lacking in this respect and the situation has long been unbalanced. Unfortunately, many have learned about exchange, property and ownership; yet they have never encountered ideas of ethics, recursivity and dialectics. At the level of practice, the potential of metatheory also remains untapped, due in part to the above-mentioned blockage on reflective thought amongst many of the practitioners who have been upheld as role-models or leaders; but also due to the narrow pecuniary motivations of many business students. Given the limits of human attention and the extent of institutional influence, a good case can now be made to propagate metatheory in the business curriculum while at the same time highlighting its direct link with well-informed reflective practice.

---

[6] Many commentators, including the Premier of China (in 2009 on CNN) Patricia Werhane and a current reviewer, have noted that it is common to refer to Adam Smith's *Wealth of Nations* whilst overlooking or ignoring his *Theory of Moral Sentiments*.

Toward a Science of Metatheory

Steven E. Wallis[1]

Abstract: In this article, I explore the field of metatheory with two goals. My first goal is to present a clear understanding of what metatheory "is" based on a collection of over twenty definitions of the term. My second goal is to present a preliminary investigation into how metatheory might be understood as a science. From that perspective, I present some strengths and weaknesses of our field and suggest steps to make metatheory more rigorous, more scientific, and so make more of a contribution to the larger community of the social sciences.

Keywords: Metatheory, science, social science, science of metatheory, theory.

Social Science – Flapping Around in Circles?

In the integral community, as with other fields of the social sciences, many authors have worked diligently to create effective metatheories. Wilber (2001) and Laszlo (2007), for example, have produced metatheories that are both interesting and popular. However, a storm of controversy surrounds such theories because the existing paradigm of the social sciences does not include effective conceptual tools for evaluating metatheory (or theory, for that matter). This is not the fault of the authors. Indeed, they should be lauded as brave explorers who are pushing the boundaries of human thought. The problem, and an important reason for the criticism of theory and metatheory, is that there is no generally recognized scientific framework by which we might judge them.

What is this thing called metatheory, and how might it be useful? This is a question that has been alternatively surfaced, ignored, considered, derided, and viewed with amazement around the world of the social sciences. Despite (or, perhaps, because of) these varied reactions, there has been little effort to create a coherent and comprehensive science of metatheory. The effort has not been made, perhaps because there appears to be no need for such an effort. Perhaps those in the social sciences are satisfied with their existing views of theory. More likely, the conceptual "building blocks" were not in place to support the creation of a new science.

---

[1] **Steve Wallis** is the Director of the Foundation for the Advancement of Social Theory, working under the auspices of the Institute for Social Innovation, at Fielding Graduate University, where he earned his doctorate in 2006. FAST recognizes that many global issues could be more easily resolved if we possessed more effective social theory. Therefore, FAST is dedicated to supporting the development of theory that is unarguably effective in practice. Through this process we are increasing the relevance of academia, realizing the dream of the social sciences, and moving toward sustainable optimization of the global system. http://projectFAST.org

As to the question of "need," we now face a seemingly endless array of local and global issues from psychology to policy. It is becoming increasingly clear that the challenge of those issues cannot be met with existing theory. That is at least one reason why we continue to develop new theory. Unless, of course, the bulk of academicians are insulated from these issues – which I think and hope is not the case! Because the development of more effective theory is so important, a critical question for the coming decade is, "How might we advance research and practice more rapidly to more effectively address the important issues of our time?"

The traditional approach of the social sciences is to apply expensive resources to the problem (time, money, researchers, facilities). This approach has generated thousands of theories and untold quantities of data. We have so many theories and so many data that it has become difficult to organize knowledge or resolve basic contentions within a field (N. D. Campbell, 2009).That befuddling excess of information can be traced to the origin of the social sciences. There, in an attempt to mimic the success of the physical sciences, social scientists were encouraged to seek objective facts through empirical research. A goal that has continued to the present day with calls for still more empirical research (e.g., Argyris, 2005).

What we seem to have overlooked is that a science, much like a bird, must have two strong wings if it is to fly. Empirical facts are understood in the light of a specific theory. And, theory can is built from a careful consideration of the facts. Indeed, theory and research are so intertwined that neither can exist without the other – and both are needed for a strong science. Theory and research are differentiable, but they are also inseparable – existing in a generative yin-yang relationship. While this is a generally accepted truism of science, the actual practice of science is rather different. Under the existing paradigm, a scholar presenting a research proposal is required to describe a specific and rigorous research methodology. However, that same scholar need present little or no justification for the theory. Indeed, some respected scholars have suggested that theory should be developed intuitively (Mintzberg, 2005).

There is the dichotomy that has hobbled the development of the social sciences. In contrast to the well-developed wing of research, the wing of theory is withered. We have made a habit of building and testing theory without a specific methodology, essentially relying on subjective intuition. As a result, we lack a solid metatheoretical perspective, we lack a rigorous and repeatable methodology for comparing research proposals on the basis of their theories (Dolan, 2007). We are left to consider the so-called facts of the situation without the benefit of a carefully developed and commonly understood context. This points to a vast gap in the literature; and, indeed, the science. Because theory and practice are (or should be) closely interrelated, the advancement as a science may be limited by the limitations of either. The science cannot advance without both.

Defining a science of metatheory is one important step. When that is done, scholars will be to seek and create theories that are more advanced – theories that can be tested according to the most rigorous and repeatable standards.

While much has been written on theory (for a good resource, see, for example, Van de Ven, 2007) the results do not seem to have enabled the success of the social sciences. Few of those methods require any degree of rigor. For example, the most commonly used claim of validity for a presented theory is parsimony, but even that simple indicator is typically misunderstood and misapplied (Meehl, 2002). Further, by way of a thought experiment, if more parsimony led to better theory, we might conclude that the smallest theory would be the best of all – a difficult conclusion indeed. Based on this understanding of the necessary interrelationship between theory and research, it is reasonable to expect that the development of rigorous methodologies for developing and testing theory and metatheory will bring balance to the social sciences. This, in turn will accelerate the advancement of that science and aid in resolving the issues that face our world.

In short, there exists in the social science, a silent prejudice. Unrecognized and unabated, it eats at the heart of our science, destroying its legitimacy and impeding its advance. To create a more effective social science, we must first develop more mature, and more scientific approaches to the study of metatheory. In this, I refer to science as a process of investigation, replication, communication and the emergence of new and useful meanings. Not, as some think, of science as a complete set of natural laws where meanings are fixed.

A parallel concern is the ongoing struggle between modernism and postmodernism. Both are forms of metatheory (Ritzer, 2001) that shape the way we see the world. Briefly, and partially, traditional modernity emphasizes differentiation, simple-location, classification, and representation. While, in contrast, postmodernism is more about process, movement, interpretation, and change. The difference makes for interesting dialog (Chia, 2005), both inside each camp, as well as between them. Yet, drawing lines between the two is a modern approach and dialog is a postmodern approach. Both have something to offer the present paper that will help us to understand and advance scientific metatheory.

The potential benefits of advancing the science of metatheory are profound. First, by developing new metatheory, we gain the ability to become more effective in the application of theory for the alleviation of social ills and the optimization of the human condition. Second, and closely related, by working from a metatheoretical perspective, we gain the opportunity to understand and integrate theories across disciplinary boundaries. The insights and capabilities to be gained, for example, by linking human development and public policy are quite intriguing.

In first part of this article, I will review existing definitions of metatheory in hopes of finding a more complete, more useful, and less pejorative definition. In the second part of this article, I will present an outline for a scientific study of metatheory based on an authoritative, modern definition as a step toward legitimizing the study of metatheory, and the subsequent development of more effective theory. Third, I will present a postmodern view of science, combining and reflecting on multiple views of what it means to be a science. Fourth, I will combine the two in an integral approach that avoids the main concerns of each camp and combines the best of both. And, importantly, what seems to offer the most workable directions for a science of metatheory.

Many Understandings of Metatheory
